You should strongly consider controllers from S-Comm. Outstanding workmanship and durability, and their new model (7K) stacks up well with anyone else on features.

3298. MFJ 1024 Active Antenna?

Newsgroup: rec.ham-radio
Date: 1989-10-13 23:51:25 UTC
From: rrw@naucse.UUCP
Message-ID: <1745@naucse.UUCP>
Source record: 16324

I've been thinking about buying an MFJ 1024 active (receive only)
antenna to mount on top of the engineering building here in order
to bring in some signals to use in labs on RTTY and FAX circuitry.

Currently we have no antenna facilities, and at least for the present
large antenna installations are not possible. The MFJ can be remotely
mounted (comes with 50 ' of coax with the external mount kit), and
is broad band - 50kHZ to 30 Mhz.

I'd be interested in anyone's opinion of this equipment... how
sensitive, how resistant to noise, etc etc etc...

Please either E-Mail me or post here (I *READ* this newsgroup!)

Many thanks & 73's

I think that an additional avenue to persue is to follow the normal channels for comments/suggestions/etc for the small segment of the ARRL located in Newington, CT

We all have Section Managers, Vice-Directors, and Directory who are [supposed to be] very interested in the concerns of the ARRL. (ARRL == It's Members) They might find your comments interesting if you are a non-member, but they carry weight if you Are a member.

The directors make recommendations to the executive board and ALL the employees are under the direction of the Exec board (I think it's really called Exec Committee)

It is a shame that the cut was needed, but sometimes a direct attact doesn't work as well as "proper channels", yea I know sounds like a line of crap, but as long as you are sending letters, it can't hurt!

Good Luck
73, Tom

In article <8910110718.AA27974@ucbvax.Berkeley.EDU> IZZYH79@OAC.UCLA.EDU writes:

[stuff about the FCC and ARRL not doing anything about illegal
operations on and near 10m band deleted]

In additional area of concern here is that there appears to be
a group of truck people taking over Marine FM frequencies in the
inland areas. I somehow suspect that the reason behind Radio Shack
going into Marine FM and 10m ham gear is the ILLEGAL market, rather
than the legal market.

I myself am one of the people trying to move towards ham from
CB, and if my work load ever drops low enough that I have time to eat,
i'll finish studying to get licensed. In the meantime, I have never
considered running illegally in any band (except for the rare fantasy
of building a transmitter sufficiently powerful to melt the equipment
of the scum with the linear on 27mhz...I guess we all have something
to dream about).

One thing to be careful about is creating 'bad press' towards
radio in general. A misguided attack on illegals could be picked up
by the public at large and pointed right back at us (someone here uses
the term "assault radio" as an example of what I mean). We don't want
an environment where anyone with a large antenna array and high power
is suddenly EVIL.

Well enough rambling for now...

- Dave

:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2064--Oct. 10, 1989 ::
::::::::::::::::::::::::::::::::::

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Ingemar Sandberg.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2064

--------------------------------------------------------------------------------

ELECTRONIC MEDIA SUMMIT--Today's English edition of SCDX features an
interview about the Firsy World Electronic Media Summit, held last week in
Geneva. We'll return to the summit in an upcoming program.

SATELLITES--One of the transponders on France's TDF-1 direct broadcast
satellite has broken down. That means that one of the two France Inter radio
channels using the satellite is off the air, the program called Hector. The
other program, Victor, is still heard.

So far the satellite only has one TV service, La Sept, which is still on the
air. The other allocated TV services, Canal Plus in French and German, Sport
2/3, Canal Enfants, and Euromusique, are still negotiating their contracts,
and they are using the breakdown to try to lower the price.

France Inter says Hector will return to the air when TDF-2 is launched in
February.

On the other hand, Germany's two direct broadcast satellites, Kopernicus and
TV SAT-2, are now in service. Between them the two satellites have 17 TV
channels at their disposal.

Twelve are on Kopernicus, which is now seen as a powerful competitor to
Astra, and some of the German channels expected to appear on Astra have
chosen Kopernicus instead. These all use the PAL system, and there are 12 GHz
transponders for Pro 7, Tele 5, WDR, BR 3, and DSR. In the more common 11 GHz
band you can find RTL Plus, ARD 1 Plus, 3 Sat, and Sat 1. One channel is
reserved for digital radio, one for telephone traffic between the Federal
```

Republic and West Berlin, and two for the fast communication of data.

Four of TV Sat-2's 5 transponders have been allocated, to RTL Plus, Sat 1, 3 Sat, and ARD 1 Plus. So there's a bit of duplication there. And almost all of the Kopernicus channels are also on Intelsat V F-15, at least for the time being. They'll probably disappear from there in the future. (BBC Monitoring and "Elektronikvaerlden")

ASCENSION ISLAND--At the end of September the BBC brought two new transmitters into operation on the South Atlantic island of Ascension in order to give better reception in Africa and Latin America. The GBP 1 million development is part of a GBP 100 million scheme to raise the World Service's audience, estimated at 120 million. ("The Daily Telegraph" via Bradley Allen, England).

CANADA--Radio Canada International broadcasts in English to Western Europe: Mondays-Fridays: 06:15-06:30 and 06:45-07:00 on 6050, 7155, 9740 and 11840 kHz via Daventry in the U.K. and from Sackville on 6150 and 9760 kHz. (French is at 06:00 and 06:30 hrs.) Mondays-Fridays at 19:30-20:00 on 5995, and 7235 kHz via Daventry and 11945, 15325 and 17875 kHz via Sackville. Daily at 22:00-23:00 on 11945 and 15325 kHz via Sackville. (Anthony Barrett, England)

FINLAND--Radio Finland has not verified a listener report since 1980. But now there's a chance to get a special QSL card. The Helsinki DX Listeners Association is presenting a special 60 minute program, to be heard this Saturday, October 14th, at 11:00 hrs. This will be on 6130 kHz, and will mostly be in English, and partly in Spanish. This is a special transmission, outside the regular Radio Finland programming. (Juhani Niinistroe, Radio Finland)

WEST GERMANY--Transmissions in Polish from Deutschlandfunk between 19:00 and 19:30 and in Czech and Slovak between 19:30 and 20:30 are broadcast via the SSB feeder from Frankfurt am Main on 7917.5 kHz besides the usual medium wave frequency of 1539 kHz. (Peter Herrmann, West Germany)

Radio Free Europe in Romanian is broadcast via the SSB feeder from Holzkirchen on 5125 and 5295 kHz between 19:55 and 22:55. (Peter Herrmann)

GUAM--Trans World Radio (KTWR) broadcasts in English to Africa since October 1st at 16:00-17:00 on 11805 kHz. The station has also increased Russian language programming effective October 1st: Current schedule lists 08:30-09:00 on 11665 kHz and 11:00-12:00 on 11805 kHz. "Pacific DX Magazine" is on the air on Saturdays at 10:00 to Australia on 11805 kHz, to India at 15:15 on 11650 kHz and on Sundays at 08:45 on 15210 kHz to the Far East. (Bill Damick, "Pacific DX Magazine", Guam)

IRAN--The Voice of the Islamic Republic of Iran broadcasts to Europe as follows: English at 19:30-20:30 on 9022 and 11895 kHz; French 06:30-07:30 on 9022, 9745 and 15084 kHz and 18:45-19:30 on 9022 and 11895 kHz; and German 18:00-18:45 on 9022 and 11895 kHz. (Cees van Oudheusden, Netherlands)

ISRAEL--The Voice of Peace is a popular offshore pirate station operated by peace activist Abie Nathan near Tel Aviv. Last week an Israeli judge sentenced Abie Nathan to 6 months in prison for meeting with Yasser Arafat and other leaders of the Palestine Liberation Movement. He is the first Israeli to be jailed under what Reuters describes as a much-flouted anti-terrorism law banning unauthorized contacts with the PLO. (Reuter)

ITALY--The English programs from Adventist World Radio, Forli have been extended to one hour while the broadcasts in French only lasts for half an hour. The current schedule reads: 06:30-07:30 in English on 7125 kHz. All other broadcasts are on 7257 kHz, namely: 07:30-08:00 French, 08:00-09:00 Italian, 09:00-10:00 German, 10:30-11:30 English, 11:30-12:00 French, 12:00-13:00 Italian and 13:00-14:00 German. (Salvatore Placanica, Italy)

JAPAN--Radio Japan in English at 21:00 uses 11765 kHz instead of 11800. The transmission at 01:00 is on 17775 kHz instead of 17825. (Ashoka Patel, India)

KUWAIT--Radio Kuwait uses the unannounced frequency of 21675 kHz during the English broadcast around 18:30. 11665 kHz is in parallel. (Bengt Johansson, Portugal)

NORTHERN MARIANA ISLANDS--KYOI has been off the air for some time being upgraded and rebuilt. When it returns to the air at the end of October it will have a new call sign: KHBI - HBI standing for Herald Broadcasting International. Herald Broadcasting is the Radio and Television branch of the Christian Science Monitor, which also owns WCSN in Maine, and WSHB in South Carolina. (Robert Day, England, Cees van Oudheusden and Salvatore Placanica)

The German program from KFBS is broadcast on Sundays at 15:30 on 9465 kHz. (Gerd Wedemeyer, West Germany)

PAKISTAN--English from Radio Pakistan at 17:18-18:00 is on 11570 and 15200 kHz. (Cees van Oudheusden and Salvatore Placanica)

PARAGUAY--A verification letter from Radio Nacional indicates that the station still uses the frequency of 9735 kHz. (Arthur Cushen's DX World)

SYRIA--Radio Damascus has added Portuguese to its Latin American service: at 00:30 on 12085 and 15095 kHz. (Pasquale Salemme, Italy)

TAIWAN/USA--There is a frequency change concerning the Voice of Free China's broadcasts in French at 20:00 and German at 21:00: 15270 kHz replaces 9785 kHz which comes direct from Taiwan. Remaining unchanged are from Taiwan on 9765 and 11860 kHz and from WYFR in Florida on 15345 and 17612.5 kHz (Andreas Kruppert, West Germany)

The Voice of Free China via WYFR is heard at 05:00 in Chinese and at 07:00 in English on the new frequency of 5950 replacing 5985 kHz. The English schedule is announced: 02:00-03:00 and 03:00-04:00 on 5950, 9680, 15345, 11765 and 7455 kHz; 02:00-03:00 on 11860 and 11740 kHz; 03:00-04:00 on 11745 kHz; and 22:00-23:00 on 9955, 15345, 17612 and 15370 kHz. The latter frequency is intended for Australia and New Zealand. (Arthur Cushen's DX World and Ciro Capotorto, Italy)

UNITED KINGDOM--The London commercial station LBC is being reorganised: "London Talkback Radio" consisting of discussion programs, will be broadcast on 1152 kHz medium wave. "LBC Crown FM" on 97.3 MHz FM will carry continuous news. (Bradley Allen and John Barker, England)

Radio City in Liverpool is introducing an all-talk format "City Talk" to go out only on medium wave 1548 kHz. (Bradley Allen)

UNITED STATES--WHSB has recently made a couple of frequency changes: the transmission at 08:00 to Australia uses 13760 kHz instead of 17855 and the 20:00 transmission to North America and Europe uses 15225 instead of 15390 kHz. (Salvatore Placanica)

USSR--The Soviet Baltics republics are starting to assert themselves, and Radio Vilnius in Lithuania has a new English schedule, reported on CompuServe by Robert Horvitz and Gifford Mead. Broadcasts to Europe are at 09:30 hrs on 666 and 6100 kHz. AT 10:00 hrs these frequencies are joined by 7400, 11790, 13645, and 15455 kHz.

Programs to North America are at 23:00-23:30 hrs on 9610, 11675, 15180, 17665, and 17690 kHz. (Robert Horvitz and Gifford Mead via CompuServe)

Radio Moscow's home service programs as well as their World Service are broadcast over several SSB feeders. During the time period 17:00-20:00 the Radio Moscow World Service can be heard on 8122, 9210 and 16250 kHz. The "Mayak" program on 9250, 18195, 18460 and 18870 kHz. The 3rd home service program is heard on 14437 kHz. Other home service programs go out on 9145, 10995 and 16020 kHz. (Peter Herrmann)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
02:30 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21655 kHz (East Africa)
18:00 hrs on 1179, 6065, and 7265 kHz
21:00 hrs on 1179, 9655 and 11705 kHz
23:00 hrs on 1179 kHz
00:00 hrs on 1179 kHz

And to Asia and the Pacific:

12:30 hrs on 15190, 17740, and 21570 kHz
14:00 hrs on 11905 and 17740 kHz
01:00 hrs on 7225 and 9640 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 29 contributors this week Good Listening!

>Sorry, I didn't know "for sales" were taboo

Heck, Bob, don't worry about it. It isn't as though the FCC was going to jerk your ticket. Other newsgroups allow (or apparently tolerate) such "for sale" postings, and it would be a natural mistake to make. I sure didn't know there was any such prohibition. And if anyone flames at you or tries to put you down for an honest mistake, they are neither a gentleman nor a scholar, and don't belong on the air or at a keyboard.

Converting from 72Mhz tp 50Mhz requires a "band change" of the RF circuits...NOT an easy matter!!!! Remember, you must change your rcvr also if you wish to use the system....and THATS not easy too.....I have moved UHF gear from 480 to 420Mhz but a change of 60Mhz is a small percentage of 480Mhz whereas a change of 20Mhz is a LARGE percentage of 72Mhz...thats why its necessary to do a band change which involves every tuned circuit...not an easy task!!!
73, Chris WB5ITT (dont forget the new 6M freqs...donot use the 53Mhz range!!!!!the 50.8-51Mhz range is NOW the area for RCs)

Damn shame the FCC didnt pass the NPRM years ago that wouldve required
proof of license for sales of amateur TRANSMITTING equipment!!!!
Even the big manufacturers (RL Drake, etc) were behind it and the San
Antonio Amateur Repeater Association had submitted a simple plan that had
a LARGE following!!! But the wonderful people in Washington bowed to
stupid thinking and killed the idea.......Shame!!!
(Guess things never change when it comes to dealing with Big Brother!)

> >I picked up some RG-8/X coax, some PL259 connectors (silver plated) and
> ^^^^^^
> ARE YOU SURE?!? The adapters are for the smaller RG-58/U ONLY!
> PL-259's are meant to handle RG/8 or RG/11 DIRECTLY!
> >the UG-176 adapters for the connectors at a local hamfest. I want to
> >build up some better coax for my dipole than what I am using now.
> >

Amphenol lists two different adapters for the PL-259 in thier catalog:

UG-175 -- RG-55,58,141,142 (.209" I.D.)
UG-176 -- RG-59,62,71,140,210 (.257" I.D.)

They list nothing for RG-8/X specifically. In the back of my mind I
seem to recall that Radio Shack had an adapter that would handle RG-8/X
but I could be mistaken. My Belden catalog lists RG-8/X as having an
O.D. of .242", so it looks like the UG-176 adapter should accomidate
it.

>Unfortunately, in the pre-glasnost era, that proved impossible.

I was curious about the "TUVA SSR" and so looked it up in Encyclopaedia
Britannica. Here is what I found:

Correct name: Tuva Autonomous Soviet Socialist Republic
(or Tuva A.S.S.R.). Note that it is *not* a Union republic but part of
the R.S.F.S.R., or Russia (loosely speaking) , which is itself a
federated republic. All Union republics have the (theoretical) right of
secession; autonomous republics do not. A.S.S.R.'s are administrative
divisions based on nationality, somewhat different from oblasts.

Some history of the Tuva A.S.S.R.:
Part of the Chinese Empire until 1911
1914: Russia took country under its protection after fomenting a
separatist movement
1921: Independence declared: Tanna Tuva People's Republic
1944: Annexed by the U.S.S.R., made an autonomous oblast of the
R.S.F.S.R.
1961: Status raised to A.S.S.R.

> and I mean litterally all the channels, go silent.

Something must be wrong with the front end of your receiver. Granted there are definitely some dead spots in the country, but I live outside of the major metro areas and the channels are still quite crowded. It depends on where you go. Here in Urbana-Champaign, I hear usually 5 or 6 active CB channels during an evening. When visting my parents in West Viginia in a town of 6000 people, there are often 12 or more busy channels. Incidently there is more two meter repeater activity there as well.

Yes, the UG-176 works. RG-8/X has basically the same O.D. as RG-59.

In article <30500234@ux1.cso.uiuc.edu>, phil@ux1.cso.uiuc.edu writes:
>
> I'd like to find out some info about the Icom IC-275:...

I own an Icom IC-275H and have been happy with it, using it
mainly for FM and listening in and out of the 2 meter band.
The dozen or so SSB QSOs I've had using it has shown it a good
performer in that mode, too.

As received from the factory, the IC275 receives 138-174 MHz.

Reception within the ham band is very good. However,
I have noticed a difference in reception performance when
listening outside 2 meters. You can hear the level
of the background noise go down as soon as you tune beyond
the ham band. It's a discrete type of change so I assume
they are switching something, like a band pass filter.
I think different sythesizer circuitry may be used outside the band
also.

Outside 2 meters, the reception is sensitive enough for the
type of listening I do, but the 275H is prone to images above
148 MHz -- seemingly a bit more than my old Bearcat 300s, for
example.

I have not modified the 275H to transmit outside 2 meters so
I can't offer information about such a modification, nor about.
the computer interface either.

You might want to consider installing the high stability oscillator
option, although I have not.

My 275H receiver will change frequency about 1.6 - 1.8 kHz during the
first hour or so after initial power on. The drift is slow, so one
would not normally be aware of it except:

1) the discriminator meter shows off center reading,
and more importantly

2) the memory scan function will skip active channels
because the "window detector" circuit thinks
the signal is too far off frequency to be
valid.

Fortunately, the RIT control can be easily used to compensate
for the difference. By the way, the memory scan is very fast.

When I bought my 275H, the reference oscillator was aligned
perfectly for operation when the rig was first powered on.
I realigned the oscillator after a 1 hour warmup instead.

I compared the Kenwood TS-711A, the Icom 275A/H, the Yaesu
FT726R, and FT736R before buying the Icom and would make
the same choice over again.

3313. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-10-15 01:22:03 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8910150704.AA11984@ucbvax.Berkeley.EDU>
Source record: 16190

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

SpaceNews

MONDAY OCTOBER 16, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* SHUTTLE NEWS *

The Space Shuttle ATLANTIS is scheduled for launch on mission STS-34 on Tuesday 17Oct89 at 12:57 PM ET (1657 UTC).

* OSCAR-9 NEWS *

Current information suggests that UoSAT-OSCAR-9 re-entered the earth's atmosphere and burned up on the morning of Friday 13th October, after over 8 years of operation. The last telemetry received in the UK was at 2200 GMT on Thursday 12th October. The University of Surrey Command Station would be interested in receiving any telemetry taken after this time.

* UoSAT D/E NEWS *

Two weeks ago, Arianespace postponed the launch of the rocket which is to carry SPOT-2, UoSATs-D and -E and the four Microsats into orbit. Early this week, UoSAT and AMSAT teams were formally notified that the new launch date is 19 January, 1990.

The launch delay will allow for more thorough testing of UoSAT-D and -E. This began on 29Sep, when engineers from the European Space Agency Technical Center (ESTEC) came to perform final check-out of the Transputer Data Processing Experiment (TDPE) and its interface to the UoSAT-E CCD camera. These tests demonstrated the potential complexity and flexibility of the UoSAT D/E onboard onboard data handling system. Ground station software was used to load TDPE programs as "blocks" to the standard UoSAT FORTH DIARY running on the 1802 On-Board Computer (OBC). The OBC then loaded these programs to the TDPE using the Transputers' built-in serial bootloaders using the UoSAT Data Sharing (DASH) bus. The TDPE then commanded the CCD camera to take a picture, the picture was transferred from the camera to TDPE at 5 Megabits/Second, and finally the TDPE downloaded the image at 9600 bits/sec. to the "ground station" using a simple asynchronous packet format.

The optics and the electronics of the UoSAT-E CCD camera were designed by engineers at UoSAT. The design is expected to provide Earth imaging with a

resolution of approximately 2.7 kilometers and an image size of 740 x 960 km. The image is 386 pixels X 244 pixels with 8-bits of grey scale per pixel. Images will be transmitted on the UoSAT-E downlink to all radio amateurs, probably using AX.25 packet radio (generated by yet another on-board computer, a CMOS Z80).

The mandatory flight-acceptance vibration tests were conducted this week back at the Royal Aerospace Establishment, and both satellites passed without hitch. UoSAT-D and -E are now in the clean room at the University of Surrey, where they will undergo nearly two months of operational tests, and provide testing grounds for the PACSAT and experimental software which is now under development at Surrey.

[Story via OSCAR-11]

* OSCAR-13 NEWS *

For yet unexplained reasons, the Integrated Housekeeping Unit (IHU) on-board OSCAR-13 failed sometime at or near perigee between orbits 1012 and 1013. AO-13 command station DB2OS reported that the failure occured between 0700 and 1000 UTC on 09Oct89. NO transponder operations are allowed until spacecraft operations are fully restored.

* MIR NEWS *

Launch of Module-D (Service Module) is expected to take place today, 16Oct89. This week, Progress M-1 will undock from Mir's forward docking port and will be sent into a destructive re-entry. On 23Oct89, Module-D will dock with Mir at the forward axial port and will later transfer to one of the axial ports using its manipulator arm.

* RS10/RS11 NEWS *

Yes, we DO have some RS10/RS11 news this week! Rich Gopstein recently monitored these spacecraft and found RS10 to be active on Mode KA.

* ARIANESPACE VIDEO *

European readers of SpaceNews might be interested to know that Arianespace transmits live video of their launches on Eutelsat (usually ECS 1 F2) starting approximately 30 minutes before scheduled launch time. The video is easily copied throughout Europe using a TVRO earth station having an antenna diameter of 1.5 meters or greater.

[Thanks to Alan, GM4MUN]

**** UoSAT-OSCAR-11 BULLETIN - 200 13th October 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT-OSCAR-9 **

Current information suggests that UoSAT-OSCAR-9 re-entered the earth's atmosphere and burned up on the morning of Friday 13th October, after over 8 years of operation. The last telemetry received in the UK was at 22:00 GMT on Thursday 12th October. The University of Surrey Command Station would be interested in receiving any telemetry taken after this time.

** UoSAT-D and -E Status **

Two weeks ago, Arianespace postponed the launch of the rocket which is to carry SPOT-2, UoSATs-D and -E and the four Microsats into orbit. Early this week, UoSAT and AMSAT teams were formally notified that the new launch date is 19 January, 1990; the launch campaign will start some six weeks earlier, at the end of November.

The launch delay will allow for more thorough testing of UoSAT-D and -E. This began on 29 Sept., when engineers from the European Space Agency Technical Center (ESTEC) came to perform final check-out of the Transputer Data Processing Experiment (TDPE) and its interface to the UoSAT-E CCD camera. These tests demonstrated the potential complexity and flexibility of the UoSAT-D/E onboard data handling system: Groundstation software was used to load TDPE programs as "blocks" to the standard UoSAT FORTH DIARY running on

the 1802 On-Board Computer (OBC). The OBC then loaded these programs to the TDPE using the Transputers' built-in serial bootloaders using the UoSAT Data Sharing (DASH) bus. The TDPE then commanded the CCD camera to take a picture, the picture was transferred from the camera to TDPE at 5 Megabits/Second, and finally the TDPE downloaded the image at 9600 bits/sec. to the "groundstation" using a simple asynchronous packet format.

The optics and the electronics of the UoSAT-E CCD camera were designed by engineers at UoSAT. The design is expected to provide Earth imaging with a resolution of approximately 2.7 kilometres and an image size of 740 x 960 km. The image is 386 pixels X 244 pixels with 8-bits of grey scale per pixel. Images will be transmitted on the UoSAT-E downlink to all radio amateurs, probably using AX.25 packet radio (generated by yet another on-board computer, a CMOS Z80).

The mandatory flight-acceptance vibration tests were conducted this week back at the Royal Aerospace Establishment, and both satellites passed without hitch. UoSAT-D and -E are now in the clean room at the University of Surrey, where they will undergo nearly two months of operational tests, and provide testing grounds for the PACSAT and experimental software which is now under development at Surrey.

I would have to concure with the first poster. In the last 2.5 years
I've driven Chicago-Fairbanks-Chicago, Chicago-Halifax-Chicago,
and Chicago-Key West-Chicago and have found this;
In the metropolitan areas, you could fit all extant conversation on a total
of 3-8 channels. In the rural areas, other than channel 19, there was
almost NO use of the remainding channels. My trips included heavy
urban areas (New York City) as well as desolate outback (Yukon Province)
and silence is what we heard the most (I like to scab the channels a lot
so that was no problem either). Could be that the Urbana area has some
"hard-core" CB fans. BTW- there's nothing wrong with my transceiver,
it works fine.

In the October 9 issue of Info World there is a story stating that Groupe
Bull will be keeping the name of Zenith for the computer line. This came
from Bull Exec V.P. Gerald Vennard. No mention was made of the Heathkit
kit line.

3318. USING THE YAESU FT767GX FOR OSCAR

Newsgroup: rec.ham-radio
Date: 1989-10-15 22:46:18 UTC
From: AFZ1@PSUVM.BITNET
Message-ID: <89288.184618AFZ1@PSUVM.BITNET>
Source record: 16193

Hello everyone ---

The idea of using the FT767GX HF/VHF/UHF rig have been plaguing my mind.
The rig is basically an HF rig with the option of plugging in the 6, 2m es
70cm modules. Can the unit with the 2m es 70 cm module be used for satellites
QSOs? With both the modules plugged in, the rig can work split. However, it
cannot work duplex; only simplex.

I'm thinking of getting on to the OSCARs es hve the FT767GX with the 2m
module. I'm contemplating on whether to get the 70cm module or get a
seperate 440 rig. Getting the module wud be a cheaper option.

Any suggestions and help regarding this matter wud be vry much appreciated.
PSE E-MAIL TO ME DIRECT AS I DO NOT OFTEN GET ONTO THE NET. OR SEND IT
VIA PACKET.

3319. Building A (Very) Low Cost Repeater

Newsgroup: rec.ham-radio
Date: 1989-10-16 05:20:34 UTC
From: noel@ubbs-nh.MV.COM
Message-ID: <149@ubbs-nh.MV.COM>
Source record: 16194

I have it in mind to build a (very) low cost repeater for use here as well as for use as an "emergency" repeater.

The idea that I have is to use two handhelds, probably two late model synthesized rigs.

As I envision it one tranciever would be used primarily for the reciever, while the other would be used as the transmitter. A homebrew, or kit controller might be added at a later date as well as a linear amplifier for extending the range as necessary.

I'd appreciate hearing any comments, suggestions or actual plans for such a set up, as well as any comments concerning possible low cost antenna confirgurations.

For the purpose of experimentation I have available an Icom IC-2A and an IC-02AT, but if feasible, I would probably adapt the idea for use with something like a Tempo One (? is that right, boy its been a long time! ?) or one of the older synthesized handhelds such as one of the heathkit models.

Thanks!

Noel

Or "drop business as usual" and pitch in with unsolicited H&W traffic, or to act as a self-appointed policeman, or even to deliberately jam an emergency net and generally make life even more miserable for those trying to do some good.

The more I listen around, the less and less difference I can hear between the ham bands and CB. The hams are not all as pristine as they would have you believe. Even more astoundingly, not all CBers are the Neanderthals that the hams would have you believe they are. In particular, listen to the SSB activity on the high end of the (legal) CB band and in the (illegal) freeband portion. Except for the lack of callsigns and the apparent inability to standardize on a particular sideband, I challenge anyone to tell the difference between these guys and typical HF ham QSOs. I sure can't.

>Phil

Good point, Phil. While we're at it, I've always wondered about another
aspect. On CB, when one tries to talk while someone else is transmitting,
we call it "walking on him" and rude and neanderthal and just totally
disgusting. On the ham bands, on the other hand, we call it DX and contesting
pileups and have magazines dedicated to the sport (QST) and newsletters and
such and call it a "good thing". What's the difference.

Another question. If a CB'er gets himself a 'lineer, we call him a
slime-bag and wish the full might of the FCC on him and would put him
in jail longer than a rapist. If, on the other hand, a ham gets
a "California Kilowatt" complete with the 480 volt 3 phase utility drop
to run it, we say he has a "nice, loud signal" and secretly plan to
get one just like him. Again, what's the difference?

Just sittin' here musing over the first cup of coffee....

John

3323. some IC37 mods

Newsgroup: rec.ham-radio
Date: 1989-10-16 13:29:08 UTC
From: rfc@briar.philips.com
Message-ID: <65610@philabs.Philips.Com>
Source record: 16202

copied from packet:
Msg# TSP Size #Rd Date/Time MsgID From To
6051 BF 2985 0 1010/0541 1631_N2EYR W2JIA ALL@ALLBBS
Sb: IC37 mods.

Here is a list, transcribed from "220 Notes", of modifications for the ICOM model IC-37A. The 27A and 47A should be very similar:

"We have been using [this mod sheet] in the Southwest Coast ever since the [IC-]'37 was in production. This one is the latest revision.

"The design problems of the '37 are greater than ICOM would lead you to believe. The [IC-]'38 has solved a great majority of the '37a problems. However, the microphone and the UHF pigtail problems still remain.

"The fix for the microphone on both rigs is the same. [see below] The fix for the UHF pigtail on the '38 involves removing the pigtail, and installing a bulkhead chassis mount BNC connector in the hole left by the pigtail assembly. Some elongation of the BNC connector holes is necessary for a good fit. A short coaxial jumper may then be installed from the board to the connector.

"Now, here is the official Condor Connection IC-37 modification sheet.

"1. To restore high-frequency receiver audio response, replace C-103 on the main unit with a .0022 uf mylar capacitor (that's 2200 pf).

"2. To restore LOW-frequency receiver audio response, replace C-106 with a .22 uf mylar capacitor.

"3. To eliminate the distortion in the transmit audio, install a 4.7k ohm resistor inside the microphone case, in series with the white lead coming from microphone element. Once the resistor is installed, set the DTMF level pot to the middle of its range (this pot is the only one inside the microphone case). To complete the mod, set R88 inside the radio to the desired "mike" level.

"4. To improve the receiver sensitivity, power output, SWR at the radio, and reliability, remove the RG-58 pigtail and the UHF connector extending from the rear of the radio. Install a BNC chassis mount, screw-in connector (UG-1094/U)

in the hole left in the back of the radio. The new connector will screw in as if the modification was done at the factory.

"5. To greatly reduce chassis heating in the receive mode, remove the following components: R66, R67, R68, Q32, D42, and D44 in the main unit. Install a 7808 [3-pin voltage regulator] on the transmitter power amp shield behind the space reserved for the optional voice synthesiser. Thermal compound is recommended. Hook the input of the 7808 to the point where R67 and R68 used to connect. Hook the output of the 7808, in series with a 1N4001 diode, to J14-1. The cathode of the diode goes to the connector goes to the connector, and the anode goes to the 7808.

"---Mark Gilmore, WB6RHQ
Newbury Park, CA."

One note on the above - the
BNC connector mentioned for
the x7-series radios is sold
by Radio Shack as 278-105,
$1.39 each.

Note: I haven't tried these, proceed at your own risk. WA2ISE

You're right, of course. Also, many of the "communications team" were actually suckered into providing warm bodies with their own transportation for other uses and the fact they can talk to each other on the radio is not made use of. I can remember many events where we hauled pop, operated the sag wagons for runners who pooped out, etc., and the committee made virtually no use at all, indeed, took no notice of the fact we had radios.

I first tumbled to this when I noticed how little real difference it made whether our club group had a large or small turnout for these events. Two or three guys willing to burn up their own gas was all the committee really needed.

>directly to the "field coil" connection on the alternator?
>Thanks for your help!
>Mike Koziol WA2BRX

One option is to install a voltmeter and forget the idiot light; it comes on if there is a bad connection in the fuse block.

Bad fuse blocks are a problem with all VW Rabbits, at least of the early '80s. JC Whitney Auto Parts of Chicago sells replacement fuse blocks but I don't trust them to be identical to the originals. Best solution I know is to identify the proper wires, cut them off the fuse block, install in-line fuses. I've done it several times in my '80 diesel which has 134000 miles. A shop manual and a telephone-type tone generator and capacitive detector are useful. BTW, the VW Rabbit diesel is a great radio platform-- heavy-duty alternator and battery, and no ignition noise.

3327. Icom 28H Wipes Out Climate Control

Newsgroup: rec.ham-radio
Date: 1989-10-16 14:29:58 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <174135@Wayne-MTS>
Source record: 16212

N8LAT presented me with this problem; perhaps one of you has a
solution, or has come across it before:
He has an Icom 28H mounted in his Cadillac. Whenever he transmits
at high power on or near 148MHz, he wipes out the climate control.
There's no problem on low power, or at 145-146 at high power, he reports.
Antenna is on a clamp-on trunk-mount bracket; ground screws are firmly
screwed through the paint.
My guess is that he's getting radiation off the feedline near the
rig, owing to a less-than-perfect ground and a less-than-perfect match
at some frequencies, but as he lives far from me I haven't seen the
actual installation, nor have I been able to put my VHF SWR meter in line
to check it out. (I've suggested he check this).
Any experience or hints?

3329. the un-net on 10M

Newsgroup: rec.ham-radio
Date: 1989-10-16 17:13:19 UTC
From: rusty@cadnetix.COM
Message-ID: <9912@cadnetix.COM>
Source record: 16206

First, I realized that I should probably make a clarification about what it is I am expecting the 10m usenet un-net to be. Its not a net, and its not a contest. Sure, I think it would be fun to get 'usenet WAS', but I don't think I'm 'paper chasing' since I would rather spend some time talking than just saying "UR 5-9 QRZed" and moving on.

That out of the way, on to a quick review of last weekend (and a somewhat disjointed review, at that! today seems to be a pretty bad day for getting transitions done well... Must be Monday):

Between 915 and 935 I talked to 3 other usenetters, 2 of them at once. The rest of the morning was spent goofing around trying to contact other people, with marginal success.

I did discover that there appear to be a lot of usenetters 'out there' who have read-only access to usenet, which I found interesting. I made the offer to Rick and Dave, and I'll make it to anyone else, that if they *must* post something (or want to reply to someone), that I'll be happy to oblige them and post or email for them.

One other thing I discovered is why my rig is not putting out full power. So week after next I should be up to full 100 watts (from around 10 or so) for the un-net, making contacts just a bit easier :-).

I'm up to 5 states for usenet WAS: NJ (WA2ILB), NY (K2ILH), IN (WN9NBP), KY (KU4A), and CO (KF0BK) (pretty sad when it takes 5 weekends to get someone in your own state! :-). I enjoyed the contacts this weekend (and all previous weekends...)

While Rick and I were talking, he mentioned the "CQ Pizza" debate, and that prompted Dave to realize that we were usenetters and so to join us. I commented later to my wife that maybe I should start calling:

CQ CQ. CQ Usenet, CQ Pizza, CQ ...

:-) :-)

I'm curious. How many people are getting active on 10 on saturday for the un-net? (Email please, and I'll count up the totals and report them. Of course, if you have read-only access to usenet, then don't worry about responding :-)

Well, I've rambled pretty badly here, so I'll quit now before

Subject: ARRL and Scanner Law

A.R.R.L. UPDATE..LATEST FROM THE LEAGUE-SPECIAL NEW JERSEY EDITION

The ARRL will actively seek alternative relief at the Federal level from
state and local so-called scanner laws.

In its filing on the Part 97 Amateur Radio Rules rewrite the League asked
the FCC to adopt a rule, tentatively numbered 96.415, for permitted
apparatus. The rule, as requested by the League, would read;

"Notwithstanding any state or local law to the contrary, and except as may
be specifically prohibited by the laws of the United States, any station
apparatus may be used in an amateur station, fixed, mobile or portable,
whether or not such apparatus is incidentally capable of operation on
frequencies assigned to another service."

The proposed rule, dealing with the possession of radio receivers capable of
reception of Police or other Public Safety communications, would restate the
Federal Government's pre-emption where local laws are in conflict with
Federal law. This conflict arises when state statute and local laws are
applied to the seizure of amateur radio equipment in the possession
of amateur radio operators and/or the arrest of the operators for
possession of that equipment if the equipment is incidentally capable of
reception of communications on frequencies other than amateur radio
frequencies.

In New Jersey several amateurs have had their equipment seized because it
was capable of receiving local government frequencies in addition to
amateur radio frequencies. The New Jersey law, NJS 2A:127-4, states that
any person who "installs or has in any automobile, a short wave radio
receiver operative on frequencies assigned by the FCC for fire, police,
municipal or other governmental uses, is guilty of a misdemeanor, unless a
permit therefore has first been obtained from the chief of the county

police, or from the chief of the police of the municipality, wherein such person resides."

Taken at its broadest term this law could mean that if you have ANY amateur radio equipment in your car it could be taken to be illegal. Why? Because New Jersey RACES is a governmental function and the law specifically bans the use of a receiver for such frequencies. This would make HF, VHF and UHF receivers illegal as RACES uses all of those bands.

The Electronic Communications Privacy Act of 1986 prohibits intentional interception of wire, oral or electronic communication, but specifically exempts, among other things, governmental, law enforcement, civil defense, private land mobile or public safety communications system, including police and fire, readily accessible to the general public. This is contained in 18 U.S.C. Section 2511(2)(g)(ii). The phrase "readily accessible to the general public" refers to the presence or absence of scrambling or encryption devices. Routine police or fire communications are not scrambled and are readily heard on amateur receivers with extended coverage.

This puts the Federal government and the state of New Jersey in opposition. The regulation of radio receivers and which frequencies may be included in receivers is a FCC, not state, function. Therefore the League will actively seek relief at the Federal level.

A.R.R.L. UPDATE...LATEST FROM THE LEAGUE-SPECIAL NEW JERSEY EDITION

Levin Pushes To Delete New Fees From Budget Bill
By JOHN FLESHER
Associated Press Writer
WASHINGTON (AP) _ Amateur radio operators would be hit with first-ever registration fees under pending deficit reduction legislation, a slap at people who perform a valuable service when disaster strikes, Sen. Carl Levin said Monday.
Senate leaders will try to remove the fees from the bill during negotiations with the House over the budget and tax package, said Levin, d-Mich.
``These are people who are critically needed in emergencies. They ask for nothing and they charge nothing,'' Levon said.
The House and Senate versions of the budget bill would levy a $35 fee on amateur radio operators, also known as ``ham'' operators, when they receive their initial licenses, which must be renewed every 10 years.
That is not much money, acknowledged Perry Williams, spokesman for the American Amateur Radio League, which represents about 160,000 of the nation's 450,000 licensed ham operators.
But he said operators would have to pay the fees each time they upgrade their licenses.
``You get kicked in the teeth for advancing your skills,'' Williams said.
It costs the Federal Communications Commission about $5 to process each license, Levin said. Higher fees than that ``would be like taxing a hobby, which doesn't make sense,'' he said.
Ham operators have played a vital role in disasters such as earthquakes in Mexico in 1985 and in El Salvador in 1986, the crash at Detroit Metropolitan Airport in 1987 and Hurricane Hugo last month, Levin said.
It was they who got word to the U.S. government of the need for troops to quell looting in the Virgin Islands after Hugo, Williams said.
The proposed fees are among provisions that would raise $43 million to cover the FCC's administrative costs in licensing radio stations, although Levin said it is not clear whose idea it was to apply the charges to ham operators.
``I haven't found anyone who defends it,'' he said.

3336. Can you tell the CBers from the HAMs??

Newsgroup: rec.ham-radio
Date: 1989-10-17 01:26:27 UTC
From: sorgatz@ttidca.TTI.COM
Message-ID: <6924@ttidca.TTI.COM>
Source record: 16214

In article <17893@bellcore.bellcore.com> karn@ka9q.bellcore.com (Phil Karn) writes:
+
+The more I listen around, the less and less difference I can hear between
+the ham bands and CB. The hams are not all as pristine as they would have
+you believe. Even more astoundingly, not all CBers are the Neanderthals that
+the hams would have you believe they are. In particular, listen to the SSB
+activity on the high end of the (legal) CB band and in the (illegal)
+freeband portion. Except for the lack of callsigns and the apparent
+inability to standardize on a particular sideband, I challenge anyone to
+tell the difference between these guys and typical HF ham QSOs. I sure
+can't.
+
Achkpht! C'mon Phil! I respect you, you're the prototype we're all striving
to BE! The key to recognizing the CBers is their colorful speech patterns.

Very few HAMS will use a patter-rap style of QSO (except on CW...as we all
are aware!) The CBer will use phrases like "no doubt about it!", "Terrible
Situation!" etc. Most Amateurs tend to avoid such patterns, they also tend
to avoid acknowledgments of the type: "Roger", "10-4" (or "4-10"), "fer sure!"
etc.

Another litmus-test for CBers is the topic thread and or it's technical
content. This is where one hears about the "teddybears" (these being a
series of superstitious beliefs that CBers carry around like a teddybear!)
Some of these 'gems' include:

"Cut you're coax in NINE FOOT INCREMENTS and the SWR'll be ONE-to-ONE! So
DON'T cut it!..just let it lie there..an' don't COIL it up either!"

"ALWAYS run a ground wire from you're antenna's shield-side to a 3ft
ground rod, to prevent lightening!"

"A bigger power supply can make your radio more 10-8! The best is to use
a 20 amp or bigger..this can make a Cobra 148 put out 50 watts!"

<<the usual misconceptions about linear amp power ratings, PEP vs. RMS>>

"Skip is totally unpredictable!"

"Grounding a radio or a linear is unnecessary if you have a 3-wire plug."

"The more modulation the better..250% is pretty-good."

"There is no difference in coax, RG58 is as good as RG213 up to 500 watts!"

"Preamp mics are no good on sideband."

"Modern Ham radios are never as 10-8 as a good old General MC9.."

"Tube linears are: Obsolete!, not as good as transistor ones!, better than transistor ones if they have 6 or more tubes!...etc."

(referring to AM) "It dont mean a thing if it aint got that SWING! So turn you're carrier down so's you get a 1 watt dead-key and set the modulation so it swings up to 25 watts on the voice peaks!"

Some of this kind of stuff is amusing, at least to me, but you cannot convince me that 'most hams' are as ignorant about basic radio electronics! Getting people to 'unlearn' this kind of junk is not always easy..
As an aside, Phil, I scan CB and look for those people who ARE into it..
..so far I have an armful of hashmarks, 3 of whom are now GENERALS! Talent is where you find it. '73

3337. More about Ham Stacks

Newsgroup: rec.ham-radio
Date: 1989-10-17 12:07:34 UTC
From: dls@genrad.com
Message-ID: <27506@genrad.UUCP>
Source record: 16207

I figured it was probably time to update y'all about the Ham Stacks.
As most of you already know, I have created some HyperCard stacks for
use on the MacIntosh computer for practicing the written Amateur Radio
tests. Available right now are the Novice Ham Stack (questions which
were good until November 1, 1989), Technician Ham Stack (questions which
were good until November 1, 1989), General Ham Stack and Advanced Ham
Stack. I am currently working on the Extra Ham Stack and will probably
have it done around early November. A friend has also obtained for me
the latest Novice questions, so I am updating the Novice Ham Stack for
the new questions now, and expect that to be complete by late October.

I have Stuffit, and have tried to use it to compress the files to place
onto one diskette. The consensus is that all four of the existing
stacks WILL fit onto one diskette....but there's not enough room left
over for UnStuffit. Therefore, if you already HAVE UnStuffit, you can
request to have them sent that way. Otherwise I'll only send your first
and second (and possibly third) choice. Right now I have ready-made
diskettes:
1. Novice, Tech, General, Advanced compressed with Stuffit
2. Novice, Tech and General Ham Stacks (Does not require Stuffit)
3. General and Advanced Ham Stacks (Does not require Stuffit)

If you wish any of these or you wish the new ones (New Novice or Extra),
please email your name, ADDRESS (DON'T FORGET AN ADDRESS), and prioritized
choices. Alternately, the existing stacks may be obtained via anonymous
FTP at tank.uchicago.edu, located in directory /pub/public. The new
stacks will be mailed to Peter (at tank.uchicago.edu) after I've finished
them.

I am still looking for someone to send me the new questions for the Technician
test. No sense in me buying them since I've already passed that test. But
if someone provides me with the questions, I will update the Technician
Ham Stack with the new questions as well.

Last but not least, I just wanted to add:
I'm OFFICIAL! I got my CALLSIGN YESTERDAY! Yea! :-)

No: the principal reason SW broadcast stations change frequencies every three/four months is because propagation conditions change with the seasons (remember the amount of daylight at the transmitter/receiver locations - not to mention wherever any "hops" take place - has a dramatic effect on the condition of the ionosphere above, and hence upon propagation.)

My thanks to all of you who responded to my question about UHF connector assembly. I have concluded that my cable is the problem. I am going to check different styles of RG-8/X to see if my cable is out of spec.

For the couple of people who thought my cable was the fat RG-8: RG-8 comes in two flavors: 8/X and 8/U. 8/U is the large diameter cable, 8/X supposedly is the same diameter as RG-59 (at least the ARRL Antenna Handbook says it is). I believe I have come across some that is slightly larger. I'll post the exact cable I have and hopefully one you RF engineers out there will have a catalog that can settle this once and for all.

I did have a better time assembling connectors for 8/U after the responses. A new chisel-type soldering tip helped greatly.

Thanks again and 73!

Yes, it can be done for less than $250.

I'd suggest the Sangean ATS-803A, which is marketed in the U.S.A. by
Radio Shack as their DX-440. It sells for about $190.

The DX-440 is small enough to be readily portable, and has all the features
needed by the ordinary SW broadcast listener. It has gotten very good reviews
from the techies, too. (See reviews in the 1987, 1988, and 1989 "Passport to
World Band Radio".)

Regarding Field day power sources.....

Wind power is fickle and not so portable.
Solar is expensive, not so good at night.

How about STEAM power.......I got the idea from one of those little steam engines i had as a kid (younger kid). Does any one know of sources of information or assemblies for a decent sized steam engine?? I should be able to spin a couple of 12v alternators at 2000 rpm with a single piston steam motor. I wonder if there are extra points for using recycled newspaper logs or other environmentally minded fuel?? Any informative discussion invited. I feel sure the creative elements in the Ham community can solve the FD power crunch.

3343. cellular phone antennas (antenii??)

Newsgroup: rec.ham-radio
Date: 1989-10-17 19:52:32 UTC
From: rachiele@NADC.ARPA
Message-ID: <8910171952.AA07349@NADC.ARPA>
Source record: 16218

Everyone is posting that putting a higher gain antenna on your cellular phone will have no effect, since the controller at the cell will automatically lower your power to the point where you are using the minimum power necessary to complete the connection reliably. I understand that part. But say you are in a valley, far from the cell, and the 6 watts ERP won't quite do the job. With a higher gain antenna, you might get say 9 watts ERP, and just be able to get in clean. Will the controller reduce your power in that case? I wouldn't think so. On the other hand, if you didn't need the full 9 watts it would reduce your power to a lower level. Seems like this would be an advantage as well, expecially if you were using one of those portable jobs, with the built in battery. Remember, we're not talking about ham radio here, where you need more power than the other guy so you can talk over him,-;) just the minimum power necessary.

3344. Usenet on 10m

Newsgroup: rec.ham-radio
Date: 1989-10-17 22:02:49 UTC
From: rusty@cadnetix.COM
Message-ID: <9960@cadnetix.COM>
Source record: 16219

Well, its me again. This time a bit more coherent, I think.

First, let me say that I'm sorry I won't be around this Saturday (the 21)
as I have certain things to do (callsign tapes and a meeting, to be exact).

Also, it has been brought to my attention that some of us may not really
be interested in working 'only the U.S.'. Thats fine by me. If you get
on 10m and realize just how good it is and decide to go for France,
Japan, Africa, Holland, Columbia, or England, don't let *me* stop you! :-)

(And I mention all those countries because I've *heard* them well enough
to believe that I should have been able to work them if my radio was just
putting out the 100 watts its supposed to!)

But, if you would rather talk than seek DX, thats fine too. I've been
spending the first hour or so looking for Usenet folks, than I'll
switch to looking for anyone at all who seems loud enough for me to
be able to talk to them, so I've kind of been doing both jawing and
'UR 59 QRZed'-ing (even though I've never made a contact outside of
the N.A. continent yet....).

I've also gotten mail from someone in NJ who expects to be on this
Saturday, so don't skip out (pun partially intended :-) just because
I'll be off the air. (And please don't think I think that I am so
important to the 10m un-net that my being gone will make a big impact.
I just wanted to make it clear that I am just another participant to
it.)

So, all you Novices and Techs out there: Get on 10 meters, you might
be surprised who you work!

Oh, ok, I'll get off my soapbox now..
.
.

Just another Tech who's having a good time on 10m

-- rusty

(and who would be having a better time if his stupid radio would
work as well on 28.0-28.5 as it does everywhere else :-(

P.S. for those of you outside the USA who are hearing about the
'usenet un-net' for the first time, its a loose association of
usenetters who get together on 10m at the freqs in my .sig,
on 'saturday' at the times below.

P.P.S. When the time changes, I plan to keep the un-net starting
at the same LOCAL time, not the same universal time! So we
will change it to 1600 to 1700 (I think thats the right direction
I'll figure it out when the zone changes....).

so, 73 and I'll probably not see anyone on the un-net until after
October 28, since that is the CQ WW thing, and I expect everyone to
be chasing DX at that time. I will probably show up at the normal
time/place anyway, but I don't expect much action nor free spectrum...

3345. Re: KENDECOM MARK 4 REPEATERS

Newsgroup: rec.ham-radio
Date: 1989-10-18 00:41:09 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500238@ux1.cso.uiuc.edu>
Source record: 16229

Since the topic of repeaters is up again, I'll ask something which I tried to ask once before, but because of not knowing some things I didn't know then, I asked effectively the wrong question.

To those of you who have set up repeaters before, other than when you use RF sections and controllers designed for each other, what kinds of problems do you run into interfacing brand A radios with brand B controllers? I'm looking for typical cases, and in particular I am interested in learning just what kinds of interfaces are available on typical equipment and the electrical parameters.

I am interested in setting up a repeater, but I also want to have rather extensive low-level control over the repeater as well. I see no way to do what I want to do short of writing (or hacking) the microprocessor code (as opposed to the "programmability" controller manufacturers advertise their machines are capable of). People have "reverse engineered" packet TNC's enough to develop new programs to run on them (e.g. Net/ROM), but has anyone done this for commercial (for ham market) repeater controllers? I described several of the features I wanted to have my repeater do to an engineer at Sprectrum Repeaters (I was way beyond the sales people) and he said it sounded like several thousands of dollars worth of custom processor programming. Well... we know hams don't do things that way; and since I am a programmer, why should I pay for someone else to do what I could do?

So, what are the experiences out there regarding repeaters and their controllers? Should I build my own controller (perhaps from a PC clone motherboard) or buy a commercial one and hack it's software? Will I need to modify the RF portions any?

3346. Re: AP Wire story on ham license fees

Date: 1989-10-18 00:41:12 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500239@ux1.cso.uiuc.edu>
Source record: 16230

Since the proposed fees involve more money than just the cost of processing
the actual paperwork, the following should be considered:

When change-of-address and upgrades are processed, the fee should be
PROPORTIONAL to the amount of extension of your license period that the
implied renewal gives you.

Suppose the basic fee is $35 and I've had my license for 3 years and then
I file a change-of-address. I should only have to pay $10.50 since I am
getting a 3 year extension of my license. This feature should apply to
all change-of-address and upgrade processing.

It's only $3.50 a year, that's less than a penny a day!!!!!
Let's stop whining over pennies and make sure the fee structure does not
unfairly overcharge those who have to move a lot, or can't make Extra
the first time at the VEC.

Other processing, such as STA's, waiver's, preferred callsign (NOW we can get
this service going again, AT THE FCC) should be the the things that have
bigger fees (I've heard they are talking about $105).

Why the hell is this for NJ readers ONLY ?????????

This is an issue for EVERYONE !!!!!!!!!!!
(at least for all hams with cars)

Remember that the state of New Jersey has FEDERAL highways running through it,
highways that YOUR TAX DOLLARS PAY FOR.

By all means write to Senator Newton E. Miller and express your concern
over a NJ law that allows NJ police to HARRASS EVERYONE, not just those
from New Jersey itself.

I've seen somewhere (in a magazine) an article on building the repeater from HT's, but it left out a couple of things. One was how to legally id the repeater transmission (assuming the repeater is in "automatic control", one of those legal "stickies"), and the other was how does the repeater control know FOR SURE when the receiver is receiving something. HT's do not have a "squelch is open" output connection that I know of.

Can anyone help .. ??
I am planning a business/pleasure trip with my XYL (who is also a HAM) to the San Francisco Bay area next week. I have a 440mhz handie-talkie and my wife has a 2meter handie. Is there a cross linked repeater in the SFO area where we could keep in touch via a 2meter/70cm linked repeater ???

Thanks for your help.

Source record: 16220

Hate to interrupt the slashing and burning with tech matters but...

SOme time ago I mentioned that I had bought the Circuit Specialties DDDF kit and was having problems with it. Well, never having gotten it to work right and deciding that soldering in tiny places wasn't my favorite hobby, I struck out anew.

Mark 1 was essentially a copy of the 73 magazine article. I found that the 555 timer is noisy as all get out (but you knew that, right?) and radiated a lot of hash through the ducks. Worse, there was so much noise inside the box that I never did get a good, reliable figure-8 pattern.

Mark II is a box based on the original QST article, though modified somewhat. ANtenna switching is done with PIN diodes across the antenna connectors and 1/4 wave lines from said connectors to a BNC T. The pulse generator is a 567 in its own shielded box, seperate from the antenna box. (Both are made from double sided PCB material). This works pretty well. I left out the frequency varying pot but left the level-adjust pot; even this doesn't seem too necessary.

Next step is to build a switching-type L/R indicator using a quad analog switch. The board is finished, the meter has been aquired (100-0-100ua) and all that's needed is a final test and a box to mount it in. I also plan to re-do ol' number 1, putting a 10-ohm resistor and some caps on the 555's supply line, internal sheilding in the box, and maybe going to the parallel PIN switching scheme.

But while this all seems to work, it still looks like doppler is the way to go. Once the current project stack is finished I'm thinking about building my own real doppler. The Dick Smith kit, if still available, has been built by a local ham. He was able to get a range of no more than 3 miles after extensive mods to cut the amount of switching noise. Anyone try building the circuit in the recent Tab DF-ing manual?

Interested fans of ducks and dopplers are invited to correspond or post their experiences.

RTTY DX NOTES FOR WEEKENDING 13TH OCTOBER 1989

BAND CONDITIONS SEEM TO HAVE BEEN VERY GOOD FOR THE PAST WEEK, WITH SOME
GOOD DX SHOWING UP FROM TIME TO TIME. WE HOPE THAT IT IS AN INDICATION OF
BETTER THINGS TO COME, AND WITH INFORMATION THAT THERE WILL BE SOME OF THE
RARER COUNTRIES ON THE BANDS IN THE NEXT WEEK OR SO, THINGS SHOULD GET A
LITTLE EXCITING.

OUR THANKS THIS WEEK GO TO TG9VT, W0LHS, W1DA, N2HOS, W2JGR, W6/G0AZT,
VE3JPC, OD5NG, I5FLN, G0ABI, JA1BLV AND VK2EG. THANKS CHAPS FOR YOUR HELP
WITH THE NOTES.

QSL INFORMATION.

SV0GB WILL QSL VIA DL3MCT.
SV9ABG WILL QSL VIA BOX 1333, IRAKLION, CRETE.
TU2BB QSLS VIA N2HOS.
CN8VE WILL RECEIVE HIS CARDS VIA VE6AHT.
P29KK SAYS TO QSL VIA VK4AH.
UH9ABM SAYS TO QSL VIA BOX 463, ASHKHABAD, 744001, USSR.
TR8AHO ADVISES THAT HIS QSL CARDS GO VIA DJ2VZ.
ZS6AED SAYS THAT HIS CBA IS CORRECT.
6W1FJ IS BELIEVED TO QSL VIA W3GH.

NOTES OF INTEREST.

WB3NDN WILL BE TAKING RTTY GEAR WITH HIM WHEN HE GOES TO A61 (UNITED ARAB EMIRATES) FROM THE 13TH TO 18TH OF OCTOBER. HE MAY BE THERE AS YOU READ THESE NOTES.

EA9WV IS TRYING TO OBTAIN PERMISSION TO OPERATE FROM SO (WESTERN SAHARA) IN MID-NOVEMBER.

TJ1MW REPORTS THAT HE WILL BE TRAVELING IN EUROPE FOR A MONTH, SO MIKE WILL BE QRT FOR A SPELL.

IT APPEARS THAT ZS8MI, WHILST OPERATING SSB, WILL GO TO RTTY UPON REQUEST ON HIS SSB FREQ. NOW THATS A CHANGE.
AA5AU AND W6/G0AZT WILL BE SIGNING C6A (BAHAMAS) FROM 25TH OCTOBER UNTIL 1ST NOVEMBER 1989. CW, SSB AND RTTY. QSL C6A/AA5AU TO HIS HOME CALL, AND C6A/G0AZT TO BOX 5194. RICHMOND, CA, 94805 USA.

THERE IS STILL SOME DOUBT ABOUT VQ9SS. ON LAST REPORTED INFORMATION HE WAS OPERATING FROM A SHIP IN THE HARBOR, NOT FROM A SHORE LOCATION. IF THAT IS CORRECT, IT WILL NOT COUNT FOR A VQ9 CONTACT.

RL8PYL IS STILL ORGANIZING HIS TRIP TO XU AND S2 FOR LATER THIS YEAR.

AND FINALLY, ZK1CQ STATES THAT HE WILL BE ON RTTY THIS WEEK FOR SURE. HE WILL THEN GO TO SOUTH COOKS AROUND 21ST OCTOBER FOR A FEW DAYS, THEN BACK TO ZL1AMO. RON WILL THEN GET TO WORK ON THE QSL CARDS.

GL DE DX1.

I saw no mention of BULL buying HEATH in any of the news relating to
this transaction. Quite the contrary the deal is supposed to be ZENITH
selling off it's computer business in order to concentrate on the consumer
electronics market. I think if you look closely at a catalog you will
find much more consumer devices than computers. I am much more curious
as to what will happen to all the very large government contracts that
Zenith had to sell computers. Lets see, USMA (~1500/yr), USNA (~4000/yr),
USAFA (~4000/yr) and that is just the students!!
Should prove rather interesting to watch considering the already staggering
balance of payments problems we have.

>John Moore (NJ7E) mcdphx!anasaz!john asuvax!anasaz!john

That's not really true either. You saved the sponser the cost of hiring
a commercial communications provider. Or even just leasing commercial
radios and hiring operators to man them. I'll bet he didn't put the money
he saved into his favorite charity either. ;-)
(UP ON MY SOAPBOX)
I have long thought that hams need to be more careful about who and what
events we provide communications for. Events that were intended to provide
enjoyment/entertainment for the public in the past have changed over the
last few years. Most of the marathons that are held anymore only tolerate
the weekend runner today. They are PROFESSIONAL events with large prizes
and corporate backers and even larger budgets. MHT doesn't sponser The NY
Marathon out of the goodness of it's heart. They do it strictly for the
national TV coverage and advertising it offers.
In this time of frequency raiders, I think we need to re-assess who we are
providing service for before the time arrives when a commercial communications
provider goes to the FCC with a claim of unfair restraint of trade because

we took business away from him.
The days when hams were the only ones who knew about radio are gone.
Anybody can do it now.

(soapbox collapses under my tonnage) :-)

Just something IMHO we need to think about.

Source record: 16223
Cross-posted to: sci.electronics,rec.ham-radio

to sci.electronics and rec.ham-radio:

Sky & Telescope October '89 published plans for a "Jam-jar magnetometer" useful as an aurora alarm. A more advanced version of the same device appeared in the July 1988 issue of _The Lowdown_ (newsletter of the Longwave Club of America). This one has a Hall-effect sensor and amplifiers added, so that the compass deflections can be output to a chart-recorder.

See also _Electronics_ magazine, December 1980, p. 112 for plans of a Hall-effect magnetic compass with no moving parts.

Copies of the above available for SASE, and I'm sending them to WA4VLV re his request on rec.ham-radio.

3357. Re: Building A (Very) Low Cost Repeater

Newsgroup: rec.ham-radio
Date: 1989-10-18 17:25:25 UTC
From: music@hpfcmgw.HP.COM
Message-ID: <1690041@hpfcmgw.HP.COM>
Source record: 16224

/ hpfcmgw:rec.ham-radio / noel@ubbs-nh.MV.COM (N. Del More) / 11:20 pm Oct 15, 1989 /
I have it in mind to build a (very) low cost repeater for use here as
well as for use as an "emergency" repeater.

The idea that I have is to use two handhelds, probably two late model
synthesized rigs.

Noel
N2AXI

I have tried this routine once using 2 ICOM IC22S (good rigs in their own
right) and some home brew stuff to do a timer and IDer function and also
a duplexer of sufficient quality. All of the radio and timer stuff was in a
silver plated box to provide RF isolation, everything isolated and feed thru
capacitors on the audio and power lines.... Oh it was a beauty of a job.

-BUT-

It didn't work. 'Why?' you might well ask.... Well, it is unfortunate, but
the PLL circuitry will kick up enough sideband hash that a little tiny bit
of the transmitter will feed into the receiver and cause some amount of de-
sensing and in some cases, feedback conditions.

I think that the best thing to do for a cheepie repeater is to be able to
have the two 2m units seperated by 1/4th mile and linked on 450.

The logistics are more complex but unless you are willing to go with clean
commercial gear and top notch hardware, the idea may not be that practicle.

John Wells WA0LHB in Ft. Fun, Coloradio

3358. FAA emergency frequencies?

Newsgroup: rec.ham-radio
Date: 1989-10-18 17:35:00 UTC
From: Ed@ALDERAAN.SCRC.SYMBOLICS.COM
Message-ID: <19891018173520.0.ED@PEREGRINE.SCRC.Symbolics.COM>
Source record: 16225

The FAA office in Burlington, MA has just erected a large antenna on their roof, which has piqued the curiosity of the pilots and hams who work here at SCRC, across the parking lot from said antenna. The information office referred me to the operations center, which explained that the antenna was for HF SSB emergency communications with other FAA facilities but declined to provide details like frequencies.

The antenna looks roughly like this:

```
| ; | Center tower is about 24' tall
\======|======/ ; \ / Six "umbrella ribs"
.\====|====/. ; === Lots of wires (1 every foot or so) wrapped around ribs.
. \==|==/ . ; . . Lots of wires (guys or elements? I don't know) running
. . \|/ . . ; from ribs to roof
. . .|. . .
... | ...
. | .
roofroofroofroof
```

I've never seen an antenna like this before; does anybody recognize the design? Does anybody have any idea what frequencies the FAA might be using for this system?

3359. All India Radio Audible in E. NoAm.

Newsgroup: rec.ham-radio
Date: 1989-10-18 17:39:00 UTC
From: benk@inmet
Message-ID: <13700008@inmet>
Source record: 16226

A while back, I recall reading a note posted by someone who wanted
to know if/how they could receive broadcasts from All India Radio in the
eastern part of North America. The poster had apparently tried many times
to recieve this station with no success.

Now that Autumn is upon us (in the Northern Hemisphere), a path of
total (or near) darkness exists between India and the eastern part of North
America during several hours during the local late afternoon. At this time
it is possible to hear the General Overseas Service (in English) of All India
Radio on a couple of frequencies in the 25, 31, (and if you are lucky 41) meter
SW broadcast bands.

The two best frequencies at my QTH (Boston) have been 11620 and 9910 kHz.
The "opening" starts at about 2100 UTC (it gets earlier as the sun sets earlier
and earlier), and lasts until 2230-2245 or so, when 11620 closes down. Last
year, 11620 and 9910 were about equally good; so far this year 11620 is better:
9910 has suffered from a lot of QRM, possibly sideband splatter from the badly
mis-modulated signal of Radio Cairo's European service on 9900.

Good luck and good listening!

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Howard's new maxtor drive decided to commit silicon suicide about a month or
so ago. He had to send the drive out for service and you know what that
means. He assured me that he would have it up this weekend but I doubt it
He told me that his video card is causing some problems as well. I run the
same stuff here albiet I do not get the useage he does.

3364. Re: Field Day... OK... A proposal:

Newsgroup: rec.ham-radio
Date: 1989-10-19 00:03:38 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880084@hpfcdc.HP.COM>
Source record: 16238

I've only participated in one field day. As an outsider, it seemed
strange that field day was:

o done in the summer. (no emergencies happen in the winter, right ?)
o the exact start and stop time are known. (planned emergencies ?)
o you get points for putting out marginal signal (sorry QRPers) that
hardly anyone can hear.
o the antenna systems and radios are usually commercially-made.
(real hams roll their own stuff, right ?)
o home stations are frowned upon. (In a real emergency, we all run to
the nearest mountaintop, where the emergency isn't ?)
o more social event than communications (we hams do like to yak...)

I figure if you can crank up a gasoline generator and run a KW into a
homebrew wire yagi, more power (pun intended) to you ! The field day
that I saw was more gamesmanship than emergency preparedness. It
doesn't take much to drive onto a mountaintop, set up a tower section
with a rotatable tribander, fire up the generator (and linear), sit down
in the warm Winnebago with a cold can of Coke, and start logging
California contacts on the PC. I have more of a challenge at home with
my barefoot TS520 and HF6VX vertical.

Sorry if this sounds too negative. Maybe field day is serving two
purposes - on the one hand it gets everyone out of the house for a nice
camping trip, while on the other hand it "demonstrates" emergency
preparedness.

What behavior do we want to reward here ? I think emergency preparedness
means:
not using commercial power
transmitting from the site of the emergency
contacting most of the major metropolitan areas of North America
with simulated traffic. (e.g. "Jimmy Carter is alive
and well in Plains, Ga, end message." Not this twinkie
"2A CO" no-op stuff.)
Cooperation - passing traffic for someone that can't make it to
a destination on their own. Most of emergency handling
is cooperation, even if it's only staying off the
frequency when someone else is handling traffic.
Cooperative contesting - what a concept !
No restrictions on mode (HF packet, anyone ?) or power (<1500)
I would like to say "no point systems", but we need a way
measure our performance relative to others, just to know
how ready we really are.
More credit for using non-commercial gear. Let's be realistic.

Most hurricanes tend to topple towers and 6-element
tribanders.

3365. Re: PL259 connector assembly

Newsgroup: rec.ham-radio
Date: 1989-10-19 00:15:23 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880085@hpfcdc.HP.COM>
Source record: 16239

This is how I do it:

1. Put the UG connector on first
2. strip 1" of outer PVC jacket
3. comb braid over UG connector
4. Cut off enough braid so it doesn't contact the threads on the UG
5. leave about 1/4" of foam inner dielectric (I use the PL259 inside
to judge the amount of clearance.)
6. Screw on the PL259. You should see the outer copper braid through
the four little holes on the side of the PL259, and the center
conductor should protrude out the end of the PL259.
7. Cut center conductor flush with PL259, solder.
8. Make sure UG and PL are screwed tightly.
9. Solder through the four little holes on the side.
10. Test Continuity of center conductors and shields. Check for shorts
between center and shield.

I've never had a plug come off or go intermittent on me using this
method. (My test is to clamp an SO-239 in a vice, screw in the PL259,
and yank on the cable. If I can play tug-of-war without it coming out,
it's a permanent job.) On the other hand, you can never reuse the PL259
after you solder those four little holes on the side. This method also
ensures a few less places for water to enter the coax - you only have to
seal the UG/PL junction and the PL/coax junction.

That is certainly a major cause. But from a regulatory point of view, it
is fixed at 3 months (which does exactly coorespond to the seasons by
frequency, though maybe not in phase). Even if a station believed that
a certain frequency was fine for them in all four seasons, they still
have to request it every quarter. Allocations are broken down by hours
as well as frequency.

I would assume the FBI would want to keep these frequencies as secret as possible for the safety of their agents and other persons wearing the body mikes. It would seem to me, though, that it is very easy to detect if a person is wearing one of these using equipment that even hams can afford (as well as drug dealers). Perhaps spread spectrum needs to be used (or is in use).

From: phil@ux1.cso.uiuc.edu
Message-ID: <30500247@ux1.cso.uiuc.edu>
Source record: 16249

One of the problems in a situation like this is that the long distance phone lines of all the carriers become totally clogged with telephone calls. News reports I've heard indicate at least one company has controlled their call routing so that no calls except placed by an operator will go through so that the phone lines remain open for the important calls.

Because phone service IN THE AFFECTED AREA is spotty, it is more prudent to allow those who do have working phone service to call OUT to inform friends and relatives that they are ok, than it is to allow outsiders to call IN to find out, when a large portion of these calls will be wasted to dead service areas.

Ham radio traffic can be of great value to the general public by forwarding messages of this ("we are all ok") type. Even so, outbound messages should have higher priority than inbound ones.

I personally would like to hear about what INTRA Bay Area ham radio activity is taking place. I suspect that we will hear about this, but not immediately.

Message-ID: <30500248@ux1.cso.uiuc.edu>
Source record: 16247

I would like to find out if anyone has obtained mods info for the following radios:

Icom IC-3210
Icom IC-2400
Kenwood TM-731

to expand their UHF coverage. According to technicians at the respective company offices, full 420-450 Mhz coverage is possible, but because the mod also opens up public service band coverage, they cannot (company policy) give out information on the mods unless you have a MARS or CAP license.

3370. Japan bashing???? maybe, but....

Newsgroup: rec.ham-radio
Date: 1989-10-19 00:40:59 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500249@ux1.cso.uiuc.edu>
Source record: 16250

I spoke with some people at 2 of the big 3 Japanese ham radio companies that sell in the US, today. I talked to them about their policy of not giving out the information to make their radios work 420-440 Mhz. They will give out the info if you have a MARS or CAP license, but who needs those licenses to work 420-440 Mhz? With VHF radios, their policy makes sense since the radios already cover 144-148 Mhz, but with UHF radios it no longer does.

What VHF frequencies does MARS use, by the way?

The problem is of course the way the radios are designed to work. The micro processor inside them reads a matrix of diodes that tells it what features the radio is supposed to have, such as the range of frequencies. However there is no way to set up the diodes to enable 420-440 Mhz without ALSO enabling 450-470 Mhz or more. The dealers and manufacturers are also getting pressure from the FCC not to sell these radios into the public service market since they are not type accepted for that market.

The micro processor therefore must at least know about the various band ranges that it will need to enable (or not enable). The problem seems to be that it does not know about 420-430 as a separate range, and perhaps the 430-440 range (used in Japan and Europe) is mutually exclusive with 440-450 (i.e. one diode in means change from 430-440 to 440-450).

I tried to suggest to the people I talked to at the manufacturers that they ask the engineering design people to make the next versions of the processor software so that it knows of the band ranges 420-450 and 430-450 (for above line A and Canada) so that either they can give out that limited mod info more readily, or better yet, make the units sold in America already have the full appropriate range.

The response I got from the people I talked to was that the radios are made in Japan (I already knew that) and that there is nothing they can do. I asked more questions and found out that no one in the United States is EVER consulted regarding the design of a radio.

Now it would not be very hard at all to make the very small little software changes that are needed to make a radio that can still be a fully international model and can still be configured on the production line to work on 420-450 Mhz or 430-450 Mhz. The people on this side of the big pond don't seem to want to make any effort to get this done or even considered by the design people.

There are some other problems with radios made in Japan. For instance Kenwood has made several models recently that have LCD displays and they claim that LCD works fine in Japan. So if this is the case, then they didn't consider other markets when they designed the radios. We also often hear about the audio quality being set up for Japanese language speech and left that way

even for American models. Yet another example is the 23cm radios that use a 20 khz channel step instead of the 25 khz standard band plan the ARRL has established (which is used by at least half of the 23cm repeaters). 25 khz is certainly possible since the European version does have it.

What we see here is a worse example of the case of manufacturers not listening to what the consumers want (en masse in this case) as well as the American manufacturer reps adding further resistance to any effort to suggest product improvement.

I plan to continue and repeat my efforts to get these companies to respond. While I will probably still make some phone calls, letters do seem to be in order. Does anyone have the JAPANESE addresses to mail to for these companies?

I'd also like to suggest that anyone that is not 100% satified with their rice box radios, to PLEASE write a letter to the manufacturer(s) (including the Japanese offices if the addresses can be found) explaining what is wrong with the radio design, and what you think they can and should do to make the next model much better.

Is this more "Japanese bashing"? Maybe, but more likely it is a case of bashing some sense into someone.

3372. Guemes Island followup

Newsgroup: rec.ham-radio
Date: 1989-10-19 03:12:00 UTC
From: tad@ssc.UUCP
Message-ID: <238@ssc.UUCP>
Source record: 16254

SB DXERS @ ALLUSA $KT7H101A
Guemes Is. Re-cap, pt 1

Guemes Island DXpedition

I wanted to post a follow-up to my notices about the petition for new country status for Guemes and Tatoosh Islands, and let everyone know how well the DXpedition to Guemes went, and the chances of new country status being granted.

When I looked at Rule 3b in the DXCC rules and saw that it seemed to apply to the San Juan Archipelago, I was skeptical. I had studied DXCC rules, and I just couldn't believe that there was a rule so clear that there was no doubt about it's application. Many DXCC rules are not as easy to understand. I showed it to several friends, looked at maps, and re-read the rules, and no matter how I tried to draw lines between Guemes and Tatoosh Islands, they always crossed the intervening territory of British Columbia. I decided to put it on the air, apply for new country status, and see what happened.

For those not familiar with DXCC rule 3b, here it is:

"(b) Islands: Where two islands, of the government under Point 1, are totally separated by an intervening DXCC country (also under Point 1), each island counts as a separate DXCC country. No minimum distance is required. The test for total separation means that a straight line may not be drawn from any point on one island to any point on the other island without passing through another DXCC country. This intervening country may be a part of either island, another island, or part of a continent."

Tatoosh and Guemes Islands qualify under rule 3b because British Columbia (VE7) intervenes. There is just no way to draw a line between Tatoosh and Guemes without crossing VE7, unless the ARRL is planning to re-define a straight line!

I contacted a ham who lives on Guemes Island, and he offered to let me use his station for the operation on Labor Day weekend. I went up to Guemes, put it on the air, and made almost 3,000 QSOs. Several hams came over to the island to help out with the pileups. If you worked us and have not QSLd yet, please send your card with an SASE to the address below. If you did not work us, but would like a nice map showing Tatoosh, Guemes, and the line crossing British Columbia, drop me a note with an SASE, and I'll send you one.

Two days before the operation I began getting calls at work from members of the ARRL DX Advisory Committee. One of them contacted my mother via an old callbook address, and got my work number. These guys tried everything to

persuade me NOT to put Guemes Island on the air. One of them even told me that he was "deeply offended" by my application for new country status!

They said that Rule 3b was flawed, and that they were working on a rewrite. I mentioned that at this point it had been 20 months since the ARRL Board had approved this rule, and this was plenty of time to make corrections.

Continued in Part 2.
/EX
SB DXERS @ ALLUSA $KT7H101B
Guemes Is. Re-cap, pt 2

Continued from Part 1.

We talked about some other entities that had been granted country status in the past that these fellows felt should not be counted as separate countries. One was the Sovereign Military Order of Malta, a building inside the Vatican. They said that rules had changed so that something like this couldn't be approved again, but that this country was "grandfathered" when the rules changed. I told them I hoped that if they rewrote Rule 3b to specifically exclude Guemes Island, that it could also be grandfathered, since it obviously does qualify at this time.

Their basic objection was that they felt that it was not DX. It was just too close to the United States! I feel that this reveals an interesting bias. It seems that in order for it to be DX, it has to be "over there" somewhere. Probably if it was in the Red Sea or Africa they would treat this application seriously. Never mind that hams in Asia or Europe might consider Guemes Island as DX. It is just not exotic enough for U.S. hams.

I have received some other interesting objections to Guemes being counted as a separate DXCC country. One is that it does not issue it's own currency! But there are many DXCC countries that don't (Aruba, Palmyra; the list is endless) and besides, it is not a requirement of rule 3b.

If you look at the DXCC countries list and the rules, you can find many countries that do not qualify under the current rules regarding government, or any other rules. But the reason that they count is that at the time that separate country status was applied for, they did qualify, and when the rule was changed, they were grandfathered. Check out any of the Soviet Republics, Desecheo, Wales, Isle of Man, even Alaska and Hawaii! If the ARRL finally changes rule 3b, why shouldn't Guemes Island be grandfathered too?

The DXAC has not made a recommendation yet on Guemes Island. My hope for acceptance is buoyed by a statement in the DX column in the October 1989 issue of CQ magazine. Don Search, W3AZD, DXCC administrator said:

"The Board of Directors has told us to enforce the rules as written. There are no provisions in the DXCC rules for exceptions."

After reading rule 3b, looking at a map, and reading the statement from the DXCC administrator, how can our claim be denied?

Remember that DXAC will recommend, but not decide the status of Guemes Island. If you read rule 3b, look at the map and agree that it qualifies, contact your ARRL Division Director. Also please contact ARRL Executive V.P. Dave Sumner, K1ZZ, at ARRL, 225 Main St., Newington, CT 06111.

In closing, I did not do this to make fun of DXCC, the ARRL, or to cause anyone any big problems. I have always wanted to put a "new one" on the air, and I did it. DXers love to chase a new country, and everyone had a great time. I hope you were able to work us, and now have our unique QSL in your shack.

73 and Good DX!

>AT A LOCAL HAMFEST I LOOKED AT A DICK SMITH DIRECTION FINDING UNIT THAT
>WAS PURCHASED AS A KIT. IT LOOKED LIKE QUITE A NICE PACKAGE.

The Dick Smith unit works, but is much inferior to the Doppler Systems unit, mostly because of the way the audio is handled. In any event, to use the system you will have to have a radio capable of receiving the aircraft band in *FM* mode. This is because both units work by inducing an FM "doppler" shift from an electrically "rotated" antenna array.

>DOES ANYONE HAVE ANY SUGGESTIONS FOR SOMEONE THAT IS NOT VERY TECHNICALLY
>INCLINED FOR AN EFFECTIVE DF DEVICE SUITABLE FOR INSTALLATION IN A VEHICLE
>AND USED FOR AIR PATROL PURPOSES.

A group called the "Happy Flyers" had a kit for an AM DF unit, similar to the Little Elper, but using the aircraft's own radio receiver for audio. The last address I have for them is:
Hart Postlethwaite, WB6CQW (International Commander)
1811 Hillman Ave.
Belmont, CA 94002 (415) 341-4000

This address is 10 years old, so use it with care.

I don't see why the FBI bothered to object: since the LoJack frequencies are fixed and publicly available, they are no longer secret; and since they are already in widespread use in some states, the FBI will have to modify or dump their equipment. It's too late to voice their objections now, and even if they had objected several years ago, that would still publicize the frequencies they use.

:17 Meredith Drive | noel@ubbs-nh.mv.com
:Nashua, New Hampshire 03063 | It's unix me son! `taint spozed tah make cents

I've heard of someone doing something like this with 2 Icom IC-02AT's before.
They used two VOX units to hook them together. With a steroe mini to stereo
mini cord (modified to swap tip and sleeve) they hooked the VOX units
together. Each radio was set to their approproate frequencies. When one
hh recieved signal, its earphone fed into the mic of the other's VOX unit
which transmitted automatically. The same applied in the other direction.
I've not tried this yet, but it seems feasable. I believe the earphone
gain would need to be set fairly low though.

BTW- I've still not heard from anyone on all the mods possible on the
ICOM IC-02AT yet. I can't FTP so I need mail. Could someone please
send mods (looking for frequency mods). Please?

Hope the VOX approach works if you try it.

Source record: 16256

I just received literature for the SuperDF direction finder.
I first read about this product in the "Transmitter Hunting" book
then in "Mobile Radio Technology" magazine.

Has anyone on the net tried the SuperDF? If so, please comment
on your experiences and you opinion of the quality of construction,
performance, etc.

The SuperDF connects to the earphone and antenna jacks
of any FM receiver. Both the control unit and antennas are
available in kit or assembled form.

The SuperDF is available from:

BMG Engineering
9935 East Garibaldi Avenue
Temple City, CA 91780

Dicsclaimer: This is not a product endorsement.

Everyone needs this technology. On National Public Radio last week
there was a story about baby monitors. These are wireless devices
that parents use to listen in on their baby's room. The devices work
like a sensitive one-way walkie-talkie. The problem: Anyone with a
radio scanner can hear just about every conversation in your house.
There is a similar problem with cordless phone. Cellular phone
can be heard on older scanners.

Any solution that tries to outlaw such monitoring (although it
is illegal to monitor cellular phone calls) is doomed to failure.
[You just can't stop people from listening to radio signals that
enter their house.] The technological solution to this
technological problem is much better -- scramble the signals.
There is precedence: HBO solved (most of) its problem with home satellite
dish owners by scrambling.

Well they went and done it. Icom just announced the DUAL BAND version of
their new 'SAT series ultra small HT's. It's called the IC-24 SAT.
The package is not much (if any) larger than the single band SAT series.
Chech with your local Icom dealer for details.

Icom also announced the IC 1275 1200MHz base station, and 2 new repeaters
1 for 2 Meters and the other for 1200 MHz.

You heard it here first.

Get a copy of Model Railroader magazine at the local newsstand and look for an ad from an outfit called Little Engines (in CA, I believe). They have kits and castings for scale locomotives and stationary engines. You could probably even compute available horsepower from the scaling factor. Actually, the efficiencies of these little engines is probably better than the originals.

<On National Public Radio last week there was a story about baby monitors...
The problem: Anyone with a radio scanner can hear just about every conversation

Monitoring these is real interesting late at night, especially since so many
babies sleep in their parent's rooms! (Of course, this is what I've been told.
Being a mature adult, I have no need for such titilation. :-)

Seriously, it's going to be tough to get manufacturers to add any cost at all
in this price sensitive market. I suspect encryption would double the price of
a baby monitor. The only hope I see is if a company *concentrates* on secure
baby monitors, since in order to sell them at the higher price, they will have
to explain why they are better than cheaper ones, which is an issue I imagine
the baby-monitor industry would just as soon ignore.

The one that really upsets me is that the CMT lobby got EPCA pushed through
congress to save a lousy $10 - $20 on a kilobuck device!

Well, Tad, it was a good hack, but I for one don't think it's a "new one" either.

What we see is an example of badly written rules. Laws aren't usually written by amateurs (legislators have staff assistants) and rules, like laws, have both a "spirit" and a "letter". Poorly drafted rules like DXCC rule 3b are prone to sloppy interpretation, but clearly the "spirit" of the rule was not to make Guemes a country.

Come to think of it, can you draw a line from Galveston Island, TX to some little island in Southern CA that doesn't cross northern Mexico? Campobello, ME to Mercer Is, WA without crossing Ontario?

Tad did a good job of proving that the DXCC rules are sloppily written. IMHO, not much more.

+
No offense, OM, but most of us in 6 land _DO USE_ the 53MHz freqs for R/C because of the simple fact that the QRP nature of R/C transmitters tends to not disturb VHF Television Channel 2. Now I know that in NEWINGTON, CONN this is of no great concern, since they don't use TV Ch 2, but here it's a matter of survival! The ARRL 6 meter band plan is badly out of tune...look at the band plans that SMIRK (HQ for which is in 5 land, I believe..) or the Southern California Six Meter Club have offered. They put the LOW POWER device operation at the top of the band, and repeaters a bit lower; for this very reason. 50.5 - 51 is used for simplex around here.

3386. Phone Patches and Them Jammers

Newsgroup: rec.ham-radio
Date: 1989-10-19 21:08:06 UTC
From: dtheriau@wellfleet.com
Message-ID: <8910192108.AA04152@dt.Wellfleet.Com>
Source record: 16276

I have listened to many disaster communications over HAM radio in the last few years. I have been ashamed to be called a HAM after listening to these "Sick Individuals" who seem to love jamming Emergency Nets.

This problem seems to be getting worse and worse. The Hugo disaster brought out a few sick one's. One night listening to 4U1UN and three stations (St. Croix, St. Thomas, San Juan) attempting to get information passed to the athorities on Looting and a prison break, ONE individual just constantly harrassed all 4 stations. There were bigotry statements which were said which not only did not belong on HAM radio but did not belong in the USA. This guy was so bad that the stations had to work out of band on a secret frequency just to get traffic passed.

As we all know it only takes a few rotten apples to ruin the barrel. Hams have been granted slices of a very nice communications spectrum, which can be taken back by our government quite easily. It's hard for us to justify our spectrum needs when we have incidents such as the jamming on HF/VHF bands; especially during Emergencies.

Many of the Emergency Nets followed the priority of outgoing traffic instead of incomming. But it was interesting how many HAMs receivers were not working; Nets would say over and over that they were not taking health and welfare traffic but stations would still attempt to break in. LISTEN before TRANSMITTING.

Any Idea's on How to Stop this type of activity? Do Hams ever get PINK slips anymore? Are these people HAMS or Illegals? Are any of them ever caught? I've heard the NSA/FCC monitoring stations are quite efficient at locating transmissions. Can we hire them to help police HAM bands?

Thanks for listening to my soapbox.

3391. Magnetometers and magnetic storms

Newsgroup: rec.ham-radio
Date: 1989-10-20 02:03:39 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <8910200203.AA10601@cmr.ncsl.nist.gov>
Source record: 16270

Well, actually the subject is detecting magnetic disturbances.

Decades ago W3GKP used a VERY simple means of detecting disturbances such as magnetic storms - as an aid to his 2-meter aurora prediction interest - to wit:

Using a high-input-impedance voltmeter, find the grounded side of your telephone line. Now continue to measure or record this "zero" voltage relative to a good (water-pipe) ground at your location. When there is a disturbance from a magnetic storm your will see a voltage. He saw as much as a volt for big storms. When your phone rings, you may see a HUNDRED volts, so your meter has to be able to handle that kind of overload.

The idea is that you are measuring the voltage induced in a loop of wire from your house back to the phone company office (with a return through the earth itself), induced that is by changes in the Earth's field.

```
-------------------------------------
| |
meter < - - a few kilometers - - > | phone co. office
| |
gnd gnd
```

Your meter will have to have perhaps a megohm input impedance to avoid upsetting the phone company (if I remember what Smitty said).

BTW, Smitty was one end of the first ham EME contact (with W4AO) on two meters. Sadly they are both now Silent Keys.

73, Bob W3OTC

Well, immediately after the quake struck, I went around the whole house to check for structural damage, turned off the gas, and then checked into the San Mateo County RACES emergency net on the WA6TOW repeater. The net handled a variety of reports from all over the Bay Area, such as road conditions, damage reports (from downed power lines to ruptured high-pressure water mains and buckled roads), and the like. Then it moved on to coordinating some Search & Rescue (search dogs and the like), emergency generators and Red Cross-type traffic. The net ran on into the night; I couldn't tell you when it shut down, because I had other things to worry about (like a father stuck on a train who-knows-where).

Overall, the net operated in a very orderly fashion, with not much of the 'idiot-traffic' one might expect.

One thing that surprised me was that the repeater never got knocked off the air; others in the area were either knocked off completely, or were in a very restricted mode.

ROSE SYMPOSIUM SCHEDULED FOR VETERANS' DAY

The Radio Amateur Telecommunications Society (RATS) and the New Jersey Institute of Technology Amateur Radio Club (NJITARC) are co-sponsoring the first RATS Open System Environment Symposium (ROSES-1) on November 11 from 8 AM until 6 PM at the Hazell Center on the NJIT campus in Newark. Admission and parking are free for all attending. Talk-in will be on 145.19 MHz. ROSES-1 will be a packet-radio forum for new users, PBBS SYSOPs and network gurus, which will focus on OSI-based or "Open" systems. There will be technical talks and round table discussions on packet-radio operation, software and hardware developments, as well as license exams (provided by the Bergen Amateur Radio Association from 8 AM until 11 AM), equipment demonstrations, a TNC tune-up clinic (bring your radio and TNC), and network planning sessions for switches and PBBSs.

For testing information, contact Pete Adely, K2MHP, at 201-796-6622. For more information including speaker requests, contact

Gordon Beattie, N2DSY, Telephone 201-387-8896
or via electronic mail at
n2dsy@kd6th (packet radio),
n2dsy@kd6th.nj.usa.hamradio.org.iso (iso/packet radio)
n2dsy@hou2d.att.com (internet) or
72417,652 (CompuServe EasyPlex).

NEW ADDRESS FOR TEXAS PACKET RADIO SOCIETY

The Texas Packet Radio Society has a new address. If you have had a letter to TPRS returned recently, please mail it again to:

Texas Packet Radio Society, Inc.
PO Box 50238
Denton, TX 76206-0238

from Greg Jones, WD5IVD

BY4WNG GETTING ON PACKET RADIO

A recent letter from BZ4RDX states that the club station at the University of Nanjing (BY4WNG) has been on RTTY and now wants to get on packet radio.

They are interested in receiving written material on packet radio. If you have any to spare, why not put it to good use over there and mail it to:

Ni, BZ4RDX
Box 1827
Nanjing 210018
Peoples Republic of China

PIGEON-HOLING BULLETINS

With the steady increase of messages arriving at our PBBSs, users have no way to effectively search the messages for specific items of interest without downloading the entire list and manually searching the Subject fields. This is an incredible waste of valuable air time on intensely congested networks.

Sending a bulletin (SB) to ALL is redundant. Bulletins are intended for anyone to read, so why address all types of bulletins to ALL? By utilizing the TO field to separate bulletins into a few specific categories, we can pigeon-hole 90% of all the bulletins being sent. Although each regional area may add a few more categories, let's try to keep this as simple and uniform as possible so users will get used to the categories.

Here is a proposed list:

TO: Topic
4SALE Items for sale or trade
WANTED Things wanted.
HELP Requests for information, help, questions, etc.
MODS Requests or information concerning equipment modifications
CLASS Ham (or other) license class announcements
EXAMS Ham (or other) examination announcements
CLUB Club events, meetings, announcements
HAMFST Hamfest or flea market announcements
MAP Maps
MAPKEY Keys to maps
NETWRK Announcements about the packet-radio network
LIST Lists (PBBSs, available material, frequencies, repeaters, etc)
INFO Information about anything (servers, help files)
ALL Anything not covered above.

In addition, some suggestions for topics not generally sent by users:
SAT All satellite related material
PROP Propagation reports
DX DX reports
QST ARRL/CRRL bulletins not covered above

Specific equipment could also be addressed:
MFJ MFJ products
AEA AEA products
KAM Kantronics products
PACCOM PacComm products
C64 Commodore C-64 computers

AMIGA Amiga computers
PC IBM PC, clones and compatibles computers
MAC Apple Macintosh computers

The only way this will work is if users use these categories when sending bulletins. Your local SYSOP does not have the time to edit your messages. Please specify a category and help reduce the clutter on the airwaves.

Most users cannot check in to their local PBBS every day to examine the message list. If they check in once per week, they may have 50 or more messages to sort through. The network cannot take it, users cannot take it and SYSOPs cannot take it. Let's fix this problem before it is totally out of control.

from Mark Marston, KA1NNN @ KA1NNN

DISTRIBUTION AND HIERARCHICAL ROUTING NAMES SOUGHT

Gordon Beattie, N2DSY, is collecting information for an Amateur Radio directory service. The items he is looking for are outlined below, but in short, please send him the distribution group names and the hierarchical routing names that are used in your area.

The results will be posted in all the usual places with the intention of reducing conflicts and helping the packet-radio community evaluate what enhancements are needed to handle future growth. It will also provide a few references for folks wishing to add new names to the list.

Distribution Group Names

Please send the distribution list of names used in your area to distribute bulletins, group messages, etc. Examples of these include: "all@allbbs," "rats," "all@nynet." This includes private lists such as "ratsmbr" (rats members). In the case of distribution group names, please include the current distribution and any limitations on who may use this list when addressing a message.

Hierarchical Routing

Please send the hierarchical routing entries used in the rfc822-like domain strings found in messages. These usually include a "#" at some point in the string.

What to Send

Please send the following information with the entry:
1. Entry,
2. Region or group using the entry,
3. Responsible individual/club/net (include contact information, if known),
4. Systems supporting it (if known),
5. An example of how this is used (command lines and sample messages in and out of the system performing distribution would be helpful),
6. The format of the BID associated with the distribution name, for example, is there a special character sequence used with the messages or

is the number sequential or a date, etc.,
7. Message type(s) used in conjunction with the group name, hierarchical routing designator, etc. (for example, "traffic," "bulletin," "private,"),
8. Any notes which would improve understanding of the above.

Send your replies to any of the following:

n2dsy@kd6th (packet radio),
n2dsy@kd6th.nj.usa.hamradio.org.iso (iso/packet radio)
n2dsy@hou2d.att.com (internet)
72417,652 (CompuServe EasyPlex)

If you have any questions or comments send them to N2DSY via any of the electronic mail addresses listed above or telephone him at 201-615-4168 (office) or 201-387-8896 (home).

Has anybody added PL to an ICOM 290H? I have a Communication Specialists encoding board, which I would like to add to the 290.

I have a good spot to inject the PL (just before the FM modulator), but it requires a small amount of circuit board modification. I have not found a switched source of 12 V, but I suspect there may be pins where 8V is switched on transmit.

If anybody has already done this, I would appreciate seeing your solution. Thanks.

3397. Re: cellular phone antennas (antenii??)

Newsgroup: rec.ham-radio
Date: 1989-10-20 13:42:33 UTC
From: ghg@ucbvax.BERKELEY.EDU
Message-ID: <32029@ucbvax.BERKELEY.EDU>
Source record: 16129

In article <8910171952.AA07349@NADC.ARPA>, rachiele@NADC.ARPA (J. Rachiele) writes:
>
> Everyone is posting that putting a higher gain antenna on your cellular phone
> will have no effect, since the controller at the cell will automatically lower
> your power to the point where you are using the minimum power necessary to
> complete the connection reliably.

In practice, it seems that the cell site throttling back power is
only used "close in" (1-2 mi from cell site). Experience has
shown this to be the case and it was confirmed by GTE Mobilnet
engineers. It is mostly to eliminate intermod problems at the cell site.
I own a Motorola "F" series portable, and running that in "maint mode",
have displayed the power level, channel, received signal strength, etc.

The throttle back does happen only in the first couple of miles
from the cell site (for a portable at least). The radio is capable
of 8 power levels, 0 - 7, in practice only levels 2-7 seem to be used,
with levels 0 and 1 being set to Hex "FF" (wide open). Power level 2
is the "advertised" 800MW. The other steps (from memory, so only
approx) for 3-7 are ~400MW, 240MW, 120MW, 60MW, 30MW. Receiver quality
has much more impact than xmit power. One can program power level
2 to be "FF", and you get about 1.5W or so out. Only in very marginal
areas (hilltop @ 35Mi from a cellsite) does running 1.5W even
make a differance. Final (and the whole case) heats up, bat drains
quickly, etc.

Motorola front ends (receivers) leave the others in the dust.
This shows up in marginal areas (in buildings, etc), and on cellular
test equipment, good signal even at -116 dbm. You can also drop Motorola
radios (I have done so), 6 ft or more onto concrete, and they work like
the day they were new. Better receivers, both in the mobile/portable
and the cellsite make much more differance than xmit power changes of 3db.
GTE Mobilnet uses Motorola Cellsites.

I once ran 2400 Baud MNP data from out of a valley (not line of sight)
with full foliage (which attenuates signals) at a power level of
240MW and it worked. 120MW didnt make it. It was ~10 Mi from the cellsite
using the standard duck antenna issued with the phone.

The tone detectors can be false-triggered by heterodynes from distant transmitters on the same frequency during band openings. Annoying if you're not a ham, but nice if you're into VHF DX!

3400. KENWOOD TM701A CROSS BAND MOD

Newsgroup: rec.ham-radio
Date: 1989-10-20 14:23:00 UTC
From: SKAGOO@MEMSTVX1.BITNET
Message-ID: <8910210938.AA01137@ucbvax.Berkeley.EDU>
Source record: 16266

TM-701A REPEATER CROSS-BAND MODIFICATION (REVISED)

This Mod is from KENWOOD

Perform The following modification to allow the TM-701A to operate in the repeater cross-band mose.

MODIFICATION:

1. Disconnect the power supply and antenna.

2. Remove the top and bottom covers (12 screws). Disconnect the speaker wire from the transceiver.

3. Locate the green jumper wire shown in figure 1. Using a sharp pair of wire cutters, cut the jumper in half.

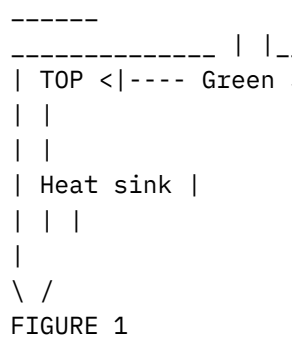

FIGURE 1

CATUION: Cutting the green jumper allows the TM-701A to transmit from 142 to 151.995 MHz. Protect your license by only using frequencies that you are authorized to transmit on.

4. Solder a jumper wire to the foil side of the TX-RX board as shown in Figure 2.

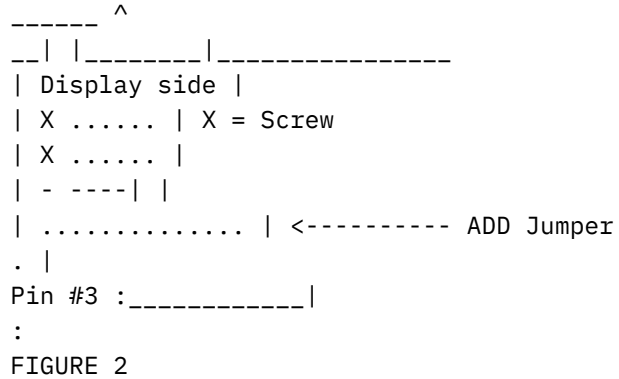

FIGURE 2

5. Assemble the transceiver by reversing steps 1-2.

6. Reset the microprocessor by holding in the MR key as the power is turned on.

The repeater cross-band operation allows the TM-701A to receive on one band and re-transmit the signal on the other band. The TM-701A alternately displays the two bands until a signal is received. The transceiver will then display the band that is re-transmitting the signal. The shift function cannot be used during the repeater cross-band operation. If the TONE or CTCSS function is required, only one EIA tone can be used for the two bands.

OPERATING PROCEDURE:

1. Select the operating frequencies for both bands.

2. Set the squelch control to the threshold point. The TM-701A will transmit in the repeater cross-band mode if the squelch control is set too low or a signal is received.

3. Place the transceiver in the duplex mode (F + DUP).

4. Press the F key for longer than one second. The F indicator will flash.

5. Press the LOW key. The transceiver will now enter the repeater cross-band mode of operation.

6. To cancel the operation and return to the VFO mode, press the VFO key.

3401. Aviation Radio: Info Required

Cross-posted to: rec.aviation,rec.ham-radio

I'm pretty familiar with the use of Voice comms over radio in the aviation world, however (as I'm also a radio nut :-), I'd like to learn more about:

VOR, DME, IM/MM/OM, NDB, TACAN, ILS, MLS

(and any other uses of radio for aviation purposes).

Would any of you care to post explanations of how these wonderful things work? I'll summarise if there's interest.

Thanks in advance

3403. How Much Good Does Ham Radio "Emergency Preparedness" Do?

Newsgroup: rec.ham-radio
Date: 1989-10-20 16:30:14 UTC
From: forrest@sybase.com
Message-ID: <6667@sybase.sybase.com>
Source record: 16272

For a long time I have watched and listened to many emergency
preparedness efforts that have taken place. I don't take part in
them because based on my experiences in several major earthquakes
and other lesser disasters, I've learned that most of this well
intentioned work doesn't amount to much. What usually happens is
that there is about 80% chaos, confusion, and needless running
around. My theory is that, with a few exceptions mentioned below, this
80% figure is what would occur naturally, with or without all the
emergency preparations.

Since I live 800ft above the Northern California Bay Area and can
hear almost everything that goes on on 2m, I had a good oportunity
to re-examine my feelings after the recent earthquake. If anything,
what I heard just reconfirmed my beliefs even more. This wasn't even
all that bad an earthquake, in spite of what you may have seen on
TV. If it had been really bad the confusion factor would have been
even worse.

The areas that I see that do benefit from emergency preparedness
are:

1. Making sure repeaters can stay on the air after the disaster.
2. Agreeing on which frequencies to use for certain purposes.
3. Having stations setup at key sites
4. Setting up liasons between civil defense organizations and ham
radio operators

Other than this, since ham radio is not a paramilitary organization,
I don't think there's much we can do to substantially reduce the
chaos and confusion. But, I don't think this is any big deal.
Most hams gladly and unselfishly lend a hand when problems occur.
I bet that most of the good work results from spontaneous organization
and natural talent rather than all the drills.

Please don't misunderstand what I'm saying. Ham Radio should play
a vital role in providing communications after a disaster. It has
proved itself many times. All I'm saying is that I don't think that
a lot of the organization and effort that goes into Ham Radio emergency
preparedness is worth it.

Anything you read here is my opinion and in no way represents Sybase, Inc.

3404. UK 'Student' license?

Newsgroup: rec.ham-radio
Date: 1989-10-20 16:44:33 UTC
From: PJML@UK.AC.NERC-WALLINGFORD.IBMA
Message-ID: <20.Oct.89.17
Source record: 16273

An addition to the code vs no-code argument. The RSGB here in the UK is proposing a 'student license' in addition to the existing class 'A' and 'B' structure. The proposal includes a 5WPM code test. Holders of the 'student license' would be allowed up to 5 watts CW on several of the HF/VHF bands, plus voice on 1.8/28/430MHz. The interesting thing is that the proposed 'student licensee' would not have to go through the examination procedure required for class 'A' and 'B' licensees. Hence we may have less 'qualified' (in terms of passing technical tests) hams having access to a wider range of frequencies than the more highly 'qualified' people! A very strange (and contentious!) position to be in.

The object of the 'student license' is alleged to be to encourage young people into ham radio (there is no suggestion of a minimum age for a student license holder).
However, including code proficiency is, IMHO, likely to be a great deterrent. The youth of today care not for pounding a code key - they are all into computers! Methinks the 'student license' will die a natural death.

A question: Would it really matter if there were no new hams recruited? We could all grow old gracefully, and discuss our latest illnesses/retirement homes/recipes for oriental dishes in the tranquility of uncongested bands......!
Pete.

3405. TAPR 9600 Baud packetRADIO

Newsgroup: rec.ham-radio
Date: 1989-10-20 16:55:35 UTC
From: mgb@APG-TECNET.APG.ARMY.MIL
Message-ID: <8910201655.AA06422@apg-tecnet.apg.army.mil>
Source record: 16127

First my apologies to hams that are not into packet for this posting. My feed from "info-packet" has been irregular or nonexistent lately.

Can anyone with an "in" with TAPR (Phil // Brian?) give us the latest scoop on the TAPR packetRADIO project? I realize that this is a topic for presentation at the Colorado Conference, but I was hoping for some advance info.

Rumor control has it that some of the units are now out in Beta test, and while I filled out the little form volunteering for that effort, I never received a reply. To get in a little plug... the whole state of North Carolina is VERY interested in acting as a Beta Test site for that project (and yes I am authorized to speak for the state :-)

I have seen the recent flyers from Kantronics advertising the 2 watt 9600 baud unit and also some blurbs from Paccom also hyping their product. The big draw on the TAPR unit is its proposed turn-around time and its higher power output of 25 watts. Does anyone have any idea whether these units are going to be compatible with each other and to what degree?

While I realize that using a TNC as a switch is now considered to be a rather primitive concept and that there are many better ways to go about it (and some rather astounding products are "in the mill"), this TAPR packetRADIO is EXACTLY what we are looking for in our stage of development and I honestly feel that we represent the feelings of a lot of others that are in the same situation.

Sooo... Any word on when this unit will be available, and at what cost, or answers to any one of the other questions?

Thanks in advance.....

Mark Bitterlich

I hardly think an Ecologist would find burning old paper and ink to
be "environmentally minded". Other than that it hardly seems like
you would get extra points for using something more inefficient
than a gasoline powered generator that still consumes large amounts
of fuel. A cute idea though. Would probably get you the extra points
for PR as I am sure you could get the local TV station to come out
and film it for the 11 o'clock news. :-)

> discussion invited. I feel sure the creative elements in the
> Ham community can solve the FD power crunch.

With all the engineers employed full time to try and solve the energy
problems of this country and the world I hardly expect Field Day to
come up with a solution.

3407. Quake Post Mortem Dump

Newsgroup: rec.ham-radio
Date: 1989-10-20 19:45:04 UTC
From: paulf@jessica.Stanford.EDU
Message-ID: <5970@portia.Stanford.EDU>
Source record: 16132

You're probably going to hear lots of quake stories in the next few days, so I'll try to keep this one short.

I was at home, listening to 20m (irony #1, to KP2V), and running a file transfer over the phone. We had about five seconds of "rolling" (eg, the feeling of "oh, it's just another earthquake") before the shaking hit (eg, the feeling of "GET UNDER THE DESK NOW!"). Spent the next 40 seconds or so watching the waterbed slosh around, hearing my Mac reboot as the power flickered in and out, hearing plates dumping out of the kitchen cabinets.

After climbing out (the house was still rocking for another minute or so), I took one look at my now useless HF gear, and grabbed for my 2m ht. The quake net was already going on 5.27, so I went outside to shut off the gas. Just about everyone was out in the street, wandering around. Made a quick (15 second) call to home (my mother was watching the World Series), and drove over to Stanford (no traffic lights, and rush hour traffic... fortunately, I was driving counter-commute). Ran the last mile to the trailers; we (N6UOK and my girlfriend) hauled out the generator, and got the VHF and UHF rigs going (N6BDE, WA6ITV, N4HUO, KX6T were already on campus and running the emergency net on 440 and 1.2). We then put the hf station on the air on 15, and spent the next seven hours or so working through a pile of inquiries. (Side note - DXing does indeed prepare you for handling emergency traffic, particularly pileup management.)

A substantial number of inquiries came from parents, wanting to know the conditions on campus (looks like we lost a few residence halls; we have about 600 homeless students). The long distance carriers were choking calls going into the Bay Area, and it was tough to get a line going out. Probably our main function on HF was trying to reassure people that things were not nearly as bad as the TV networks were portraying.

We moved down to 20m about three hours later; after about an hour on the same frequency, some bozo from "Peru" decided to take the frequency ("this frequency is in use betweeen Peru and San Francisco", and then lots of rapidfire spanish). We tried to continue, but then he went QRO, and we didn't have the generator capacity to light off the Alpha. We dropped down to 40m, which was pretty quiet, and someone set up a TV set in the VHF trailer. Most of us (now including N5PEE, N6MIO, N8JUF, and a few others) hadn't seen any news reports since the quake, so we sat down for a while to digest some of the sights. I was beginning to understand why so many people outside of the Bay Area were so upset...

I slept through a few more aftershocks before heading back to the trailers Wednesday; by that time, we had power again, and everything seemed to be winding down.

Unlike the Marines I am not looking for a few good men.
However I am looking for a few good TNC 1's.
Anybody have any idea where I might find some?? I want to do some software development/testing and I think the 6809 is a pretty good machine to play with. Add into that the fact that I think I have a pretty good software development system for the 6809 and you never know what might come out of it.
Now that everyone is looking at PS186's and 68302's there must be some TNC 1's taking up space that need to be disposed of.

Any suggestions??

Check out a copy of Wooden Boat at your local library or bookstore. I've often seen ads for engines right out of "African Queen". They run on wood or coal and have a long stroke and low RPM. You can get a range of engine HP from 1-10 or more.

Next week, making plutonium oxide batteries for those loooong mobile runs far from home...

> a PL tone or what?
>
> -- Scott

They use a single 1050 Hz tone transmitted before the voice bulletin.
I believe it is recommended that detectors "hear" the tone without
dropping for 5 seconds. I believe it is transmitted for 15 seconds.

The NOAA stations used to test this once a week. Wednesday at noon
was the standard for my local station, but I don't remember if this
was true everywhere.

I built a simple tone detector using a 567, which drove a 555 rigged
to work as a 2 minute monostable MV. The 555 in turn drove a relay
which switched the output from my receiver between an 8 ohm resistor
or the speaker. Thus, when the tone was received, the speaker would
kick on for about 2 minutes to allow the alert or warning to be heard.
At the end of the two minutes, it would go back into "silent" mode,
awaiting the next alert. I also had the output of the 567 driving
an SCR with an LED and N.C. pushbutton switch so that if an alert
sounded while I was away, the LED would turn on and remain on until
reset via the pushbutton switch. The 567 time constant was set to
provide detection after about 1 second, preventing it from "falsing"
on the normal voice transmissions.

A similar circuit can be used (with 2 567's and an "AND" gate) to
detect either a single DTMF digit, or the civil defense tones broadcast
by TV & radio ("this is only a test..."). Don't know the tone
frequencies for the latter, offhand.

I believe there may be a NOAA publication which gives details of the
alert system, but I'm sure its 1050 Hz.

>
> Solar is expensive, not so good at night.

True, but a couple of months ago Phil Karn and I put together an HF station powered by a gel cell which got *its* power from a solar panel. I ran the station at nearly 75 watts--including one QSO that lasted nearly an hour--and the gel cell was still in great shape. (And it was just a little one; Phil--how many amp hours?)

Oh, right--the gel cell was also powering a portable packet station at the same time.

So my experience that it doesn't take much to overcome the nighttime unavailability of solar power. Just a moderate gel cell (about $25) kept us going fine all night.

Patty

p.s. Apple VAX came back on line last night. Most Apple buildings were open today; almost all the rest will be early next week. Except, as someone pointed out, one of the main engineering buildings.

A few comments...

A device that works on the TDA method like the double ducky
but works much better is manufactured by Russ Andrews at BMG
engineering. It uses much better audio signal processing than
the QST double ducky.

I don't recommend the Dick Smith doppler. It uses a PLL to decode
the audio and simply doesn't have enough filtering. In addition, the
PLL loses lock easily or if it drifts, at which point you have
a meaningless display.

The old QST 8 antenna doppler, the Roanoke doppler (I think) and
the Doppler Systems dopplers all use coherent filters to process
the audio. These work MUCH better on weak signals. All three types
are in use here in Phoenix for our local hunt, and seem to
be operationally equivalent.

]That's not really true either. You saved the sponser the cost of hiring
]a commercial communications provider. Or even just leasing commercial
]radios and hiring operators to man them. I'll bet he didn't put the money
]he saved into his favorite charity either. ;-)

Most of the events that we work are put on BY the charity. If you really want to get silly about this, you can say that all these events are the normal business of the charity or whatever, and that ham radio only allows them to avoid the expense of hiring operators and radios. In fact, the areas that are in danger of hurricanes or earthquakes should buy radios and hire operators for the time when the disasters occur. Using a ham radio only allows these folks to avoid these costs.

MY TURN ON THE SOAPBOX

Give me a break!!! We can nit pick this to death. At some point, common sense has to get involved. If your activities primarily benefit the public, do them. If they primarily benefit the sponsor, don't do 'em. But... do some public service to help pay for the priviledge of being a ham, and to help out our image.

MUCH CALMER NOW, he steps off the soapbox and goes back to planning for the MS bikeathon.

I don't have the BMG, but I do know the creator of it, have
seen impressive demos, and like the technical approach. Russ
Andrews did a lot of work to figure out how to take the basic
"double ducky" approach and make it work right. If you have
ever tried serious DF'ing with a double ducky, you know it
doesn't work well - especially around multi-path. Russ has
a system that much improves on the double ducky, both by being
careful in the RF work (such as keeping everything balanced rather
than single ended) and in the signal processing.

The only reason I don't have one of these is I keep forgetting to
call Russ and order one. After our last T-hunt, I said to myself
once again that I would get one!

RC> Well, actually I would not call it a net. Maybe a chaotic
RC> dis-organization of interested parties, yes; net, no.

So far, that's about all the Fidonet "Net" is, too. Actually, we're
still
in the "Hey, is anybody from the Echo on here, or what???" stages...but it
could develop further. Maybe as more and more of us (me included) upgrade
or obtain the right HF rigs, we can go to 15, 40, or some other band.

BB>> Why not join us every Sunday at 1615 and 2215 UTC on 28.4 MHz, +
or -
BB>> a few kHz if there's QRM...

RC> Well, if the Saturday un-net were really a net, I'd probably go
RC> along with this. However, its not at all a net, just a place and
RC> a time. Also, that would be 10am and 415pm here, and I'm busy both
RC> those times, so would not be able to join the Fido net anyway.

Hummphh...go ahead and BE that way! Seriously, we kinda figgered that,
given the inherent vagaries of 10-meter propagation and the wide-reaching
intergalactic (OK, coast-to-coast) nature of these BBS Echoes,
mid-morning to Noon and mid-afternoon to early evening would provide the
most folks the largest chance of getting on.

RC> Since I plan to be on 10m (almost) every Saturday anyway, I'll
RC> continue the 'tradition' (?) of an un-net, as long as nobody minds
RC> too much. (Remember, I'm not trying to take away from the FidoNet

RC> continuing the un-net is a -bad thing- then I will change the
RC> comments about it in my .sig (but I will *still* be on 10m most
RC> saturdays at 1500Z, since thats the time I've set aside for HF
RC> Hamming, so I'll probably make some kind of comment about
RC> Saturdays no matter what.))

Go ahead with the Saturday un-net and have a ball. I'm sure many Fido
users will join you...I'll sure try! But, at least now everybody should
be
able to jump into a roundtable (better term than "net", hmm?) somewhere
and get some interesting conversations started on 10-meters.
Gad! Imagine if this was super-successful and led to a "generic" BBS
Users Net?? I suppose we could, theoretically, start at around

8:00 AM Pacific Time and just gabble away all day long...with enough "checkins", you could say Hello and not have your turn to transmit come around again until late afternoon!

RC> And on a slightly different subtopic of the same subject:

RC> I've been talking to someone in California who has asked that we
RC> try to hang around for people like him who find 8am CA time to be
RC> too early to be up. So if a few East Coasters (:-) would not mind
RC> hanging around for the California folks until at least 1600Z, they
RC> would probably appreciate it (at least, Alan would :-). I've also
RC> heard from someone who would most likely not be available until
RC> 1700Z. So don't think that it quits at 1600Z...

Ask Alan if he'd like to hook up with the Fidonet "Net" on Sundays at 1615 or 2215 UTC...28.4 MHz...listen for (or call) "CQ Fidonet HAM RADIO Echo Users", or something close to that.

RC> ....However, if it turns out like last week, I'll go work on my
RC> antenna!)

IASDT!! (It's Always Some Damn Thing) You live in Boulder County? I just moved back here after 2 years in Longmont. GOOD LUCK WITH ANTENNAS IN THE "UNSPOILED" ROCKIES!! And tell the granola-chomping Yuppie County Commissioners to stick their antenna prohibitions...!

RC> So, I'll be looking for *you* on 10 on Saturday. Remember - only
RC> 48 states left for usenet WAS! :-)

We're having my daughter's 3rd birthday party this weekend, but I'm going to be QRV whenever I can...maybe I can supply you with Connecticut!

RC> While I've got your attention, I'll bring up another question
RC> someone asked me. Should we totally ignore the ARRL and set up our
RC> own QSL system?...[stuff deleted]....Anyway, any thoughts?

Why is some wiseguy always trying to find some new way for us Amateurs to fritter away our time?? Besides, I don't have access to a laser printer, and I like getting nifty postacrds...beats just the bills that clog my mailbox!

RC> ---Join the usenet un-net, 28.410 and/or 28.390, 1500Z to 1600Z
RC> saturdays! Rusty Carruth. Radio: N7IKQ

In article <6667@sybase.sybase.com> Jon Forrest wonders aloud
as to the utility of ham radio emergency preparedness drills.

Like Doug Faunt, I've spent the last week on ARES nets in the Bay
Area. I think the overall performance was pretty good, and I think
some of that was due to prepardness drills. Take Field Day, for
example. Sure, although officially its EP, it's really more of a
contest. But the bottom line is you get a lot of practical experience
from it, and in my case, I got to become familiar with the people I
ended up working with for the last few days. I think that's a pretty
valuable thing.

And as Doug said, this event has been quite a learning experience. I
see very clearly now some errors we made, and I also see some things we
did right. I also think that life would have been much easier had we
been a little bit more prepared in certain areas. (For example, if the
ARES standard power connector had really been taken seriously; if the
various Red Cross centers would invest in VHF antennae and batteries;
if the local ARES group had thought about how to use packet radio in
time of emergency; ...).

My point is that EP *does* matter. It's certainly not of infinite
importance, but it can make things easier when every snag seems major.

>band that is re-transmitting the signal.

Ok, I give up... I've seen plenty of these "cross band mods" but I've never heard what they're used for. When do you need it? When is it useful?

Also how do these rigs do this? I guess since you're on different bands you don't need a duplexer but do ALL dual band rigs have two antenna connections on them? And how do you set your rig to talk/listen to a cross band repeater? Do you use an offset or is it simplex?

Thanks for any info!

faunt@CISCO.COM.UUCP asks:

> So, where are interesting radio museums?

There is a truly excellent, but quite small, wireless museum in St Margaret's Hope on the island of South Ronaldsay (2 58' W, 58 49'30" N). They publish a little book about the museum & wireless history.

Pay the museum a visit when you're next passing through! :-)

>80% figure is what would occur naturally, with or without all the
>emergency preparations.

I would say that most of that "80%" comes within the first few minutes,
until things settle down, people regain their calm, and the people with
practice training take over. EP drills tend to focus on equipment problems;
proper procedure can be learned by reading books, or DXing.

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Bengt Dalhammar

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2065

-------------------------------------------------------------------------------

TELEVISION--The Soviet Union has a new private television network called Nika
TV. The company hopes to on the air regularly in about one year. Nika's
president has already signed a contract in Hollywood for 5000 American films.
Nika TV also plans to cover ecological and economic problems, music, and
sports.

SATELLITE-TV--There are two new Swedish cable-TV channels about to make an
appearance. One is a pay-TV channel called SF Succe', set up between the
American film company Warner Brothers and two subsidiaries of Sweden's
Bonniers media empire, Svensk Filmindustri, which dominates film distribution
and cinema ownership in this country, and Marieberg, which owns Sweden's
biggest morning and evening newspapers. Warner Brothers is part of
Time/Warner, the world's largest media company, and already dominates
American pay-TV with Home Box Office and Cinemax.

SF Succe' is to go on the air in December. It will be competing with two
other pay-TV companies offering movies--FilmNet which broadcasts to the
Nordic and Benelux countries using different subtitles for each country, and
the new TV1000, owned by the same company that run the very successful TV3.

Swedish industry has taken the first steps towards a new satellite-based
commercial channel to be called TV4, expected to go on the air in September
next year, broadcasting to both Sweden and Norway.

ANGOLA--An Angolan station has been noted from around 21:15 hours on a
frequency varying around 5324.5 kHz, probably Radio Nacional de Angola in
Luanda, which used 4953 kHz for quite some time, then drifted around 4926-27
```

kHz for a while before disappearing entirely. No doubt they are experiencing the same kind of transmitter problems that caused them to wind up near this spot about five years ago. (Bob Hill, USA)

AUSTRALIA--A new study about Radio Australia calls for investments in new transmitters, as well as the development of new transmitter sites in Queensland, and outside Australia. In addition, beginning in December, the Radio Australia program schedule will reflect new target priorities in the south and southwest Pacific and Asia. (Radio Australia via BBC Monitoring)

BOLIVIA--Radio La Plata in Sucre has been noted around 17:00 hours on 9710 kHz. (Rolando A. Gimenez, Argentina) Radio La Plata is on the air from 13:00-19:00 hours on 9715 kHz. (Aboe Nawan Thaliep, Indonesia) The WRTH gives the frequency as 9716 kHz variable. (DX Editor)

Radio Horizonte has been observed around 02:00 hours on 5160 kHz, which is a move from the 4518 kHz used earlier. (Ivan Gabriel Barrera in "Onda Corta", Argentina)

ECUADOR--Radio Centro in Ambato is apparently a new station on shortwave, which has been heard around 10:00 and until sign off at 04:05 hours on 3290 kHz, suffering from interference from Radio Tayabamba in Peru on the same frequency. Radio Centro in Ambato has so far been listed on 1130 kHz. (Ole Forr in "ShortWave Bulletin", Sweden, and "Shortwave News", Danish Shortwave Clubs International, Denmark)

Radio Baha'i in Otavalo has been heard 12:00-15:00 hours and 00:00-02:00 hours on 4950 kHz with interference from Radio Televisi Malaysia on the same frequency. (Aboe Nawan Thaliep)

GUAM--The Adventist World Radio station KSDA has announced that it will install a third high power shortwave transmitter in 1990. With at least 100 kW the new transmitter will be used to enhance AWR broadcasts to East Asia. (Raveen Frederick, India; Aboe Nawan Thaliep, Indonesia; and Francis Lawlor, Ireland)

English from KSDA at 16:00 hours has moved from 13720 kHz and can now be heard on 11980 kHz. (Vidjit Vijaysanker, India)

The Voice of Hope can be heard in English 04:00-08:00 hours on 15225 kHz. It temporarily uses the facilities of KFBS. (Semenov Anatol, Siberia, USSR)

INDIA--All India Radio can now be heard in English to Australia and New Zealand 10:00-11:00 hours on 15335 and 21735 kHz, followed by a program in Thai 11:15-12:00 hours on 11850 and a new frequency of 21735 kHz. (Bob Hill)

IRELAND--Atlantic 252 recently increased power on 252 kHz longwave to 500 kW, which makes it a lot easier to hear. At sign-off at 18:00 hrs, the station says it continues via satellite. (Peter Lindqvist, Sweden and Darren Wells, England) If any listeners know anything about these satellite broadcasts, please let us know.

ITALY--Adventist World Radio in Forli is now on the air 06:30-07:30 hours on 7125 kHz and 07:30-14:00 hours on a new frrequency of 7230 kHz. English can

be heard 10:30-11:30 hours. (Salvatore Placanica, Italy and Edwin Southwell, England)

NORTHERN MARIANA ISLANDS--Updating SCDX-2064, when we reported that KYOI in Saipan is to be renamed KHBI, now that the owner, the "Christian Science Monitor", is reorganzing programming, KHBI was to resume broadcasting October 7th after having been off the air for transmitter repairs.

English programs are scheduled as follows: To South and South East Asia from midnight to 02:00 hours on 15435 kHz, from 02:00 to 0600 hours on 17865 kHz, from 10:00 to 12:00 hours on 15115 kHz, from 13:00 to 18:00 hours on 15385 kHz and 22:00 to 24:00 hours on 15335 kHz. There are also programs in English to Australia and New Zealand from 08:00 to 10:00 hours on 17855 kHz and from 12:00 to 14:00 hours on 15285 kHz. (Vidjit Vijaysanker and Edwin Southwell)

NORWAY--The Norwegian Students broadcasting station, UKE-Senderen, is broadcasting from Trondheim this year. Test transmissions began October 13th and regular regular broadcasts will be from October 20th to November 12th. The frequencies are medium wave 1485 kHz with 100 watts, shortwave 7225 kHz with l kW and FM 99.1 MHz with 100 watts. (UKE-Senderen Technical Director Bjoern Digre)

PHILIPPINES--FEBC, the Far East Broadcasting Company, can now be heard with a test transmission from 09:00-10:00 hours on 9800 kHz. This transmission carries the magazine program "Studio 10". (Babul Gogo, India)

SEYCHELLES--A new DX program, called "World of Shortwave" can now be heard from FEBA Radio on Tuesdays at 15:15 hours on 15325 kHz. (Sanil Deep, and Babul Gogo, both India)

UNITED ARAB EMIRATES--The Voice of the United Arab Emirates has been noted with programs in English at 22:00 hours on a new frequency of 13605 kHz. (Aristides Giannarelis, Greece)

INTERNATIONAL WATERS--After being boarded by the Dutch Navy in August, and closed down, Radio Caroline returned to the air on October 1st. The station can be heard from 05:00 to 17:00 hours on 558 kHz. The outlets on 819 and 6215 kHz remain inactive. (Bradley Allen, Roy Patrick, Stuart Dobson, and Edward Janard, all in England; Henry van Landschoot, Belgium; and A. A. Zijlstra, Netherlands)

PUBLICATIONS--"Onda Corta", edited by Gabriel Ivan Barrera, deals mainly with Latin American news, and includes a section in English, as well as with news from all parts of the world. A subscription costs USD 2 for every three issues, from: Onda Corta, Casilla 2868, 1000 Buenos Aires, Argentina.

"DX Post" is published bimonthly by the Universal DX League, a club with a membership in the +150 members range. The magazine costs 4 IRC's for a single copy or USD 8 for an annual subscription. For further information write to Universal DX League, 408 Krishna Nagar, Ludhiana-141 001, India.

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
02:30 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21655 kHz (East Africa)
18:00 hrs on 1179, 6065, and 7265 kHz
21:00 hrs on 1179, 9655 and 11705 kHz
23:00 hrs on 1179 kHz
00:00 hrs on 1179 kHz

And to Asia and the Pacific:

12:30 hrs on 15190, 17740, and 21570 kHz
14:00 hrs on 11905 and 17740 kHz
01:00 hrs on 7225 and 9640 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 48 contributors this week Good Listening!

3433. Re: Guemes Island followup

Newsgroup: rec.ham-radio
Date: 1989-10-22 01:36:15 UTC
From: tad@ssc.UUCP
Message-ID: <240@ssc.UUCP>
Source record: 16157

Fred, K1IO sez, regarding Guemes Island:

Well, Tad, it was a good hack, but I for one don't think it's a"new one" either.

What we see is an example of badly written rules. Laws aren't usually written by amateurs (legislators have staff assistants) and rules, like laws, have both a "spirit" and a "letter". Poorly drafted rules like DXCC rule 3b are prone to sloppy interpretation, but clearly the "spirit" of the rule was not to make Guemes a country.

Come to think of it, can you draw a line from Galveston Island, TX to some little island in Southern CA that doesn't cross northern Mexico? Campobello, ME to Mercer Is, WA without crossing Ontario?

Tad did a good job of proving that the DXCC rules are sloppily written. IMHO, not much more.

Tad sez:

Fred has a good point about drawing a line from Texas to California via Mexico. This is a problem with the rule writers not putting a maximum distance in the rule, and specifically saying that you don't need a minimum distance. Otherwise you could draw lines via the great circle route, and every island could be a new country!

Perhaps a minimum and a maximum distance should be specified in the rule.

But the question remains, what kinds of islands was rule 3b meant for? Only those that are not near the U.S., so that they seem exotic to U.S. hams? What about the rest of the world? Is DXCC only a U.S. oriented award?

There was one thing that I found very interesting when Rick Roderick (DXAC Chairman) called me on the phone the day before my Guemes operation. It sounded like from his comments that the current DXCC rules are meant to be exclusionary; that is, there never was any intention to allow any new countries to come out of the rewrite. This seems a shame. Nothing injects more excitement into the DX game than when a "new one" comes on the air. Now I am not suggesting that the DXCC list be diluted with hundreds of new countries, but if an entity qualifies under the rules, why exclude it? Rick kept treating my application as though it were done through some frivolous loophole, but to me the rule is very clear.

Tuesday night I had an enjoyable visit with my friend Victor, UA9OS, who is visiting Seattle. I was discussing with him this strange U.S. oriented bias that I spoke about in my posting, in which an entity may not be considered DX in this country if it is too close to the United States. I pointed out that if Guemes Island were in the Red Sea, that my application would probably be taken seriously.

To my surprise, Victor said, "Oh yes, we have the same situation in the Soviet Union with MV Island! Too close to Leningrad to be DX!"

Apparently many Soviet hams feel the same way about MV Island that some U.S. hams do about Guemes; not exotic enough to be DX! Not only that, but the folks who went there only had to ride a ferry (as I did to Guemes) to put it on the air! Certainly pales in comparison to Spratly or Heard.

Someone recently told me about an interesting definition of many of the DXCC countries that do not qualify under rule 1 (government). He said that a DXCC country is an entity, that at the time that a petition was filed for separate country status, did qualify under the rules at that time. Then when a rule was changed, or the status changed, it was grandfathered. I believe that Guemes should be given the same consideration.

There are many DXCC countries like this. Look at Alaska, Hawaii, and the various Soviet Republics. They would not count today, but did at one time, and so they are grandfathered under the rules.

So, what will happen? I think that Guemes could be approved if lots of hams really stop and study the rules and think about the things I have said. If Don Search really meant what he said in October CQ about how THE RULES MUST BE ENFORCED AS WRITTEN, WITHOUT EXCEPTION, then we have a good chance. But I fear he only meant it on an exclusionary basis; in other words, the rules must be enforced as long as no new countries are approved!

73,

SpaceNews

MONDAY OCTOBER 23, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* OSCAR-9 NEWS *

Max White at the Royal Greenwich Observatory reports that UoSAT-OSCAR-9 (UoSAT-1) decayed on Friday 13th October at 0751.49 GMT on Rev 44761.

Two possible locations for the final decay are given by different agencies as:

49.2S 220.9E
46.4S 220.0E

These locations are over the South Pacific and were probably out of range of any receiving stations. The last report of telemetry we have so far is from K9CIS at the Richmond Community College in the USA. They heard the satellite between 03:43 and 03:49 on 13th October, and reported good signal strength and nominal telemetry. Any telemetry or reports from the last 6 hours of UO-9's life would be appreciated by the UoS Command Station at the following address:

UoSAT Spacecraft Engineering Research Unit
Department of Electrical and Electronics Engineering
University of Surrey
Guildford, Surrey GU2 5XH
England

* OSCAR-13 NEWS *

Peter (DB2OS) reports that after reloading the onboard computer with IPS and the operational software, AO-13 was thoroughly checked out. The reason for the computer crash of "Black Monday" is still unknown, but all spacecraft systems are working nominally.

* GALILEO NEWS *

Galileo was boosted into low-earth orbit by the U.S. Space Shuttle ATLANTIS last Wednesday, and then boosted out of Earth orbit by a solid rocket Inertial Upper Stage (IUS). The spacecraft will fly past Venus and twice by Earth, using gravity assists from the planets to pick up enough speed to

reach Jupiter. Travel time from launch to Jupiter is a little more than six years.

The two ton Galileo orbiter spacecraft carries nine scientific instruments. There are another six experiments on the 750-pound probe. The probe's scientific data will be relayed to Earth by the orbiter during the 75-minute when the probe is descending into Jupiter's atmosphere.

Galileo Mission Schedule:

Venus Flyby (9,300 mi) Feb. 14, 1990
Venus Data Playback October 1990
Earth 1 Flyby (600 mi) Dec. 13, 1990
Asteriod Gaspra Flyby (600 mi) Nov. 03, 1991
Earth 2 Flyby (200 mi) Dec. 13, 1992
Asteroid Ida Flyby (600 mi) Sep. 02, 1993
Probe Release July 1995
Jupiter Arrival (*) Dec. 07, 1995
Tour of Galilean Satellites Dec. 1995 -to- Oct. 1997

(*): Includes Io flyby, probe entry and relay, and Jupiter orbit insertion.

* MIR NEWS *

Module-D (the Service Module) will dock with Mir at the forward axial port today. On Wednesday, Soyuz TM-8 is scheduled to be moved from rear docking port to Mir's foward facing axial port. Progress M-2 is scheduled to be launched on Friday, 27Oct89, and then will dock with Mir on 29Oct89.

** ITALY, NICARAGUA JOIN UOSAT-2 DCE GATEWAY NETWORK **

While engineers at UoS were busy building the UoSAT-D and -E satellites, two
new stations have joined the UoSAT-2 Digital Communications Experiment
(DCE) gateway network. A University Amateur Radio club in Managua, Nicaragua,
and an AMSAT group in Italy are the new active gateways.

After several months of work, Wes Morris (K7PYK) succeeded in establishing a DCE station at the Technical University in Managua, Nicaragua. Wes commutes to Managua frequently as an advisor to the University, and he has fitted the amateur radio club station for operation on all the AMSAT satellites. The station's call is YN3UNI. Student amateurs at the University will be using the DCE as an experiment in data communications and as a link to other radio amateurs for technical discussions.

The Italian DCE gateway was successfully put into operation during UoSAT-2 OSCAR-11 orbit 29947 on the 10th October, when I2KBD activated the DCE and sent mail to G0/K8KA at UoS. Alberto is now one of the three stations to operate the DCE in Europe (along with the Surrey command station and DB2OS in Germany) and will soon start a regular mail forward with the other DCE gateways world-wide.

Each DCE gateway station forwards Packet Radio messages for large groups of terrestrial groundstations. Active gateways are WB6GFJ (USA), ZL1AOX (New Zealand), VK5AGR (Australia), DB2OS (FRG), GB2UP (UK) and I2KBD (Italy).

[We just received news from G3AAJ that Ross (WB6GFJ) came safely through the California earthquake, but his gateway is out of commission until further notice.]

** OSCAR-13 STATUS **

Peter (DB2OS) reports that after reloading the onboard computer with IPS and the operational software, AO-13 was thoroughly checked out. The reason for the computer crash of "Black Monday" is still unknown, but all spacecraft systems are working nominally.

** $BID **

3436. Noise Blankers

Newsgroup: rec.ham-radio
Date: 1989-10-22 04:14:28 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <175500@Wayne-MTS>
Source record: 16160

I was playing with my modern all-synthesized fancy Kenwood 140, listening
mostly to Detroit Edison's nosier transformers and insulators, and
trying to see if the noise blanker would do any good (it wouldn't)
when I decided to give the little Yeasu FT-7 a try.

Surprise of surprises, the FT-7 knocked S-8 line noise down to
nothing and let the signals come cleanly through!

Now, the 140 works fine on ignition noise and woodepecker noise;
can't complain there. But why can't a modern $900 radio (or whatever
they are now) compete with a 10-year old (at least) FT-7? All
I can assume is that the TS-140 ignores very short noise pulses.
Whatever it is, that settles it: I'm going back to my dream station...
a pair of S-lines.

Anyone noise blanker mavens out there who can comment?

In rec.ham-radio, forrest@sybase.com writes:

> For a long time I have watched and listened to many emergency
> preparedness efforts that have taken place. I don't take part in
> them because based on my experiences in several major earthquakes
> and other lesser disasters, I've learned that most of this well
> intentioned work doesn't amount to much. What usually happens is
> that there is about 80% chaos, confusion, and needless running
> around.

My roommate listened on 2-meters the night after the quake, and had the
same comment. Lots and lots of working out logistics (which frequencies
for what, who, etc), and very little emergency traffic.

I was out of town the whole week, so I couldn't tell him otherwise.
I hope that things went more efficiently than he described.

From: winter@Apple.COM
Message-ID: <35828@apple.Apple.COM>
Source record: 16164

Through the courtesy of ClariNet, a news service distributed through the uucp network which includes items from UPI and other press agencies, I'm posting the following item about hams helping with relief efforts for this week's earthquake. (I don't know much about ClariNet other than that we recently subscribed to it at Apple. Write to them directly [info@clarinet.com] if you need more info.)

Although it isn't mentioned in the article, Stan Harter is himself a ham.

This is a good, solid article. Congrats to Stan or whomever made it happen!

Patty

Subject: Ham radio operators link quake victims
Message-ID: <Uquake-hams_41@clarinet.com>
Date: 21 Oct 89 17:36:35 GMT

SACRAMENTO (UPI) -- Minutes after Tuesday's earthquake disaster, when people were desperate to communicate and telephone lines were suddenly jammed, ham radio operators at state emergency headquarters took to the airwaves.
No sooner had the earth stopped shaking when the elite corps known as RACES -- Radio Amateur Civil Emergency Services -- swung into action. They manned the radio room at the state Office of Emergency Services headquarters 7 miles from the Capitol and have kept it going around the clock, receiving and relaying reports on death, damage and destruction as well as demands for supplies and assistance.
``In an emergency you never have enough communications,'' Stan Harter, assistant chief of telecommunications for the governor's Office of Emergency Services said in a Friday interview.
Harter supervises the radio operation that acts as a backup for telephone communications in emergencies and also links the OES to disaster areas without phone service.
Hams relayed reports on road closures, whether someone's relative had turned up dead or alive, and instructions to move supplies around. Messages flew from the earthquake ravaged communities to government emergency centers.
``We're purely communicators. We don't originate anything. We don't act on the messages,'' said William Musladin, a RACES operator and retired Air Force lieutenant colonel who has been tinkering with radios since 1934.

Three of the OES's six regional offices statewide were heavily involved in the earthquake emergency.
Most of the state agencies and many county and city governments in California have RACES ham operators on standby to jump in and move vital information in a crisis.
In event of major fires, floods or earthquakes, the radio room becomes a nerve center of the OES, the agency that coordinates all the state agencies involved in the emergency and takes stock of the situation from hour to hour.
The radio room has a mixture of old and new technology. Venerable two-way radios squawk with party line chatter from far away voices, and silent high-tech computers flash a bulletin board of information on a sceen.
The ``hams'' who operate the radio room are volunteers, federally licensed and registered with the OES. There are 35 RACES members in the Sacramento area.
``They put in thousands of hours (of work),'' Harter said.
Les Ballinger, assistant radio officer for the state Department ofTransportation and a radio buff since high school, began serious ham work after a stint in Korea with the Navy.
He shows up during major brush fires to string up two-way radio communications at remote California Department of Forestry and U.S. Forest Service fire camps to put them in touch with the outside world.
``It's exciting going into a fire camp with no electricity,'' Ballinger said, recalling how more than once he has used a slingshot to hoist a radio antenna into a tall pine tree.
The system came in handy during the 1986 floods across Sacramento and has been relied upon heavily during every emergency since, including the 1988 ``49er'' brushfire.
Today's two-way radio technology has added new features the hams of yesteryear didn't have -- computer printouts of the information so there is a tangible record, and color video cameras that can photograph a disaster from land or air and immediately transmit the pictures to a television screen in the radio room.
``You feel good when it's over. There's personal satisfaction in being able to help out,'' said William Pennington, who retired from the Air Force as a master sergeant in July. He has been a licensed ham for 27 years.

3440. Solar Power

Newsgroup: rec.ham-radio
Date: 1989-10-23 03:04:35 UTC
From: rlwest@flopn2.csc.ti.com
Message-ID: <8910230319.AA22245@ti.com>
Source record: 16165

Re: Dicussion thread regarding SOLAR POWER...

I took delivery on a Sovonics "25 watt" solar panel just before Field Day.
We used it to charge Gel Cells and ran our 75m phone station and my video
camera to tape some of the field day activities.

I more recently added a deep cycle battery (105 amp-hour "RV" or "Marine")
as described in the Sovonics documentation.

I encourage anyone with the slightest interest to follow up on whatever
source and arrangement they can. Solar energy is not the answer to all
the problems, but it sure is one approach.

On a recent "walk-a-thon" my remote station attracted more attention for
the solar panel than for the antennas and radio and posters.

73,
Bob WA8YCD

> that 4 or 5 hams within the local areas making calls to check
> loved ones for hams who had seen pictures of the collapsed freeway
> and bridge section was wrong.

The long distance lines are a sort of bottleneck. Since many phone exchanges
were probably still down, of all INCOMING calls, many were probably futile and
would certainly waste long distance bandwidth trying the locals. However, the
OUTGOING calls were far more likely to work. This assumes that H&W calls were
appropriate at the time (another issue altogether).

Messages could also be passed around within the blocked area over VHF nets
to enter each exchange locally, or potentially be hand delivered if anyone
was set up for that. Live patches would certainly have been nothing more
than relieving the long distance bottelneck (and not helping the local load).

> The telephone network held up very well, considering everything.
> Within 14 hours of the earthquake, using MCI or AT&T, it only
> took about 7 or 8 attempts to get through to 415 from Seattle.

Some may argue that for H&W inquiry, this was still too early to try.
I just can't say.

> One intersting story I heard was that AT&T had a main fiber optic
> cable, with a capactiy of hundreds of thousands of calls, running
> under the collapsed bridge section on the bay bridge! When
> the section collapsed, it took a major AT&T route into SF with
> it!

I wonder what the LD total capacity into SF is, compared to intra-bay-area.

> My mom works with a fellow who needed to call a pottery shop in
> SF, so he waited until 5:01 PM Tuesday, when the rates got
> cheaper. He was talking to a fellow in the shop, when the
> guy remarked that "OH...we seem to be having one of those little

> fellow sounded VERY upset....followed by a HUGE CRASH (remember, this
> was a POTTERY shop!) and CLICK! We figure the click was the sound
> of the AT&T FO cable being severed.

Knowing that aftershocks can and do happen (and there were 1000's measured and 100's (??) felt, including a couple up to 5.0) I would assume a pottery shop would take some precautions for an extended length of time to pretect any remaining inventory. Gee, hope there was not too much loss there.

From: phil@ux1.cso.uiuc.edu
Message-ID: <30500252@ux1.cso.uiuc.edu>
Source record: 16169

For those of you interested, a mailing list has been set up to distribute earthquake related information. Automatic subscription can be done by sending the command:

SUB QUAKE-L <fill-in-your-name>

as the text of a message by E-mail (or interactive message within Bitnet only) to one of these addresses:

listserv@vm1.nodak.edu
listserv@ndsuvm1.bitnet

To send messages to the whole list, change "listserv" in one of the above addresses to "quake-l".

To get back issues (in VM/CMS notebook format, which has a row of ='s between each message) send the following command:

GET QUAKE-L LOG8910C

To the "listserv" address. Be sure you don't send the commands to the list by mistake, that will make you look like a fool. The above file will soon be closed out as a weekly file and the next file name will be used, so you might also want to do:

GET QUAKE-L LOG8910D

SUMMARY OF MEDIA CLIPPINGS

THE WALL STREET JOURNAL, 10/18.

MEDIA: PROGRAMMERS BET VIEWERS WANT TO INTERACT WITH TV, p.B1.
"Consumers may want to move their telephones a little closer to the TV set...Two weeks ago, viewers of several NBC daytime consumer segments started calling a 900 number for advice on various life-style issues...Interactive telephone technology has taken a new leap in sophistication, and television programmers are reaching to exploit the possibilities. Eventually viewers may grow bored with the technology and resent the cost. But right now programmers are figuring that viewers who are busy dialing up a range of services may put down their remote control zappers and stay tuned."

USA TODAY, 10/18.

1M CALLERS JAM CITY'S PHONE LINES, p.5A.
"San Francisco's quake sent phone companies, banks and airline reservationists scrambling to conduct business. Up to 1 million callers may have swamped phone lines in five minutes alone. On city streets, people lined up 20 deep at pay phones. Pacific Bell asked people to keep lines free for emergency calls."

WASHINGTON UPDATE, October 17, 1989

AGE OF TOUCH TONE
CALLING DAWNS AT FCC

STATUS: The FCC is being rapidly refurbished by its new management. Potted plants recently appeared in the lobbies of the two main FCC buildings on M Street in Washington and touch tone phones, yes, touch tone phones, are being installed in the offices.

COMMENT: The new chairman, Al Sikes, is living up to his reputation as an excellent conciliator.

He has pleased Congress with his positions on various issues and he is now gaining FCC staff approval by improving their work environment. FCC staff have long been embarrassed about their antiquated rotary dial phones.

THE WALL STREET JOURNAL, 10/17.

DOESN'T EVERYONE NEED TO BE KNEADED ONCE IN A WHILE?, p.A1.
"Stressed-out employees find office massages a balm...Although such sessions may never replace coffee breaks, one-site massage, as it is known in the trade, is certainly infiltrating corporate America...office rubdowns usually take place in dimly lighted conference rooms, where stressed-out employees

relax in specially designed chairs, fully clothed. The massages last 15 minutes and typically cost about $10. Some companies, including Heinz, even pay part of the fee."

3445. Weather Radio

Newsgroup: rec.ham-radio

Message-ID: <8910250702.AA02160@ucbvax.Berkeley.EDU>
Source record: 16170

NWS was working on a project a few years ago to use DTMF tones,
instead of the 1050 Hz tone, to activate weather radio receivers.
The DTMF system would allow "intelligent" weather radios to tone-
activate only for *specific* counties (as determined by the owner
of the receiver). In the Chicago area, for instance, the NWR
transmitter is located atop of the Sears Tower (about 1800 feet AGL).
When the tone is issued, half of Illinois, parts of Indiana, Michigan
and Wisconsin are alerted. I haven't been keeping current on the
DTMF project but since I haven't seen any DTMF weather receivers
at Radio Shack I assume the project is on hold. ...Chris...

3446. Heath 2060A Tuner review

Newsgroup: rec.ham-radio
Date: 1989-10-23 15:08:46 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <175720@Wayne-MTS>
Source record: 16171

In response to an inquiry:

I bought a 2060A about a year back when I was running QRO and working on my WAN (worked all neighbors). I bought it on the advice of two locals who think it's the greatest thing since sliced cheese; I have a different opinion.

First, there are a few parts that I think are *very* poorly engineered. The push-button switches on the front panel require a lot of odd patches; clipping a terminal strip and soldering it to the switch assembly was one. It's not clean construction. The knobs are cheesy and easy to strip; the counter assembly is pretty cheesy for a $300+ kit, too.

Some of these faults may be a resulty of my ham-handedness; I had to be very careful when spinning the roller inductor. It could easily be spun past its stops, and then required removing the cover and diddling about to restore.

Mine is for consigned for sale at a local store, replaced by a small MFJ. I always hear people slamming the MFJ line, but the darn things are well built. I may not be alone in disliking the 2060A; I saw a few advertised in the yellow sheets for under $175 and $200.

As a side note, I picked up the 100W Heath tuner kit at a close-out deal at a local Heath store. Again, some parts are just too cheesy and underbuilt. The rotary switch can easily be rotated out of its keyed stop; the antenna terminals are #6 or #8 screws on a piece of phenolic- the kind you see used as a speaker terminal on cheap stereos. At least this one only cost me $20.

Now in the works is a cartridge version of Digicom64, the TNC emulator program
for the C64/128 (see my article in August '88, 73 Magazine for info).
The cartridge is autobooting and permits parameters to be stored to the
cartridge, eliminating the need for the disk drive, for those of you without
a drive. This also makes it ideal for hilltop digipeating with a minimum of equipment.
Further info to follow as it becomes available. 73/Barry, W2UP

From: doug@edson.ee.UAlberta.ca
Message-ID: <1989Oct23.170351.19638@edson.ee.UAlberta.ca>
Source record: 16173

A couple of weeks ago I asked for your opinions about a propagation program
call "miniprop" written by Shel Shallon, W6EL. I got two replies, both
favourable. They're short, so I run them verbatim. The current version
of miniprop is 3; it is no longer shareware - send $50 to W6EL:

Yes, I invested $50 in Miniprop, and it is great! The big difference
that I notice is that instead of just giving MUF, it also gives
projected signal levels for every half hour, along with an ABCD
rating for probability of communication. I run mine on an AT clone
running at 12 MHz. I recommend a math coprocessor, especially if
you are doing simultaneous studies for more than one band.

73,
Tad Cook
KT7H @ N7HFZ
tad@ssc.UUCP

Doug Konrad writes:

> Do any of you have any experience with a program called MINIPROP? It is
> a propagation forcaster written by Shel Shallon, W6EL.

I've been using version 2.0 on a trial basis here for about a month,
and it seems to work very well, based upon a "stations heard" analysis.
I had some concerns about the speed when I read the documentation, but
it only takes a few seconds to crank out a point-to-point prediction
on a 10 MHz AT clone with no math processor.
BTW, I downloaded it from a ham-related phone bbs, and version 2.0,
at least, is shareware. I plan to buy in.

73,

It seems to me that the rule about two islands being separated by foreign territory is referring to a case where either of the islands would have been a country by itself (being 275 miles from the mainland). In this case, you would have two instead of one country. I don't believe it is intended to make islands less than 275 miles away separate countries. The reason for the rule is apparently an extension of the rule that says once you have one island 275 miles away as a separate country, subsequent islands that are also 275 miles away need to be separated 500 miles (or whatever the number is) from the first island. What they're saying is that foreign territory is a substitute for the 500 miles. Neither Guemes island or the other island is 275 miles away, so this rule never even comes into play in the first place. So Tad is taking the rule out of context.

I think this admittedly poorly written rule is similar to the second amendment to the constitution that says something like:

"A well regulated militia being necessary to the common good, the right of the people to keep and bear arms is not enfringed".

Some people have claimed its OK to take the second half of the sentence out of context and claim the bearing of arms is a right of the individual not the militia. Again, admittedly it should have been written more clearly, but the courts have consistently refused to take it out of context. Hence, Don Search can use the same line of reasoning and still say he is a "strict constructionist."

I have the Sovonics panel, as purchased from Antennas West, and am quite happy with it. I also have the 8A regulator they sell, and am not so happy. I gets quite warm -- I'd guess at least two or three of my hard-earned watts are going into heating the package. It makes clicking noises, so I assume it has a relay in it. I'd think a power MOSFET would do a better job! It also seems to stick sometimes, as I can see the charge LED dimly glowing at night sometimes.

If anyone has a more efficient gel-cell regulator, I'd like to hear from you.

>
> 73, Bob W3OTC

Smitty (W3GKP- SK) was also on one end of the first 2304 EME QSO, with a large dish and 1kW Klystron courtesy of the MARS program- this was back in 1970. The Klystron, a Varian VA-802, now resides at the shack of Al Ward WB5LUA and has a small plaque on its magnet commemorating the feat. It is used with great respect regularly.

Sigh. The list of the pioneers who have joined the ranks of the Silent Keys is rather staggering, indeed. Just saw some pix at our most recent Rochester VHF Group meeting of Mel Wilson, W2BOC and his station, describing some of the methods he used to predict VHF propagation enhancements- especially Aurora, years ago.

Does anyone have anything good or bad to say about Madison Electronics Supply in Houston TX? They have the Kenwood TM731 for $599. until the end of November.

Also, has anyone comments on running a 721/731 as a remote base? I've talked to several people who've had it work pretty nicely, and I think it would be real useful to be able to just use a HT, and move freely throughout a building, and have the 731, in a vehicle, with a good antenna, and in a good location, act as a remote base.

In search of better RFI shielding, I am planning on replacing my 286
clone's cabinet with one of the rack mount cabinets from Integrand.
I have used their cabinets before, back in S100 times, and know they
are of high quality.

The only problem I am having is deciding on a configuration. The cabinet
itself is inexpensive ($100), but the custom power supplies that Integrand
sells run around $200 extra. It is difficult to tell from the drawings
supplied by Integrand in its catalog just how difficult it would be to
mount a "standard" supply in the cabinet.

I would appreciate any information anyone has regarding this, particularly
from individuals who have bought raw cabinets from Integrand.

> I was out of town all week, so I didn't have a chance to tune in.
> How smoothly did things go?
>

The Sonoma County RACES net was started very shortlt after the
shake by a net controller at his home. The OES Emergency Operating
Center position was established at 18:15 with two operators: a command
net and a resource assignment net. About a dozen mobile stations were
deployed to assess the damage to roads and services within Sonoma
County. By 19:30, it was clear that this county had minimal damage,
and the net was turned over to traffic with bay area stations.

The California Department of Forestry Volunteers-In-Prevention
(CDF-VIP) radio net was assembled (with many of the same RACES
operators) and they worked throughout Tuesday night to set up radio
links with amateur CDF stations in the Santa Cruz mountains. These
hams carried emergency requests as well as health and welfare traffic
until the net was closed at 19:00 on Saturday night. In addition,
they passed traffic on the Northern California UHF linked repeater
system (440.5 MHz), which was primarily used as a link between the
state OES headquarters in Sacramento and OES and Red Cross stations in
the affected areas.

Some Sonoma County hams also traveled to Alameda County to act
as communications resources for the rescue base set up at the I-880 collapse.

All told, I thought the traffic was fairly productive and
organized once the initial logistics were worked out. There was a
dose of confusion, but I think it was small given the conditions.
There was, in my opinion, too much non-willful interference on 2m from
stations passing unimportant traffic (ie chewing the rag) on or near
important frequencies. Also: a high speed digital net (de N6GN) and
the appropriate end stations would have been neat to see...

I am looking for any and all information on a Telemobile Inc,
Commercial 440 rig. I have no information on this radio, I just
purchased it at a Hamfest. Telemobile is somewhere in California
probably L.A. I need control head schematics and probably radio
drawings as well. Any information would be appreciated.
73's Dennis

For the most fascinating Numbers story in the past 25 years, see the November issue of Umbra et Lux. This newsletter, which focuses on covert radio, SIGINT, espionage, intelligence and counter-intelligence continues to be free for the asking and a #10 SASE.

The November issue will be available next week. Send for your copy to:
Umbra et Lux
DX/SWL Press
Department U/kk
10606-8 Camino Ruiz, Suite 174
San Diego, CA 92126

If you're a Numbers-chaser this story will blow you away. This isn't hype, guys - this is for real!

Havana Moon

3461. Voice of America Scheduled Broadcasts

SPAN.....Spanish
SWAH.....Swahili

TURK.....................................Turkish
UKRA.....................................Ukrainian
URDU.....................................Urdu
UZBE.....................................Uzbek
VIET.....................................Vietnamese

`TIME' lists the beginning and ending time of the broadcast in
Coordinated Universal Time (UTC or GMT).

`Freq' is the transmitter frequency in kilohertz.

`Rly' is the transmitting relay station location, as follows:

ANT Antigua, West Indies
ASC Ascension Island
BAK Bangkok, Thailand
BLZ Punta Gorda, Belize
BOT Selebi-Phikwe, Botswana
BY Bethany, Ohio
COL Colombo, Sri Lanka
DL Delano, California
GR Greenville, North Carolina
KAV Kavala, Greece
MUN Munich, Germany
MVA Monrovia, Liberia
PHL Poro or Tinang, Philippines
TAN Tangier, Morocco
WER Wertachtal, Germany
WOF Woofferton, UK

`kW' is the nominal transmitter output power in kilowatts.

`Azi' is the azimuth of the signal's major lobe, in degrees
true, from the transmitting station.

`Note' indications, where present, mean:

$ - Tu-Sa
& - Mo-Fr
* - Sa/Su
A - Target: Europe/N. Africa/Middle East/S. Asia
B - Target: Africa
F - Target: Africa
LA-1 - Target: Latin America
LA-1A - Target: Latin America programs to the Caribbean
LA1A - Target: Caribbean
LA-3 - Target: Brazil
P - Target: Far East/Oceania/Pacific

LANG Time(UTC) Freq Rly kW Azi Note

THE KENWOOD TM-701A WILL ONLY CROSS BAND REPEAT ONLY ON SIMPLEX
FREQUENCIES.

DOES ANY BODY HAVE ANY MODS FOR THE KENWOOD TH75A HANDHELD DUAL BANDER
??? IF SO PLEASE POST OR E-MAIL THEM TO ME

THANKS IN ADVANCE

Source record: 16087

I just got a blurb in the mail today about a Local Area
Wireless Network. The manufacturer is O'Neill
Communications Inc. of Ralegh NC. Specifications in brief:

Frequency: 902 to 928 MHz
Speed: 38,400 bps
Channels: 4
Transmit power: 20 mW
Modulation: spread spectrum
Antenna: internal array (omnidirectional)
Protocol: AX.25 (X.25 standard for radio) [Really!]
Contention: Carrier Sense Multiple Access (CSMA)
Coverage inside buildings: 10,000 sq. ft. (typical)
Range unobstructed in space: 500 ft. (typical)
FCC license: not required

Photos show a box that looks like an external hard disk that
plugs into the serial port of a PC, with special models
available for printers and modems.

Thoughts:

1. Looks like the 902 MHz band plan isn't going to matter
one way or another to weak signal users.

2. Ham radio HAS contributed something to radio technology
since SSB in the fifties.

Message-ID: <891024054249.4b000127@CCC.NMFECC.GOV>
Source record: 16109

Group,

Does anyone do much experimenting with R/C? Since I don't have
too much time, I have combined my hobbies and am flying model planes on
6 meter R/C. I would like to know if much design/modification is done to
the equipment. Recently I bought some used ACE R/C equipment and have had
good results with it. The design is somewhat dated, but I can get all the
diagrams, parts, and help with no trouble from ACE. This is different
from the other import units which charge $5 for a 50 cent control pot.
Also I am eyeing the new computer controlled transmitters, but the $500
plus price is out of my league. Any homebrew ideas in this direction?
Where do I look? The Ham mags have very little on the subject. Does anyone
know where I can get Plessy ICs and data sheets from? The back-of-the-mags
ads suppliers don't seem to carry them. Finally, anything good or bad about
ACE products? The people around here seem to think they are quite good.
The only mod I have done so far is to change the throttle so that
the trim only affects the idle and not the high end. Thanks is advance.

KI4NW

> Cliff Yamamoto de KA6JRG

Almost all modern dual band rigs have a built in duplexer so you
don't need two separate antennas. Operation is simple,: you
set a receive frequency on one band and a xmit freq. on the other.
I have a new ICOM 3210 (2m/70cm) with this feature. What's neat
is that you can hear a signal on the receive frequency while
you are transmitting. If you are using a "cross band autopatch"
this feature allows full duplex telephone conversations, just as
if you were using a regular or cellular telephone. If you think
about it, there is no need for an "offset" s: you are automatically
transmitting on the repeater receive frequeency and listening on
its transmit frequency (a big offset, if you will, in different bands!).

By the way, I am new to the world of dual band rigs and cross band
repeaters. Does anyone know of such beasts (x band repeaters)
in the Chicago area? Cross band autopatches?

Also: I have been reading this net for a while, but have never
written anything. Hi, all! An interesting net (altthough the
CQ Pizza stuff did drag on a bit :)).

> I don't expect this package will stand up against the like of a PK-232,
> but hey, it's 1/3 the price and if you just want WX maps, it'll do.

Actually, it may be better than a PK232. A PK232 deletes all but 1 out of n lines (where n is something like 6, depending on the aspect ratio), with the result that most of the text on the weather maps is lost. With the PK232 you just get a general idea of what's on the map; a good bit of detail is lost.

Regarding recommendations for equipment, personally I use the A&A Wefax demodulators; if you just want black & white HF charts (not satellite pictures with grey scale), the FM demodulator is around $35. Elmer Schwittek in Florida sells a "MultiFax" program that is a compiled BASIC program which reads the output from this demodulator through the game port or printer port (the parallel printer port can be used for 1-bit data such as is produced by the FM demodulator; the AM demodulator produces 8-bit data, and has to use at least the game port (4 bits) to get reasonable grey scale images). He just came out with a new version of the program, and I don't remember the new price, but the old version was $35. This hardware also works much better than the FAA-surplus electrolytic-paper WEFAX recorder I bought for $600 a few years ago, because the grey scales are better and the image is sharper. I subsequently wrote my own software (not very portable), which isn't too hard to do, but the Schwittek software is a good start.

But, see my next posting, on a problem with the A&A AM board...

3468. Anomaly in A&A AM WEFAX Demodulator's ADC

Newsgroup: rec.ham-radio
Date: 1989-10-24 13:54:58 UTC
From: roskos@IDA.ORG
Message-ID: <1989Oct24.135458.28372@IDA.ORG>
Source record: 16082

Recently I have added an 8-bit port to my PC for use with the A&A AM WEFAX demodulator kit (the original, unmodified kit), and wrote some software to plot a histogram of the data coming out of the A/D converter on the demodulator board. What I've found is kind of surprising.

The output from the board has *very* sharp "spikes" at each of the values at which the low-order four bits of the output from the A/D converter are zero (i.e., hex 00, 10, 20, 30, 40, ... , e0, f0) with a very small amount of clustering of values around each of these spikes. But the frequency of these low-order-bit-zero values is usually 10-20 times that of the values nearby that don't have zeros in the low-order bits.

This seems very odd, since I was receiving AM WEFAX images from NOAA 9 when I collected the data I used to plot the histogram, and I don't think the NOAA satellites have data distributed in this way. The A&A demodulator's A/D converter is wired in an unusual way, though... the /INTR output pin is wired to the /WR pin (the normal connection for the "free running" mode), but the /RD pin is also wired to 0V. Programs that access the demodulator just read the demodulator periodically, without any status information, and without any control of starting a new conversion cycle.

I'm wondering whether this A/D converter, wired in this way, fairly often gives intermediate output values, in which the high-order bits have been determined but the low-order bits haven't been determined yet, and whether this causes the distribution I found? I looked up the A/D converter in my National Semiconductor databook (the equipment's at home, but I believe it is an ADC0804), and I can't tell from the diagram whether the latch that's between the shift register and the output latch only passes completed data through, or whether intermediate data goes through to the output latch (which I think is always in the "pass" rather than the "latch" state due to /RD being grounded). In any case, it looks like the board as supplied from A&A doesn't properly output the low-order bits of data, something that doesn't show up if you just connect it to the 4-bit game port the way the instructions recommend. I found in looking at the data that the image produced with the low-order bits included is very noisy, something that I think is due to this problem more than to noise from the received signal.

Does anyone have any insights or experience regarding this? Meanwhile I'm going to try modifying the board to let me start conversions immediately after I read the previous value, the way the ADC is designed to operate, in the hope this will fix the problem...

(If you have any suggestions, please mail to me and I'll summarize.)

3469. Internet DXing

Newsgroup: rec.ham-radio
Date: 1989-10-24 15:17:00 UTC
From: Ed@ALDERAAN.SCRC.SYMBOLICS.COM
Message-ID: <19891024151751.3.ED@PEREGRINE.SCRC.Symbolics.COM>
Source record: 16110

Having just seen an electronic mail message from a country whose two-letter abbreviation I don't recognize and couldn't guess from context, I've decided to try for DXCC (and WAS, for that matter) via Internet. (The ultimate Internettish thing would be WAD, Worked All Domains, but domains are created far more often than countries.)

To invent some rules:
1. Messages exchanged via bulletin boards don't count: the messages must be exchanged via mail. It's perfectly ok to post CQ's to bulletin boards, but there must be two-way communication via mail to qualify as a contact.
(If this game gets too popular, we may need to set up a separate bboard for it, lest INFO-HAMS/rec.ham-radio become an unusable pileup!)

2. In lieu of signal reports, QSL messages should include the text AND HEADERS of the message being replied to. This provides propagation information, such as the number of relay stations and the number and kind of mail protocols involved in the conversation.

3. A completed contact should be a message that looks like this:

```
j From: Ed
j To: Faraway-Joe

e From: Faraway-Joe
e To: Ed

x From: Ed
x To: Faraway-Joe

x I saw your CQ in INFO-HAMS; here's a response from
x Burlington, Massachusetts USA.

e Thanks for the response Ed, I'm in Farawayville,
e Neverneverland.

j Here's your confirmation, Joe.
```

The message marked x is an initial call, it doesn't count (unless you want to play by SWL rules, in which case it counts for Joe.) The lines marked e (with the included lines marked x) form a completed contact for Ed: it's proof positive that he communicated with Joe. The lines marked j (with all the included lines) form Joe's completed contact. The actual format (order, indenting, etc.) of the information doesn't matter.

4. Of course, you can include whatever other information you want in your messages, like your rig (Sun-3/60 w/8meg or whatever), other hobbies/interests, weather, latitude/longitude/altitude, whether you're operating from the home or work QTH, etc.

So, CQ IDX (Internet DX) de Ed@Stony-Brook.SCRC.Symbolics.COM, in Burlington, MA USA!

Mine doesn't do that.

The KA8IDB control module that came with my panel is quiet and cool.
It *>is<* the second one...the first one did not work and I had to get a
replacement.

Maybe you can get them to replace the one you have?

73, & good luck! --> please keep us posted on what solution you come up with!

3471. Re: PL259 connector assembly

Newsgroup: rec.ham-radio
Date: 1989-10-24 16:18:01 UTC
From: forrest@phobos.sybase.com
Message-ID: <6736@sybase.sybase.com>
Source record: 16105

My problem with soldering PL259 connectors is that I'm paranoid
about overheating the connector, causing the dialetric inside
the coax to melt resulting in a short of the center and outer
conductors.

What wattage soldering irons work the best for this? Soldering
through those 4 holes is also something that worries me because
to do it right requires a lot of heat. Heat can be both my
friend and my enemy when soldering PL259 connectors.

Anything you read here is my opinion and in no way represents Sybase, Inc.

In article <6667@sybase.sybase.com> forrest@sybase.com writes:
>For a long time I have watched and listened to many emergency
>preparedness efforts that have taken place. I don't take part in
>them because based on my experiences in several major earthquakes
>and other lesser disasters, I've learned that most of this well
>intentioned work doesn't amount to much.

Not this time. What is amazing is how well coordinated the response
has been, at least in the Santa Clara Valley area where I'm listening
and involved with ARES. Each of the city EOC's was up with in about
20 minutes of the disaster. Several, including my city were essentially
cut off from the rest of the county. We became their eyes and ears for
during the first 2 to 3 hours. Los Gatos EOC was evacuated! They didn't
have ANY phones as an example. This is where the planning and drills
come in. At least in Santa Clara County we are also the prime movers
of data for the Red Cross. The one on-going assignment we've got right
now is providing communications for all of the shelters that have
been set up in the middle of no-where.

>What usually happens is
>that there is about 80% chaos, confusion, and needless running
>around. My theory is that, with a few exceptions mentioned below, this
>80% figure is what would occur naturally, with or without all the
>emergency preparations.
>
>This wasn't even
>all that bad an earthquake, in spite of what you may have seen on
>TV. If it had been really bad the confusion factor would have been
>even worse.

Go see Los Gatos or Santa Cruz in person, then tell all the people
in shelters in Watsonville, Santa Cruz, and Los Gatos it wasn't all
that bad an earthquake. It certainly could have been worse, but
it was bad enough!

>
>The areas that I see that do benefit from emergency preparedness
>are:
>
>1. Making sure repeaters can stay on the air after the disaster.
>2. Agreeing on which frequencies to use for certain purposes.
>3. Having stations setup at key sites
>4. Setting up liasons between civil defense organizations and ham
> radio operators
>

There are a couple areas that you've missed.

1. Training a core of people who know what they are doing so they
can be the managers in a situation like whats going on!
2. Knowing where the weakness is in your organization allows you
to correct the defects. You can't find this out without drills.

>Other than this, since ham radio is not a paramilitary organization,
>I don't think there's much we can do to substantially reduce the
>chaos and confusion.

Nope. See point number 1. The people who drill year round, and
receive extra training like learning about the Incident Command System
used by served agencies, or take part in Public service events where
they learn about operating in nets, and responding to extended events
in a prepared manner are important people right now! The people
who are walking in off the streets are welcome, and their basic
skills as hams is useful, but we also need people on sight who
can show them how our organization works, how to operate on nets, how
to be a net control, etc. We wind up having to do on-the-job training
and this can only be done by people who have been drilled into knowing
how to do the job we have to do!

Side note considering personal confusion. I didn't really experience
any because I had a purpose and a place to go immediately. I knew how
I was going to react before it happened, it was a planned response to
the situation. Thats not to say I wan't scared, but I did know what
I had to do, as did my entire city ARES organization. This actually
seems to help ALOT with dealing with the initial situation.

>But, I don't think this is any big deal.
>Most hams gladly and unselfishly lend a hand when problems occur.
>I bet that most of the good work results from spontaneous organization
>and natural talent rather than all the drills.
>

See above.

>Please don't misunderstand what I'm saying. Ham Radio should play
>a vital role in providing communications after a disaster. It has
>proved itself many times. All I'm saying is that I don't think that
>a lot of the organization and effort that goes into Ham Radio emergency
>preparedness is worth it.

Let me give you a couple examples of where training paid off immediately.
In Santa Clara County we have a plan called MCIP(Medical Casualty Incident
Plan) Its caused us to pre-place antenna drops at all of the hospitals
AND drill twice a year with them and various area fire departments
at implementing the plan. Oddly enough we had one of those drills
last Saturday ;-) The hospital net was on the air almost immediately.
Up at Stanford the doctors where trying to figure out where there was
a working Cat Scan in the county, they had a bunch of people at a
phone bank trying to find out. The hams came through with the info

in about 5 minutes. We were already at the locations they wanted to get in touch with. We have a drill locally every time there has been a minor quake. The drill is simple, show up on 146.115 and listen. If you have any damage report it to net control. This little drill has the benefit of getting us lots of people available when it was the real thing because people knew exactly where we would be coordinating efforts.

Mind you our response hasn't been perfect, but due to the drills we've carried out over the years we know what should be done and we try to fix things as they occur. There are also things that can be done better and we'll try to learn from the whole experience. Thats another point...we have a collective learning experience as an organization about what works and what doesn't. The propagation of this knowledge to others who join the group keeps it fresh, and helps us improve as new view points are added.

>Perry Scott
>KF0CA

Hmmm. Well, I dunno about that, I just repaired the coax I use in
the car for my 2M rig, which was RG11 or some such thing, and in
my previous attempt to repair it (which resulted in the coax
to braid short I repaired last night) I had soldered the 4 little
holes to the coax. I was able, with a little difficulty, to remove
the previous coax and re-use the connector. Am I missing something?
Will the 'repair' break sooner than it normally would? Or am I just
tenacious enough to make it work?

One caution I have about doing the soldering (assuming that I've not
overlooked some other reason having to do with ability to reuse
the connector) is that you really need to be careful to not overheat
the coax and thus melt the foam/whatever. I speak from experience!
(Thats why I had to repair the coax the second time...)

73 and happy soldering!

It helps if you first take a knife and scrape around the insides of the 4 little holes before screwing the connector together. I've had trouble getting solder to adhere to the metal, but if you scrape away some of the surface, solder takes to it without much ado.

Could this be all because of a recent geomagnetic storm I have heard
about? I can't recall just now when it actually happened, but it was
supposed to be fairly intense. I haven't touched my radio for a couple
of days (I know, an unpardonable sin...), so I hadn't heard it myself.
I haven't heard any mention of the storm on the net here, so I didn't
think much about it. Does anyone have any particulars on this storm??

Source record: 16104

Given the (still) low number of dual band radios out there in people's hands so far, a cross-band portable repeater won't serve too many people very well just yet. The idea of linking them and spacing them apart (though I think a 1/4 mile is overkill) seems like a workable solution. This is something I have been planning to do as well. That way you can input and output a standard in-band repeater split on 144, 220, or 440 Mhz. You will of course need a total of 4 HT's or other radio's to pull this off. That's getting to be fairly expensive. The new dual-band Icom IC-32AT (and maybe others) does have a builtin crossband repeater function that could be used as TWO of the radios. Two crossbanders could be used to set up the in-band repeater.

I disagree 100%. Training BEFORE an emergency is vitally important.
This has been demonstrated time and time again.

Let me give but one example. Several years ago, we had some severe flooding
in Guerneville, along the Russian River near Santa Rosa. Our RACES group
had been rather inactive for several years, so while we had lots of operators,
many had never had any training.

Guerneville was an island -- completely cut off from the rest of the world.
A message came through asking for permission to break into the Guerneville
Safeway (or whatever) to get food for the hungry masses. The reply message
said basically "Yes". No signature. No addressee. No time or station
of filing. I don't know about you, but I sure wouldn't break into a store
with no more CYA than that! One of the first things you learn in RACES
(or ARES etc.) training is about message format.

Sure, there's going to be confusion and chaos in a disaster no matter how
prepared you are, but the preparation DOES pay off -- the better trained
you are the more you come to realize that.

Rick Karlquist, N6RK says:

>It seems to me that the rule about two islands being separated
>by foreign territory is referring to a case where either of
>the islands would have been a country by itself (being 275 miles
>from the mainland). In this case, you would have two instead of
>one country. I don't believe it is intended to make islands
>less than 275 miles away separate countries. The reason for the
>rule is apparently an extension of the rule that says once you
>have one island 275 miles away as a separate country, subsequent
>islands that are also 275 miles away need to be separated 500
>miles (or whatever the number is) from the first island.
>What they're saying is that foreign territory is a substitute
>for the 500 miles. Neither Guemes island or the other island
>is 275 miles away, so this rule never even comes into play
>in the first place. So Tad is taking the rule out of context.

Tad, KT7H says:

Actually, Rule 3b stands alone. But if you choose to interpret it as
part of Rule 3a, the mileage figure is 75 miles, not 275 miles.
Guemes, in relation to Tatoosh, meets this test. But rule 3b
SPECIFICALLY states "NO MINIMUM DISTANCE IS REQUIRED".

Here is the full text of Rule 3b:

"(b) Islands: Where two islands, of the government under Point 1,
are totally separated by an intervening DXCC country (also under
Point 1), each island counts as a separate DXCC country. No
minimum distance is required. The test for total separation
means that a straight line may not be drawn from any point on one
island to any point on the other island without passing through
another DXCC country. This intervening country may be a part of
either island, another island, or part of a continent."

Date: 1989-10-25 06:47:11 UTC
From: die@cpoint.UUCP
Message-ID: <2711@cpoint.UUCP>
Source record: 16106
Cross-posted to: rec.ham-radio,sci.electronics

In the mid 1970's it was widely reported that the Soviets uplinked tapes
of intercepted American telephone calls picked up from AT&T microwave by their
embassies and consulates in Washington DC, NYC, and SF on frequencies in the
900 mhz range (which was(?) an uplink frequency for one of their then-in-use
communication satellite families). I have heard stories that the NSA taped
the Russian uplinks and played the tapes for selected high officials of some
of the big companies the Russians were targeting in order to convince them
to take telephone (un)security more seriously.

I beleive that it was reported that the Russian tapes of US calls
were sent at 20-100 times normal speed multiplexed on some sort of very
wideband signal. It appears that no very secure form of encryption or
signal security was used, however, since NSA was willing to allow people
outide of the COMINT intelligence world to listen to their intercepts
(which they would have been very unlikely to do if they had any reason
to beleive the Russians thought they were using a secure mode of transmission).

Out of idle (and poisonous) curiousity I am tempted to speculate as
whether this practice continues to this very day, and if so what frequencies
and technologies are currently being used ? With so many vital communications
circuits carried by fiber, (especially those near foreign embassies) and
with the much greater consciousness of signal security in the last few years
it would seem that the fruits of such an effort might be much less useful
than they once were, but perhaps once started such an effort acquires a
certain momentum and cannot be so quickly stopped.

Has anybody living near the Soviet compounds seen these signals ?
Do they use their Moliyna birds which swing high up over our northern sky?
Or is this done by low orbit store-and-foreword ferrets ?

At the very least these uplinks ought to supply somewhat more tractable
material for a certain lunatic fringe than KGB/CIA/etc one time pad
encrypted "numbers stations". (Although the technical proficiency required
to make anything of the signals (even if not encrypted) probably grossly exceeds
that conceivably possessed by anyone who wastes time trying to break one time
pad spy ciphers from numbers stations).

Responding to the questions about recent HF blackouts...
Yes, there have been several magnetic storms during
the past week. The biggest was Saturday. It was the
result of an X-13 flare (that means BIG). A number of
other flares have been popping off the past couple of
days and a major storm is predicted for today (10/25).
This means a good chance for aurora on the VHF bands, and
stinko conditions on HF.
If you can't copy WWV, you can get the solar-terrestrial
report by calling (303) 497-3235.

3492. Antennas 'Umbrella-shaped'

Message-ID: <25.Oct.89.12
Source record: 16113

Antenna that looks like a big inverted umbrella - looking in my ANDREW catalog
there are various versions of this - they are all broadband HF antennas
(typically 3-30MHz or 1.6-32MHz). My book shows them with up to 160Kw
peak handling capacity, with a SWR of less than 2.0:1 throughout the
design operating range (envy envy...)
Wouldnt like to be in the room below a 160Kw transmitting antenna though!

They are omni-directional and known either as 'Spira-cone' or 'Mono-cone'
antennas (both being trademarks of Andrew Inc. Orland Park IL)

The ANDREW catalog is worth browsing through - full of nice products
for professional/military applications HF through microwaves.
See if you can get your hands on a catalog - you will go green with
envy!!!!!!
Prices are as high as you would expect for 'professional' products though...

When I was a kid and couldn't afford to buy new PL-259s (they were
fifty cents in 1965), I used my Dad's electric drill to drill out the
solder from the four holes and reuse the connectors.

There are some PL-259s that I would never use, like the ones
with a meltable insulator -- it looks white, like teflon, but
it melts like cheese.

Also, I've not been able to get solder to stick to AVA brand
connectors, so I only use Amphenol PL-259s, with silver plated body
when available.

I use the same coax preparation process that John KB8RY described, but
spray silicone spray on the black coax jacket before screwing on the
connector barrel. My soldering tool of choice is a behemoth 60 watt GE
solding iron (not a gun) to solder RG-213/U to PL-259s.

Source record: 16028

I happened to be at the Christian Science Monitor Headquarters last week and I picked up a brochure about a deal that they had on the Sangean ATS-803A. They were offering it for sale for only $179 (with headphones, power supply, antenna adaptor and strap). The radio does come with the CSM logo affixed to it but if you can live with that it seems like a deal. They were also selling the Sangean MS-103 for $115. I'm only posting this since there have been several requests for inexpensive SW receivers lately. I couldn't find an address to write to but you could try sending mail to 'The World Service of the CSM' in Boston for more details. As far as I know, the radios are capable of picking up stations other than that of the CSM :-)

I have owned a Ten-Tec Omni D for about 9 years. It's technology is
no longer state-of-the-art, but I have been very pleased with it.
Ten-Tec designs the box so you can access all the circuitry and
service it yourself. Their customer/technical service is excellent,
much better than the big-name manufacturers, or so I hear.
Example: last year I had a minor problem with the receiver. I called
their factory service number and I was immediately put in contact
with a guy who knew every detail of my 8 year old box ("check the
5K resistor on circuit module x, the one just to the left of the
transformer....."). He gave me a 8 point check list to find my
problem ("you don't want to pay $50 for us to look at it").
Once I found the problem, I called him back and he sent a new part
on credit (total cost: 12 bucks plus two phone calls).

Performance of the rig is good. Its QSK is superb. Very clean audio
on SSB. The final amp transistors take a 3:1 swr with no problem
and full power output. It's simple, basic design seems to be
very reliable, with few things to go wrong.

Bob Parnass, AJ9S, just bought a Paragon, and I wouldn't be surprised
if he posted his comments on it (he told me he liked it).

3497. Aviation NAVAIDS (long)

Newsgroup: rec.ham-radio
Date: 1989-10-25 14:03:16 UTC
From: MEHARP01@ULKYVM.BITNET
Message-ID: <8910260703.AA00903@ucbvax.Berkeley.EDU>
Source record: 16043

Aviation NAVAIDS are some of the slicker applications of radio technology that you will ever find. Here is a brief core dump of what I know about them. My apologies if some of the actual technical info is incorrect or incomplete. My knowledge is mostly from the user view since my father is a retired air traffic controller. In that spirit, here's Mike's Little List of NAVAIDS:

VOR - Stands for VHF Omni Ranging (I think). System uses a ground-based transmitter that sends a phase encoded signal that looks like a "radio compass" to the receiver. Pilot uses a receiver in the cockpit to home in on the VOR. There is a huge network of these transmitters around the country. They form the nodes of a large grid of aerial highways that are used for navigation. A typical transmission using a VOR may sound like "Cessna 27G, turn right heading 240 proceed direct MYSTIC." This instructs the pilot to turn onto heading 240 degrees and follow the signal from the MYSTIC VOR to the VOR. When he gets there, he will either receive further instructions or follow his flight plan. VOR's were one of the earliest NAVAIDS.

ILS - Instrument Landing System. System uses radio signals (I don't know what frequency, I think microwave) to generate a glide slope signal to landing aircraft. This allows a pilot to land an aircraft safely in marginal conditions. Most airliners use ILS even in clear weather because it's actually easier. The pilot just follows an indicator in the cockpit which indicates if his rate and angle of descent are correct. If you want to hear irritated pilots, catch your airfield with it's prime runway's ILS down! :-). Approach control will handle the aircraft until it reaches the "outer marker" of the ILS. This is the first indication received from the ILS. Generally approach will tell the aircraft to contact the tower at that point with "TWA 424, contact the tower 120.3 at the outer marker."

DME - Distance Measuring Equipment. Related to VOR. Gives a dead reckoning distance to the NAVAID generating the signal. An optional addition to VOR's. Useful with a busy VOR or a remote one. If you have VOR and DME in your plane (not all do, it's not required) it's really difficult to get lost. Also nice when setting up for an approach.

Those are the three that I know something about. Hope you found this useful. If you really want to learn how these aids work, the latest version of Microsoft Flight Simulator does simulate these three aids. My brother tells me the simulations are quite good.

At the very least these uplinks ought to supply somewhat more tractable material for a certain lunatic fringe than KGB/CIA/etc one time pad encrypted "numbers stations". (Although the technical proficiency required to make anything of the signals (even if not encrypted) probably grossly exceeds that conceivably possessed by anyone who wastes time trying to break one time pad spy ciphers from numbers stations).

Someone trying to break one-time pad ciphers is certainly wasting his time, IF it is known that the system is one-time. As far as I know (and I don't claim to be an expert) the numbers transmissions have not been proven to be one-time ciphers. Even if the transmissions are intended to be one-time, mistakes are made, and if a section of key got accidentally reused there is some (very slim) hope that a transmission could be decoded.

>friend and my enemy when soldering PL259 connectors.
>--Jon Forrest WB6EDM

To avoid melting insulation, the soldering must be done FAST. For
that you need a high-wattage iron with a LARGE copper tip. I get
excellent results using a WW II surplus 200-watt soldering iron. (A
200w soldering _gun_ is no good because the tip lacks sufficient heat
capacity). The large tip transfers heat to the PL-259 fast enough
that the area around the hole reaches soldering temperature before the
whole connector gets hot enough to melt insulation. Tin the coax
braid before inserting it into the connector.

3502. Down with SO239 connectors!!

Newsgroup: rec.ham-radio
Date: 1989-10-25 16:06:42 UTC
From: PJML@UK.AC.NERC-WALLINGFORD.IBMA
Message-ID: <25.Oct.89.17
Source record: 16114

Why, oh why, do manufacturers insist on fitting PL259/SO239 connectors
to their gear? A more horrible connector for RF is hard to think of.
(anyone remember RCA Phono-plugs being used for RF wiring some years back?)
At anything above DC, the PL259 is horribly lossy and non-constant-impedance.
Unless you tighten them up real tight (like with a small pipe wrench!) they
unscrew themselves and oxidise after a few years.
The worst ones are the 'SO239-on-a-flying-lead' fitted to some of the
modern mobile rigs (and this at 144/430MHz too!!) which seem to plumb
new depths of flimsy construction. Whilst we can't all afford to go for
'N' connectors at HF, anyone interested in long term reliability should
studiously avoid SO239 'UHF' types. Specially avoid those where the center
insulator melts when you solder the inner. If you must use them, get ones
with PTFE insulation (which costs a bit more but stands solder temperatures
without melting away...) Long live BNC/TNC (specially above 30MHZ).
Try thinking of SO239's as 'screened test-prod connectors'. Throw 'em out
and fit something 'constant impedance'.
Also, how come there seem to be two different threads on the SO239? Jap
and 'Rest-of-the-world' ? They wont mate!

Look in the FCC Rulebook published by ARRL. The previous edition, at least, has a 'phone number that you can call to find out this information.

3504. Re: Anomaly in A&A AM WEFAX Demodulator's ADC

Newsgroup: rec.ham-radio
Date: 1989-10-25 17:08:18 UTC
From: roskos@IDA.ORG
Message-ID: <1989Oct25.170818.1007@IDA.ORG>
Source record: 16115
Cross-posted to: rec.ham-radio,sci.electronics

The story continues ...

Last night I modified my previously unmodified A&A board to bring the
/RD and /WR lines from the A/D converter to the set of pins on the edge
of the demodulator board.

After doing this, and building the logic on the 8-bit port board to generate
the /RD and /WR pulses when the port was accessed, I connected it all
together, and found that the problem still exists! So it is not due to
incomplete conversions being read from the board. It appears simply to
be a problem with the demodulator board itself... possibly that the
A/D converter that is used is too slow to convert a particular value of the
demodulated signal before it changes to a new value, so the ADC gets partway
through the conversion, finds the value has changed significantly, and
gets 0's for the low-order bits as a result.

The distribution of values out of the A/D converter is interesting...
the values with low-order bits of zero seem to "borrow" from neighboring
values, and the height of the spikes is in proportion to the number of
low-order bits that are zero. For example, a portion of the curve looks
something like this:

```
--------
-------- <- these 3 show what the frequency counts "should" be
--------
6FH --
70H -----------------
71H ---
72H ---------
73H -----
74H ------------
75H ------
```

I did some testing with artificially-generated files to be sure it's not the
histogram-producing software (it's not); and with random white noise (it gave
a plausible distribution of the white noise, but with the "borrowing" anomaly
as shown above).

At this point I don't have a good idea as to what might be causing it.
It doesn't adversely affect the WEFAX pictures you get if you only use
4-bit data, and in fact the pictures are very good considering the price
of the demodulator (both the AM and FM demodulators purchased together
cost around $85), but it means you can't do enhancements of low-contrast
areas of the image, or other types of image enhancements that rely on
having data at a higher grey-scale resolution than you are able to

display.

It looks like some artifact of how the ADC works... I have an ADC0820 which I am thinking of trying to see if it works better (the A/D converter on the A&A board is an ADC0804), since the ADC0820 has a built-in sample and hold, and can convert at around 20,000 samples/second.

>or obtain the right HF rigs, we can go to 15, 40, or some other band.

I've thunk of that, but wondered how many of us (like myself) we'd lose. (At least for a while, while the upgrade is in process, for those planning to upgrade. But I'm under the impression that some folks are not interested in that. ALso, part of the reason for doing this was to have someone to talk to when I heat up the old HF rig (I started to say warm up, then remembered that its a tube rig :-)). Another part of the reason was to get some of us (myself included) off our duffs and onto the airwaves (oh, oh - I see some really nasty comments coming :-)), and to perhaps encourage some of us (again, myself included) to think about upgrading. So to move to a General or above subband would defeat part of the fun/purpose I had in mind when starting off the concept.)

Yow! I hope not! I 'need' to talk more often than that :-)

> RC> And on a slightly different subtopic of the same subject:
>
<discusion of east and west coast contacting each other and hanging around>

Actually, I was looking at my map (yep, I finally got around to marking up
a map to see where all I'd talked to), and noticed that CA is really not
that much closer than the closest eastern contacts I've made. I've noticed
that western stations seem to come in in the evenings, and eastern stations
come in better in the mornings. (Is this a reasonable conclusion? I
don't know, but am willing to be instructed :-))) So I'm probably biasing
my activities towards the east coast. I'll definately try to be back to
410 and/or 390 (+or-) at 1700Z and 1800Z as well (note - new time coming
this saturday!).

> Ask Alan if he'd like to hook up with the Fidonet "Net" on Sundays at

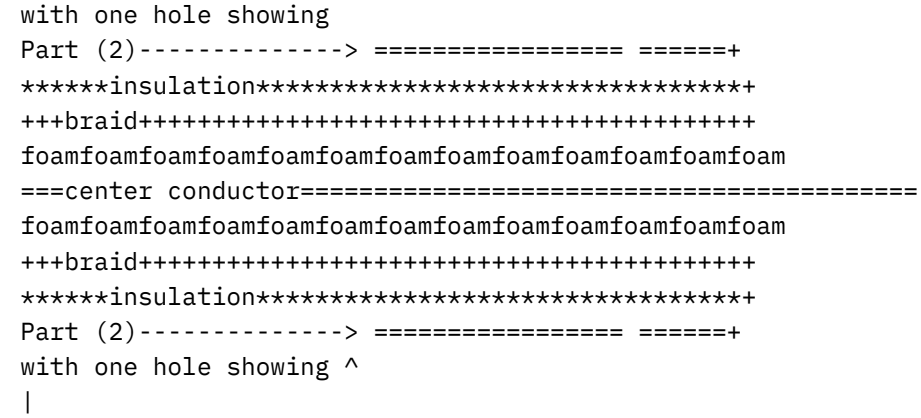
>conductors.

I was taught another way to put PL-259's on coax that gets around
the whole problem of soldering through the little holes. I wish I
could draw a picture, but I'll try to explain in words instead:
(Unfortunately, I don't even have one here in front of me to help
me remember, but I'll try from memory!)

Disassemble the PL completely (I recall there can be either two or
three parts:
1) the "male" part which has the four little holes
2) the part which screws into part (1), and
3) an optional part which screws into part (2) and which is used
only when the coax doesn't fight tightly into part (2)

a) If part (3) is needed, slide it onto the coax and forget it awhile.
b) "Skin" the appropriate amount of outer insulation from the end of
the coax, cut through the braid, skin some inner (foam?) insulation,
etc. (many manuals give measurements for how much to cut off.
c) Do NOT "fan" out the braid, but squeeze it down around the center
conductor (kinda like licking a sewing thread) and slide the coax
into part (2) like sticking thread through a needle's eye. Push
the coax up tight as far as it will go. If part (3) is not used,
one may even screw part (2) onto the outer insulation of the coax;
if part (3) is used, screw it into part (2).
d) NOW fan the braid out at a 90 degree angle but do NOT fold it back
over the forepart of part (2). Then use scissors to cut the braid
off SHORT so it just barely clears part (2). See "picture":



e) Carefully solder the braid to the EDGE of part (2) | right here,
all the way around the end of part (2).

f) Screw part (2) into part (1) tightly (use two pairs of pliers).
Solder center conductor to part (1).

Forget the four little holes altogether!

Electrical connection depends on metal-to-metal contact of parts
(1) and (2). I've never had any problems (and I've long been
eligible for the QCWA!) Connector is trivial to disassemble (if
you can find the pliers again) and to reuse.

} Does anyone do much experimenting with R/C? Since I don't have
}too much time, I have combined my hobbies and am flying model planes on
}6 meter R/C. I would like to know if much design/modification is done to
}the equipment. Recently I bought some used ACE R/C equipment and have had
}good results with it. The design is somewhat dated, but I can get all the
}diagrams, parts, and help with no trouble from ACE. This is different
}from the other import units which charge $5 for a 50 cent control pot.
}Also I am eyeing the new computer controlled transmitters, but the $500
}plus price is out of my league. Any homebrew ideas in this direction?
}Where do I look? The Ham mags have very little on the subject. Does anyone
}know where I can get Plessy ICs and data sheets from? The back-of-the-mags
}ads suppliers don't seem to carry them. Finally, anything good or bad about
}ACE products? The people around here seem to think they are quite good.
} The only mod I have done so far is to change the throttle so that
}the trim only affects the idle and not the high end. Thanks is advance.
}
}
} KI4NW

I am cross posting this to rec.models.rc which has far more Ham R/C stuff
than rec.ham-radio. From your posting I assume you know (or are learning) how
to fly the airplane with no problems.

Briefly, you need to get one of the modeller's magazines such as "R/C
Modeller Magazine". Best bet is a local hobby store.

There is very little experimentation with radios any more, mostly because of
the availability of very cheap but high performance Japanese/Korean radios as
a complete pakage. Futaba, and Airtronics are the two dominant brands today,
both have simple basic 4ch AM radios which include servos, receiver, transmitter
and batteries for around $100 discounted. A 2 ch is even less but not
recommended for aircraft. The channels BTW refer to CONTROL channels not
transmitter channels, all modern R/C equipment is built for a single RF
frequency but can have as many as 20 control channels.

The more expensive radios essentially have more features or better
interferance rejection (FM or PCM), but really are little different
otherwise.

ACE is the only American manufacturer that I know of, and serves mostly the
advanced and experimenter markets. Reputation and my own experience has been
excellent, but their equipment is much more expensive than the imported

equivalent. (I don't own any of their radios just auxiliary stuff like a fast charger). All of their radios BTW are AM, but with probably the best quality receiver on the market which more than makes up for the difference with FM/PCM etc..

Things like servos and AM radios BTW are easily interchangeable between manufacturers if you don't mind changing connectors.

As for using 6M, I would advise picking one of the "standard" frequencies: 50.8-50.9 (R/C 00-R/C 10), or 53.1,53.2 through 53.9. Monitor the channel you pick for a while to be sure there isn't a repeater there (we have one on 53.76 which wipes out 53.7 and 53.8). Oh yes make SURE you use a transmitter pin/impound etc. just like the 72Mhz people do, there are fewer users of 6M R/C but I have had people on the same channel as me (twice in 18 months).

Good luck!

*Mike Waters AA4MW/7 waters@dover.sps.mot.com *
Of course there's no reason for it, it's just our policy.

3512. Re: How Much Good Does Ham Radio "Emergency Preparedness" Do?

Just to add one point to Steve's excellent observations: I'll bet you didn't start hearing the "overhead" communications until the real "emergency" situation was over. Because you probably weren't listening in the first hour or two.

My experience with the earthquake disaster here was that by the weekend, much of the communication was ham radio logistics rather than real emergency traffic. But that isn't our fault, really. The main reason for this was that the Red Cross etc. were able to ask for (and get) all the support they wanted from us, even if they didn't really need it. That's probably the way we want it to be: we want them to always want to come to us, not to hesitate because we might get uppity or cut them off later.

In contrast, *all* the traffic I heard in the first couple of hours had to do directly with the emergency, and was extremely well organized and coordinated. All of Steve's points apply to what I heard.

Sure we got help from everybody with a radio, and that's great. But it only worked because there were people who knew what to tell them to do. And they didn't all come out Tuesday nigth!

Are you saying these two islands are more than 75 miles from the
mainland? My understanding was that you could actually see Guemes
from the US mainland. That would be less than 75 miles normally.

3515. Re: Solar Power

Newsgroup: rec.ham-radio
Date: 1989-10-25 22:43:06 UTC
From: <>
Message-ID: <18057@bellcore.bellcore.com>
Source record: 16030

Regarding solar panels, regulators and such... When Patty and I assembled that portable station last summer, I cobbled up a very simple shunt regulator consisting of a 2N3055 power transistor, a heatsink (important!) a resistor and a zener diode. It was wired such that when the array voltage rose to 15 volts, the regulator began conducting, clamping the voltage at that level. This was mainly to protect the radio from overvoltage if the battery (a 6.5A-hr gel cell, by the way) were disconnected.

The advantage of a shunt regulator is that no power is dissipated unless there is excess power that you can't use. Of course, this regulator did nothing to keep the battery from being overcharged, so I had to watch its voltage carefully.

The PROPER way to build a solar power regulator is to use the technique that has been standard on AMSAT satellites for the past 20 years or so. You build what is essentially a switching power regulator, except that it has two sense inputs. One is connected to the output and behaves like an ordinary power supply, cutting off the oscillator when the voltage rises above a certain set point. The other sense input behaves in reverse, cutting off the oscillator when the array input voltage falls below its setpoint. The two sense circuits are ANDed, that is, the input has to be above its setpoint and the output below its setpoint for the oscillator to run.

The big advantage of this type of regulator is efficiency -- the regulator itself has the efficiency advantages of a switching regulator, and the ability to operate the solar array at a specified voltage allows you to suck the maximum amount of power out of it. This threshold needs to be adjustable, since the optimum power point is a function of loading and especially of array temperature. The later satellites do it by measuring the array temperature with thermistors and setting the array operating points according to a lookup table in the onboard computer software.

[I've re-ordered the points he made to rebut in a more logical order]

In article <7880084@hpfcdc.HP.COM>, perry@hpfcdc.HP.COM (Perry Scott) writes:
> I've only participated in one field day. As an outsider, it seemed
> strange that field day was:
> o you get points for putting out marginal signal (sorry QRPers) that
> hardly anyone can hear.
If you are running from a 2KW generator, you can run one 1KW station or
10 100W stations. When your generator runs out of gas, solar power will
let you run a QRP station--period. If you can't communicate with one tube
tied behind your back, how are you going to manage when Nature ties it there
for you?

> o home stations are frowned upon. (In a real emergency, we all run to
> the nearest mountaintop, where the emergency isn't ?)

Many classes of emergencies happen away from populated areas (forest fires,
plane crashes, etc.). Knowing how to set up a field station is valuable.
Moreover, consider the damage from Hugo (or the REAL "big one" when it
finally hits San Francisco) -- there may not *be* any homes left to have
a nice, cozy station in.

> o the antenna systems and radios are usually commercially-made.
> (real hams roll their own stuff, right ?)

Perhaps Field Day needs a new category for radios soldered together out of
junk television parts the morning of Field Day (I'm not quite kidding).
However, for emergency preparedness, simply having spare radios in a safe
corner of the local ham club is more likely to be a winner than secreting
broken TV sets around the local area... :-) (Note that one antenna
I used during a Field Day was a 1000' chunk of wire thrown down the
side of the mountaintop we were at. It may not have been the most
efficient possible antenna, but it worked *real* well. I suppose the
WIRE was commercially-made, but...)
>
> o done in the summer. (no emergencies happen in the winter, right ?)
> o the exact start and stop time are known. (planned emergencies ?)

Hey, real disaster-relief agencies plan their simulations ahead of time!
(Ah, I remember the time someone got up at the BEARS club and announced
"There will be a disaster at the beginning of next month...") However,
there has been a proposal kicking around rec.ham-radio for a spontaneous
Field-Day-like thing, which might be a very interesting idea.

> o more social event than communications (we hams do like to yak...)

What, you should get an extra multiplier if you didn't enjoy yourself? Most hams do it because it IS a fun hobby -- the ability to be useful once in a while is gravy.

Field Day is not a carefully designed emergency preparedness exercise. However, when a disaster does hit, a lot of FD operators will be able to think "Well, gee, now what do I do?", and somewhere, in the dim dark recesses of their brains, the training Field Day and other contests gives them will nudge forward and help out.

3518. Re: When do you use this? (was Re: KENW

Message-ID: <30500254@ux1.cso.uiuc.edu>
Source record: 16031

One of the things that many (if not most or all) cross-band repeater functions of dual-band radios cannot do is make the repeater function appear split. In other words, the radio will listen on say: 146.520 and 446.000 and when a signal comes in on 146.520 it will only retransmit it on 446.000. You cannot make it transmit on some other frequency than the frequency it is listening on when in repeater mode.

Some radios may well be capable of doing that, but I have not heard of any specifically. If someone knows of one, please post the information. Such as radio could be programed to, for instance, listen on 146.34 and 444.500 and when a signal comes in, retransmit on 146.94 OR 449.500 (on the other band). I don't know if this capability is particularly needed. If you know of a case that it is, I'd like to hear about it.

Source record: 16048

James Washer asked if there was a way of finding out about ham calls before they arrive from the FCC.

You might try calling 312-234-8011, with modem set for 1200 bps and 8 bits, 1 stop bit and VT-102 emulation. This is a free service from the Callbook that lists any new or updated info that is not in the current Callbook or Callbook Supplement.

The info is only put in a couple of times per month, so it may be possible to receive a license before it appears here.

It is useful for QSLing someone who is not yet in the book, or who has changed addresses and the current book doesn't show it yet.

3520. Re: PL259 connector assembly

Newsgroup: rec.ham-radio
Date: 1989-10-26 01:01:31 UTC
From: dml@esl.com
Message-ID: <DML.89Oct25180131@chopin.esl.com>
Source record: 16050

There was a series in Hints and Kinks in QST a year or so ago on this very subject.

The keys I've seen missed in this discussion are:
Use a BIG soldering iron (100W or so). That gets the connector heated up without taking so long that the cable melts.

PL259's are not intended to be re-used. You can get them cheap enough that is really isn't worth the trouble. (Obviously this means going to hamfests, flea markets, surplus stores/catalogs etc. But you should be able to get a PL259 for under a dollar. Why fool around with re-using it at that price? Just cut the sucker off and start over.)

BID: RTDX2010

RTTY DX Notes For Week Ending 20th October 1989 (BID RTDX2010)

First may we commiserate with those people in the W6 area who have been
affected by the recent earthquake. We hope that the devastation caused
has not been of a personal nature. From reports received it would appear
that at least some of our DX friends were lucky to escape with very minor
damage. In hind sight it was noticed that from 2130Z on the particular
day until after 0245Z the bands went very dead. Before and after they
appeared to be normal, but at that specific time there was a very dead
period. One wonders if there could be some connection?

Our thanks this week go to the following stations: G3XTL, I5FLN, JA1BLV,
OD5NG, OH2BGD, TG9VT, VE3JPC, VK2EG, W0LHS, W1DA, N2HOS, W2JGR, AND
W6/G0AZT. Thanks chaps for your interest and help.

No information received, and the bands were dead in this area.

QSL Information.

KU9C is QSL manager for TE2M, TI2YO, 8P6QA, 8P6RY. TE2M is the contest call for TI2YP. KU9C operated from XX9SW in a recent contest.

ZK1RS, Bob, says to QSL via ZL4DO.

6W1FJ confirms that his QSL manager is F6CBL.

HL1SX wants his cards via Box 162, 10-601 Seoul, Korea.

VY1CM (Zone 1) will QSL via 13 Sunset Drive North, Whitehorse, Yukon Territory, Canada Y1A 4M7.

SV0GB will QSL via DL3MCT.
6Y5HN, Nigel, via Box 135, Kingston 15, Jamaica.

5V7DP QSLs via KA1DE.

TI100D is a special event station celebrating 100 years of democracy and will QSL via TI4SU.

J73EH QSL manager is WA4WIP.

YS1MAE will QSL via Box 691, San Salvador, El Salvador.

TR8AHO says to QSL via DJ2VZ.

5H1HK will QSL via JH4RHF.

UW3TT/UH4H via Box 96, Gorky 603000 USSR.

UB5IPU QSL to Box 6569 Donetsk 340121 USSR.

UA6CQ QSL to Box 114, Krasnodar, 350000 USSR.

Notes of Interest.

At the time of writing these notes there has been no sign of the A61 operation, nor is there any signal from 5A.

EA9JV reports that he is still trying for operation in mid November from Western Sahara (S0).

AA5AU and W6/G0AZT will be active from C6A (Bahamas) from October 25TH through November 1.
OH2BGD is at present in Singapore. He hopes to be QRV from 3D2 from October 22nd to 25th, then A35 from October 26th to November 1st. From 5W1, where he is not sure of activity as yet, he will go to ZK3 if he can find a boat going there from November 4th to the 14th. The team will consist of OH1RY, OH2VB, OH2BGD, SM7PKK and one JA.

Please note that the S92LB operation has been advanced one week. DJ6JC, Walter, will arrive in Sao Tome Monday at 0930 UTC. He will spend the week instructing Luiz on the operation of the Tono 7000E and will be on the air during the week. He will then leave Sao Tome on Monday the 30th to return home. He will leave at approximately 0930 UTC. Hope that you can find him.

GL DE DX1.

o FCC to Consider Ham Restructuring

The FCC's Private Radio Bureau forwarded twelve Petitions for Rule Making to the Office of the Secretary with instructions that they be assigned Rule Making numbers. These twelve petitions contain various proposals for restructuring either the classes of operator licenses in the Amateur Radio Service or the qualifying requirements for such licenses or both.

On September 14th, the FCC Secretary's office circulated a Public Notice (Report No. 1974) entitled "Petitions for Rulemaking Filed" asking the public whether the Commission should further proceed towards amateur restructuring. The assigning of RM file numbers and the circulation of a Public Notice is the important first step toward an anticipated Notice of Proposed Rule Making (NPRM).

Interested parties should now file a statement in support of or in opposition to further consideration of this issue. If it is decided that the petitions have merit, the bureau chief's staff will prepare a draft of an NPRM for review by the Commissioners. The bureau chief in this case is Ralph Haller, also an Extra Class amateur, N4RH. He is well versed in amateur affairs having spent a good deal of his government career as an FCC engineer out in the field.

If the Commissioners agree with their staff's appraisal, then a docket number will be assigned and the NPRM will be released to the public for comment. The Notice of Proposed Rule Making will set forth a description of the issues involved and will propose new rules. There undoubtedly will also be questions on which the FCC will ask for detailed observations. It is at this stage (and ONLY at this stage) that further specific recommendations should be made by interested persons. Thus the NPRM is really the beginning of the public debate. We are not yet at this bargaining point and it is inappropriate to file specific counter proposals at this time.

What to Do Now!

The FCC is now looking for a show of support (or opposition) to their going forward on the proposals to restructure the Amateur Radio Service to include a code-free license. You and/or your ham club should file a declaration with the FCC as follows:

Before the
Federal Communications Commission
Washington, DC 20554

In the Matter of)
)
A Class of Operator License)
In the Amateur Radio Service) RM 6984 through 6995
That Does Not Require a)
Demonstration of Proficiency)
in Morse Telegraphy)

DECLARATION OF SUPPORT (or OPPOSITION)

On September 14, the Federal Communications Commission gave public notice of the filing of RM-6984 through 6995, Petitions for Rule Making. These petitions contain various proposals for restructuring either the classes of operator licenses in the Amateur Radio service or the qualifying requirements for such licenses or both.

We believe that continued growth in the Amateur Radio Service would be promoted (hindered) by the modification or creation of a class of operator license that does not require a demonstration of Morse code proficiency as a qualifying element. To the extent that the captioned petitions propose such an Amateur Radio operator licesne, we submit this declaration of support (or opposition), pursuant to Section 1.405(a) of the Commission's Rules.

Signed: _____

Include your name/call sign/address/date - and club affiliation if applicable. You may also include a short - not to exceed one paragraph - stated as to why you feel the petitions should be further considered. Again, the time to get into a debate on the details is at the NPRM stage. All you are indicating now is that the petitions should go forth and a Notice of Proposed Rule Making issued. The FCC must receive your declaraction on/before October 14.

o Red Cross Sends Hams to Caribbean

We interviewed Mike Riley/KX1B, who directs all radio communications for the American Red Cross (ARC) in Washington. Riley was visiting with Red Cross chapters in Ohio, gathering information for the Red Cross Communicator Training Guide when ARC HQ called him back abruptly to help with the hurricane Hugo emergency.

"We experienced a massive communications problem" when telephone service in the islands was cut off, Rile told us. "We dispatched ARC volunteer hams fro Dayton and Erie (Pa) to the Caribbean. They are in San Juan, PR now and will be deployed shortly to the other islands: two to St. Thomas, two to St. Croix and one to stay in San Juan. We also sent an individual to Antigua. In addition to a Kenwood TS-440, he has a satellite station operating through the INMARSAT system and the ATS-3 Applications Technology Satellite."

"The purpose of this team is to provide emergency and priority communications out of the affected ares to the ARC. No Disaster

Welfare inquiry information is being handled at this time, as there is a nationwide moratorium on acceptance of such traffic. We simply don't have the resources to handle welfare inquiries. It's impossible to say when the moratorium will be lifted."

"The FCC has granted us Special Temporary Authority (STA) to operate on a frequency outside the 20 m band. The STA may be terminated at 2359 Oct. 5 or prior to that date if appropriate."

KX1B emphasized that it is not an Amateur Service frequency and is not available to amateurs not associated with the ARC net. The ARC is supplying the FCC with all of the callsigns of stations authorized in the STA operation so that Commission monitors can quickly identify violators.

"We are working closely with the ARRL. There are about 12 stations on our initial authorization list, including W1AW, W1INF (ARRL HQ Club Station), KI4T in Florida (chairman of ARRL Emergency Communications Advisory Committee) and W4HFH at the Alexandria (Va.) Red Cross." W4HFH, operated by the Alexandria Radio Club, has been the ARC HQ's representative to the various HF nets operating through the emergency on 14.313 and 14.303 MHz.

The ARC National HQ station is still under construction. Currently it is using a Yaesu 747. Several manufacturers have agreed to donated ham gear to the project. ICOM is delivering IC-781 and IC-765 HF transceivers. Butternut Electronics and MFJ will also donate equipment.

>-Well, I think that there is one over tho horizon radar site in the USA too..

I toured Grand Forks Air Force Base outside Grand Forks, North Dakota, over the summer, and they told us that a top priority project is building an over-the-horizon radar system. I don't know anything about the status of the construction (i.e. just dreaming or actually building) or about the specifications or capabilities, I was just on an unclassified tour when they mentioned it.

3528. Madison Electronics

Newsgroup: rec.ham-radio
Date: 1989-10-26 11:37:07 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <8910280710.AA12826@ucbvax.Berkeley.EDU>
Source record: 16047

The question about Madison Electronics in Houston reminds me of a slightly amazing thing that happened to me there, long ago. Max, the owner (SK?), answered a question for me regarding biasing 813s. The entire exchange lasted less than three minutes. He didn't know me, young high school punk. I returned to Madison's FOUR years later (not having been there in between), and he instantly recognized me and asked about the 813 amplifier. What a memory.

>instructs the pilot to turn onto heading 240 degrees and follow the
>signal from the MYSTIC VOR to the VOR. When he gets there, he will
>either receive further instructions or follow his flight plan. VOR's
>were one of the earliest NAVAIDS.

Yes, but there was a couple of earlier things. One was the
beacon system that used a narrow beam. One side of the beam you
heard dashes, and the other side dots.

One other navaid is the NDB. It is a non-directional beacon transmitting
in the AM band (up to 600 or so Khz). The aircraft has a loop-sense antenna
that points to the station. The receiver in the aircraft is called and ADF
and can also be used to pick up standard AM commercial broadcasts. Great
for listening when you don't have to talk to ATC

Actually, the VOR transmiitter has a rotating beacon that rotates through
360 degrees and somehow encodes the bearing into the signal. The receiver
in the aircraft decodes this and indicates through the OBS (Omni-bearing
selector) indicator how far left or right of the selected radial you are.

The drawback to VORs is that the closer you are to the station, the
more sensitive the signal is, since the length of arc between any two
angles is shorter closer in than farther out.

There are also 2 classes of VORs: Primary and secondary. Primary
VORS are generally used to define the Victor Airways (low altitude) and
jet airways (high altitude). Secondary VORs are generally used as
part of an instrument approach. Something like:

"Cessna 737zz, proceed direct Midwest VOR, cleared for VOR-Alpha approach Greene County". What this means is that the pilot is cleared to the Midwest VOR, and then can execute the VOR-ALpha approach into the Greene County airport (it happens to be on the 334 deg radial, 18.5NM DME from the VOR).

>ILS - Instrument Landing System. System uses radio signals (I don't >know what frequency, I think microwave) to generate a glide slope signal >to landing aircraft. This allows a pilot to land an aircraft safely in >marginal conditions. Most airliners use ILS even in clear weather >because it's actually easier. The pilot just follows an indicator in >the cockpit which indicates if his rate and angle of descent are >correct. If you want to hear irritated pilots, catch your airfield with >it's prime runway's ILS down! :-). Approach control will handle the >aircraft until it reaches the "outer marker" of the ILS. This is the >first indication received from the ILS. Generally approach will tell >the aircraft to contact the tower at that point with "TWA 424, contact >the tower 120.3 at the outer marker."

Actually, the ILS uses the same radios and indicators as a VOR, just that the ILS provides both glideslope and azimuth indications. It is in the same band as the ILS (the lower part of the nav frequencies are for landing aids, the upper part for VORS).

The ILS generally uses the number 1 OBS and has an extra indicator to indicate glide slope.

There are some variations on the ILS. One is the Localizer only where only azimuth information is given. Also something that can occur is the glideslope-only approach (generally with the localizer is out). One of the more interesting approaches is the localizer back-course approach. It is the same as a straight localizer approach, the the needle sensing in the cockpit is reversed.

Around Dayton, I have never flown an ILS from the IAP (intial approach point), but have had "N737ZZ, expect vectors for ILS 24 RIGHT". You will then be vectored about to a point where the approach controller can fit you into the flow of traffic. Then at the outer marker (generally another NDB), you can expect "N737ZZ, contact Tower 119.1".

>DME - Distance Measuring Equipment. Related to VOR. Gives a dead >reckoning distance to the NAVAID generating the signal. An optional >addition to VOR's. Useful with a busy VOR or a remote one. If you have >VOR and DME in your plane (not all do, it's not required) it's really >difficult to get lost. Also nice when setting up for an approach.

Not all VORs have DME capability. The DME in the aircraft sends a signal to the DME at the VOR, and then it replies back. By timing these signals the DME in the aircraft can give a distance reading, compute groundspeed, and give an estimated time of arrival. You are right, it is great for an approach.

Try calling Plessey at 312-953-1484 or 408-438-2900. As far as
distributors, I had to call them last time I was looking for
some ICs from them, and they seem to change distributors often.

3532. Need Help/Schematic with Kenwood MC-46 Microphone

Newsgroup: rec.ham-radio
Date: 1989-10-26 15:54:57 UTC
From: jim@ghp.UUCP
Message-ID: <451@ghp.UUCP>
Source record: 16052

I just bought a 2 metre Kenwood from a friend. Part of the deal was an MC-46 microphone, this one has a pre-amp and touch tone pad. Although it was working, now the voice half of things no longer works (i.e., I can get tones out, but nobody can hear my voice). My first guess is in the pre-amp.

Although the pre-amp is small, a schematic would be very helpful (the transistors have stange markings of course). I have the service manual for the rig, but it doesn't have anything for this mic.

Can anybody help me out, either with suggestions or the schematic?

tnx

3533. Need help with BC200-XLT problem

Newsgroup: rec.ham-radio
Date: 1989-10-26 15:58:00 UTC
From: STEVE$@S57.Prime.COM
Message-ID: <386400006@S57.Prime.COM>
Source record: 16069

I was wondering if any other BC200-XLT owners have encountered a problem with low-battery shutoff. Finally after 6 months of unsatisfactory battery life (approximately 4 hours depending on audio output) I decided to measure the current drain of the scanner under various conditions (frequency, back light, audio output) AND the low-battery threshold.

To my surprise, what I found was that the NiCads (rated at 1.2v * 6 cells = 7.2v), which using the supplied charger/adapter topped off at over 8 volts, were entering low battery state at about 7.4 volts. Low battery state causes the low-battery indicator to flash and sets a timer which powers down the scanner after about 11 minutes. Turning the scanner off and on leaves you in low-battery state, but gives the scanner another 11 minutes before it powers down again. I figure I could get another 3 to 4 hours if I didn't mind resetting the scanner every 11 minutes.

My though is that 7.4v is way to high a threshold for low-battery state. I think that 6.5v (one volt per cell plus safety margin) would be sufficient to give the scanner another 2 to 3 hours of operation. Does anyone else have any thoughts on the matter or any suggestions on how to make this modification?

Thanks in advance,

Steve Meserve N1FZA

3534. Re: Neutralizing Heathkit finals (6146/A/B woes)

Newsgroup: rec.ham-radio
Date: 1989-10-26 16:23:31 UTC

Message-ID: <679@suntops.Tops.Sun.COM>
Source record: 16061

How about the old fashioned method of removing hv and screen voltage leaving the filaments on if I remember correctly, applying drive and dipping the output as detected on a sensitive relative power meter? The object here to neutralize the interelectrode capacitance of the tube with a variable and equal parrellel capacity. Start on 80 meters and work your way up to 10, 10 being the most critical. Also please do be carefull with the dangling plate and screen leads.

3535. Re: Looking for comments on ham demos

Newsgroup: rec.ham-radio

>demo someone in that situation might like: VHF or HF? Fancy stuff
>like autodialers, or ordinary chitchat? DXing or stateside?
> ...

A very important question! Kids (the future of ham radio) are darned
hard to impress!

Fifteen years ago it was easier; demonstrate satellite communication,
autopatch, lasers. Today every hillbilly has a satellite dish, every
yuppie has a cellular phone, and every grocery store has lasers. A
portable packet rig _might_ be good, but lots of kids are already BBS
wizards.

Kids adapt to `high tech' faster than adults, but can be intimidated
if they feel that understanding of such things is unattainable, so not
worth attempting. Their defensive reaction is often "Big deal; so
what?" They are certainly unimpressed by anything which they feel
their parents' generation dominates and has exhausted all the
possibilities. (I don't blame them for sneering at typical ham
appliance-operator activities!) On the other hand, they are
fascinated by opportunities to gain knowledge their parents lack,
which by definition gives them more control over their environment
(which they desperately desire). I've seen their faces light up when
they comprehend basic electricity, or what a transistor does, and
realize the power of that knowledge.

After having my beloved ham gear disparaged by the little twerps, I
discovered that a low-end approach to electronics is much more
successful. Variations on the following demonstrations have been
well-received by brighter-than-average kids aged 10-14:

1. Remember that they probably don't understand how a flashlight
works. Demonstrate electric shock: Connect a few 9v batteries in
series, enough to feel with wet fingers. Use kids holding hands to
demonstrate series circuits. Demonstrate again using battery,
lightbulb and switch. Let them play with it for a while.

2. Keep their interest by skipping the rest of the basics for now.
They love visual demonstrations: Show them how an oscilloscope works
like an "Etch-a-Sketch" (tm), then connect a flashlight cell to show

how it reacts to voltage. Next, connect an oscillator (also connected to a speaker) to the scope. Starting at 1 Hz, show how the scope makes a graph and how frequency, wavelength and pitch are related. Then connect a microphone to the scope; whistle and talk into it. Pause to let them explore the mysterious scope knobs. (Oscilloscopes are _cool_; every mad scientist has one in his laBORatory! :-)

2. Connect a silicon photocell to the oscilloscope; demonstrate its response to a flashlight and to 60-Hz fluorescents. Then connect it to a transistor (which you salvage from an old p-c board). Connect the scope to the collector. Substitute a relay or lightbulb for the collector resistor. ("You now know how to build an intrusion detector for your room...")

3. Using the same transistor, connect a crystal set to the input, thereby building a radio from scratch. When I saw that done at age 10, I was profoundly impressed; I had a wonderful feeling that maybe the world is still young and that electronics might be within my capabilities. The gain of self esteem was priceless. My electronics career started there. (BTW, the crystal set in the Boy Scouts' Handbook does not work because the sliding coil-tap shorts turns.)

4. Demonstrate telephones built from earphones, batteries, speakers, etc. Provide enough supplies for the kids to build their own. Suggest that they start their own neighborhood phone company. Mention that they could have some real fun by connecting an amplifier to the system.

5. Explain that ham radio is a fun, easy way to learn electronics. THEN demonstrate ham radio's capabilities. Distribute books on basic electricity, and electronic junk to dismantle for parts.

A local chemistry prof who is a scoutmaster has "junk night" for his troop once a year; he collects discarded electromechanical devices, then provides tools and lets the scouts wreck the stuff and keep the interesting and useful components (magnets, lenses, etc.) Junk night is held in a lab which contains oscilloscopes, meters, etc. Selected local hams are invited to help and supervise. It's great fun for everybody.

Hams in the San Francisco area apparently did a great job! I hope they get proper recognition. How did the cellular phone system perform during the earthquake emergency? In many big cities, it is barely adequate to handle normal rush-hour traffic. Did cell sites in SF stay on the air with emergency power? Did the yuppies save the day with their portable phones, or did high tech let them down?

> to landing aircraft.

The ILS is a combination of two transmitters in the VHF band (108 to about 118MHZ). One is positioned a the far end of the runway and is called the localizer. It is used to tell if the aircraft is right or left of the course to the runway.

The second transmitter, called the glide slope, is positioned along side the runway at the point where the aircraft is to touch down. It is used to tell if the aircraft is above or below the proper glide path to the touchdown zone.

Together, the ILS provides a 3-deminsional precision approach to the runway. The marker beacons are separate low power transmitters used to mark specific points along the ILS approach.

>
> DME - Distance Measuring Equipment. Related to VOR. Gives a dead
> reckoning distance to the NAVAID generating the signal.

I beleive the DME uses an active interrogation by the aircraft DME transmitter of the DME system that is co-located at some VORs. By timing the response, the airborne system calculates the distance to the station. This is a measured distance and not a dead reckoning position. Note that when directly overhead the station, the DME will still show the distance (ie the altitude) to the station. I think the DME operates somewhere around 1Ghz (the antenna is about 2 inches long).

3543. KENWOOD TH-75A MOD

Newsgroup: rec.ham-radio
Date: 1989-10-26 20:19:00 UTC
From: SKAGOO@MEMSTVX1.BITNET
Message-ID: <8910270722.AA26441@ucbvax.Berkeley.EDU>
Source record: 15983

```
TH-75A MARS/CAP MODIFICATION
----------------------------

This modification will allow the TH-75A to transmit from 142 to 152 MHz and 420
to 450 MHz. Specifications are guaranteed for the Amateur Bands only. Through
the transceiver will display 136 to 174 MHz and 335 to 512 MHz, the PLL circuit
may not lock through the entire range.

CAUTION
-------

Protect your license. Make sure that you operate on authorized frequencies
only.

MODIFICATION PROCEDURE
----------------------

1. Disconnect the battery and antenna.

2. Remove the three case screws and two battery plate screws.

3. Lift the front panel from the body of the transceiver, but do not
disconnect the two flex cables.

4. Cut the green jumper wire (W1) that is located to the left side of
the CPU in the front panel assembly.

5. Assemble the transceiver by reversing steps 1-3.

6. Reset the CPU by holding the M key as the power is turned on.

I have tried it and it works.

Combining the ideas of the previous posters, a temporary
repeater (mobile if need be) coulb be nmake using the cross
band repeater features of today's fancy equipment.
I (and a few others) have made the cross band mod to my Kenwood 721.
It would be very easy to park two mobiles on a hill top about a
few hundred feet apart and make a complete repeater system.
Utilized in this manner it(they) would be able to handle inputs
from both bands and output to both bands. This seems like a great
thing to do in an emergency when the AC power dies.
Also it would allow a whole county coverage with mulitple cross
band repeaters with the users on one band and the interlink on the
other.
Just a few ramblings (IMHO)...

3547. pre-novice seeking equipment advice

Newsgroup: rec.ham-radio
Date: 1989-10-26 21:11:57 UTC
From: mahling@cs.umass.edu
Message-ID: <6004@dime.cs.umass.edu>
Source record: 15977

I am seeking some advice from the net about equipment in
general.
I am currently studying for my novice exam. I am also finishing
my dissertation in CS so I have little time to visit clubs etc.
Just enough time to squeeze in some code practice between
research and writing diss.

There are various sources that say one should start out with an
"economy" transceiver (I guess this means the low end Kenwood,
Yaesu, Icom HF transceivers, CB, SSB, etc. mode, 160 to 10 m,
100 or 200 W PEP),
even though novice priviliges dont allow
one to use it all the features immediately. Buying such a thing
would give immediate success which is important for a novice.
They are also useful when upgrading.

On the other hand I do like to tinker and build my own
equipment. I could not find a kit or something like that for a
so called economy transceiver. The only thing is a QRP kit from
Heath which definitely does not fall in the above category.

Are there other kits or sets? Should one start with QRP
anyways? Is it best to initially forget about building yourself
and buying something solid? I'm quite confused.

Thanks for your help,

Dirk Mahling

>[stuff deleted...]
>Does anyone know where a reasonable kit can be purchased?

The Radio Shack kit is, actually, acceptable. I got one for Christmas when I was nine years old, and it was quite thrilling. To this day, I still have it, and it still works. Only thing you might consider adding on to the kit is a longer antenna. They only provide 10 feet of wire for the antenna, and 10 feet for the ground (at least, when I got mine). It was kind of disheartening at first, because the short antenna did not give enough signal strength to pick up any stations at first, and I was afraid it didn't work. So, my advice is just stick with the Radio Shack kit and buy some antenna wire to go with it, and your nephew should be quite happy.

3550. Phone Patch Construction question

Newsgroup: rec.ham-radio
Date: 1989-10-26 22:29:50 UTC
From: SKOHC@CUNYVM.CUNY.EDU
Message-ID: <8910280711.AA13193@ucbvax.Berkeley.EDU>
Source record: 16065

Greetings,

If this msg has already reached the news group, please excuse.

I wonder if someone would take a moment and answer some not state-of-
the-art questions. I am thinking about setting up a private phone
patch on 2 meters. It would cover only about a 2 mile radius.

My first question concerns the legality and accpetability of this.
Of course, I would make certain the freq is not used by a repeater,
or packet or any other group.

Secondly, how cheaply can this be done. I have a rig at home and an
old yaesu phone patch (model ll 301). I assume I would hook up a vox
circuit on either the tel line or the radio line, but I wonder if it
poses a problem because it will be simplex. I was thinking about getting
a subaudible tone decoder for the home station. Also, would I need a tone
burst detector unit for control of various functions?

As you can see, I don't have much experience with this sort of thing.
Any suggestions and comments would be appreciated.

>360 degrees and somehow encodes the bearing into the signal. The receiver
>in the aircraft decodes this and indicates through the OBS (Omni-bearing
>selector) indicator how far left or right of the selected radial you are.

The VOR transmitter sends two pieces of information on a single carrier.
A reference signal of I believe 30Hz is amplitude modulated on the carrier,
and another AM signal in the 9000 Hz range is frequency modulated at
the same 30Hz. The phase angle of the 30Hz "FM" signal is varied as the
antenna array is electronically rotated. Thus the azimuth from the VOR
can be determined by comparing the phase angle of the two 30 Hz signals.
(This is from memory so the actual numbers may not be 30Hz and 9000Hz.)
>
>Actually, the ILS uses the same radios and indicators as a VOR, just that
>the ILS provides both glideslope and azimuth indications. It is in the
>same band as the ILS (the lower part of the nav frequencies are for
>landing aids, the upper part for VORS).
>
Actually the ILS consists of many components, the Localizer which provides
an artificial runway centerline and a Glideslope which provides an
artificial glideslope angle (similar to the VASI's for VFR). The marker
beacons indicate position along the ILS and the various light systems
provide for the transition to visual flight before touchdown. The
localizer component uses the same radio as the VOR but the method of
encoding the information is different. In fact the localizer and
glideslope transmitters use the same method of encoding the information.
The glideslope transmitter operates in the 300Mhz range, the VOR and
localizer operate in the 108 - 118Mhz range. The channel selected on
the VOR/localizer receiver determines the frequency used by the
glideslope receiver. (i.e. they are paired.) The marker beacon transmitters
are at 75Mhz single frequency but the Inner Marker, Middle Marker and
Outer Marker signals are tone modulated differently and therefore will
light different lights on the display.

>
>Not all VORs have DME capability. The DME in the aircraft sends a signal
>to the DME at the VOR, and then it replies back. By timing these signals
>the DME in the aircraft can give a distance reading, compute groundspeed,
>and give an estimated time of arrival. You are right, it is great for an
>approach.
>

A DME is usually associated with TACAN (Tactical Air Navigation). This is the military version of NAVAIDS. The VOR is then called a VORTAC. If the DME is simply colocated with a VOR then it is called a VOR-DME, these are indicated by different symbols on the charts. The DME works very much like a transponder but with the roles of interogator and transponder reversed. These systems are single frequency(no channel selection to make) UHF pulse systems. In the case of a transponder, a device which allows the ground based radar systems to get a strong reply from an aircraft, the pulse train which is returned to the interrogator has information encoded in it. If the interrogator sends a Mode A interrogation the transponder replies with its SQUAWK a four octal digit number which is dialed into the front of the unit. If the interrogator send a Mode C interrogation then the transponder replies with its altitude as determined by an encoding altimeter. This information is usually presented to the controller in the data block which tracks an aircraft on the radar display. The SQUAWK codes are usually assigned by ATC and have specific meanings.

For those interested - The OTH-B Over The Horizon Backscatter radar on the east coast is operational with about 180 degrees of coverage. A west coast system is nearing completion. The final site in the Dakotas will look south 180 degrees. North looking has been a problem due to the Northern lights and otherwise poor propogation. These HF radars use the Ionosphere to bounce the radar pulses in vertical and horizontal sweep. They are very long range and have no short range capability (say inside 200 miles). There are also many portable systems in use by the Navy, while the USAF is only interested in fixed sites. Portable meaning rapidly set up, not small.

Definitely **DO**NOT** do this. An electric shock across the heart (such as would be the case in a chain of kids holding hands) can be **FATAL**.

Limit demonstrations of electric shock to where the electric path does NOT involve the heart or other organs. A wet finger and 2 9v batteries might be OK. You might also try touching the tip of your tongue to a single 9v battery (or lesser voltage from other cells).

Another demonstration you might try is this: take a couple of lantern type batteries in series for 12-24 volts, and attach one end to a tin can with all it's metal exposed. In the other, use a clamp of some sort to hold some thin (30 gauge or so) metal wire. Have a lot of the wire on hand. Touch the wire to the can and see a quick spark and let it fuse to the can. Now the wire will be heating up due to the short and will soon break in the middle after it turns red. Repeat the process in several places on the can and you will soon have a "hairy" can.

```

ARRL LETTER - Volume 8, Number 21- October 24, 1989

AMATEURS KEEP COMMUNICATIONS FLOWING
AFTER SAN FRANCISCO EARTHQUAKE DEVASTATION

An earthquake measuring 6.9 on the Richter scale and several aftershocks during the following days caused widespread damage in the San Francisco Bay area. ARRL Pacific Division Section Managers Bob Vallio, W6RGG, Richard Wilson, K6LRN, Glenn Thomas, WB6W, and other ARRL officials in the affected areas report that local amateur emergency nets on the 2 meter and 220 MHz bands are in full swing providing on site emergency communication assistance via amateur repeaters to public officials and representatives of The American Red Cross. The extensive packet network on 2 meters and 220 MHz in the San Francisco area has been dedicated to handling the heavy volume of Health and Welfare traffic.

Amateurs monitoring HF emergency net frequencies are advised not to transmit except in response to a request for assistance. Priority must be given to immediate emergency relief communications.

National Traffic System officials advise that welfare inquiry traffic may be routed via normal NTS paths. Priority in health and welfare traffic is being given to messages originating from the affected areas. Amateurs should advise the public to attempt normal telephone service first before initiating an inquiry via Amateur Radio. Messages should contain complete address and phone number.

SENATE ADOPTS BUDGET RECONCILIATION BILL WITH AMATEUR LICENSE FEES,
BUT THE BATTLE'S NOT OVER

On Friday, October 13, S. 1750, a stripped down version of the House of Representatives Omnibus Budget Reconciliation Act of 1989 (H.R. 3299) was adopted by the Senate by a vote of 87 to 7. Senate leadership on both sides of the aisle blocked the introduction of any amendments to their version of the budget reconciliation bill. As it stands, S. 1750 includes fees for Amateur Radio licenses.

Now the good news. Senator Carl Levin of Michigan made a strong statement on the floor on behalf of amateurs. He said he had intended to introduce an amendment exempting amateur licenses from fees with Senators Symms of Idaho and Lieberman and Dodd of Connecticut, but that in view of the resistance to any amendments, he would not do so. The amendment he would have

introduced would strike what he called "a new tax on Amateur Radio operators." Senator Levin said he did not believe the framers of the bill had intended to levy a new tax on Amateur Radio volunteers, and had confirmed this with Senator Hollings of South Carolina, Chairman of the Commerce Committee.

Senator Danforth of Missouri, the ranking minority member of the Commerce Committee agreed, and said that the Committee had managed to exceed its instructions on budget reconciliation and would work with Senator Levin to drop the matter of amateur fees from the legislation in the conference committee.

PRB-1 HELPS IN COSTA MESA ORDINANCE

Attention Costa Mesa amateurs: The City of Costa Mesa, California recently adopted an ordinance setting forth procedures and regulations for Amateur Radio antennas. The ordinance was developed with input from a number of hams including ARRL Director Fried Heyn, WA6WZO, Vice Director Wayne Overbeck, N6NB, and Assistant Director Art Goddard, W6XD.

The new Costa Mesa ordinance recognizes the fact that PRB-1 preempts state and local zoning regulations which seek to preclude Amateur Radio communications. It did note that regulations based on health, safety or aesthetics must represent a reasonable accommodation for Amateur Radio communications and must constitute the minimum practicable regulation necessary to carry out the local agency's legitimate purpose.

All antennas and towers erected in the City of Costa Mesa prior to September 6, 1989 have until May 7, 1990 to be registed so that they will be grandfathered. Antennas erected after September 6, 1989 fall into three categories: 1) Roof mounted antennas require no permit at all; 2) Antennas and towers under 30 feet require a permit, but there is no limit on the number of antennas; 3) antennas and towers over 30 feet require a permit and can be no higher than 75 feet with a maximum of two towers. There is no limit on the number of antennas under 30 feet.

The amateurs involved in getting the ordinance rewritten learned several things: Use PRB-1--it's an excellent tool, be prepared, know your facts and most of all, be observant.

DEPARTMENT OF JUSTICE FILES COURT PETITION SUPPORTING AMATEUR VIEW OF 87-14

Acting on behalf of the National Communications System, the Department of Justice has filed a petition in the US Court of Appeals for the DC Circuit requesting that the Court review the FCC decision in Docket 87-14 which denied reconsideration of the 220 MHz reallocation decision. The petition seeks review on the grounds that the FCC action was arbitrary, capricious and an abuse of discretion. It requests that the action be set aside and and the matterr remanded to the FCC. We will be hearing more of the ARRL suit in the future.

DUTCH HAMS CELEBRATE 60 YEARS OF AMATEUR RADIO

In August 1929, the first Amateur Radio license was issued in The Netherlands. To honor this event the Dutch Amateur Radio organization VERON received permission from the Dutch PTT to use special callsign prefixes for 60 days beginning October 1 and ending November 29. The special prefixes include the number 6 in front of the usual radio district number. (For example, PA0 becomes PA60)

To stimulate contact with the Netherlands during this period, VERON is issuing a special certificate. US amateurs can qualify to receive the certificate by working 15 Dutch amateur stations using the special prefix. QSL cards or an extract from your log signed by 2 other amateurs is sufficient to obtain the certificate. Send to J. Lourens, PA0BN, Keerweer 13, NL-6862, CD Oosterbeek, The Netherlands. The deadline is March 31, 1990.

NEW CANADIAN CALL PREFIX: VY2

Effective October 30, new amateurs on Prince Edward Island will be issued callsigns with the prefix VY2. Present amateurs on Prince Edward Island will have the option of retaining their VE1 callsigns or, upon request to a DOC District Office, substitute VY2 for the VE1 prefix. New Brunswick and Nova Scotia will remain VE1.

JAPAN'S HAM FAIR '89

The New Hall of the International Trade Center in Harumi, Tokyo was the site of HAM FAIR from August 25-27. HAM FAIR is recognized as one of the largest Amateur Radio events in the world.

Over the 3 day period, the total number of attendees reached approximately 58,000 including 90 people from 14 other countries. Noted guests this year included Dick Baldwin, W1RU, President of IARU, Cheng Ping, BZ1CP, Vice President of CRSA of China, and Wan Xun, BZ1WX, Vice President and Secretary General of CRSA.

8J6JBS OPERATIONS ANTICIPATE LAUNCH OF JAS-1B

The second Japanese amateur satellite, JAS-1B, is scheduled for launch in February, 1990. To commemorate the occasion, the Japan Amateur Radio League (JARL) opened a special station on September 28. The station is located in the Welfare Center of Minami Tane-machi, Nakajinai Minami Tanemachi, Kumagte-gun, Kagoshima Prefecture.

Look for 8J6JBS on all HF frequencies between:

1400-2000 UTC on weekdays
1400-2200 UTC on Saturday
1000-2200 UTC on Sunday and holidays.

8J6JBS will continue operation through the month of February, 1990.

GUEST INTERVIEWS FEATURED ON AO-13 NETS

AMSAT Operations Net Manager Courtney Duncan, N5BF, says that this month, the Operations Net has begun to feature guests from the amateur satellite community.

AMSAT-NA sponsors weekly nets to provide the latest news of the amateur space program. Nets meet Tuesday evenings on 3.840 MHz. The East Coast Net begins at 2100 Eastern time; the Mid- America Net begins at 2100 Central and the Pacific Net begins at 2000 Pacific. On Sunday, AMSAT-NA nets convene at 1900 UTC on 14.282 and 21.280 MHz. There is also a 17 meter net which convenes Sundays at 23:00 UTC on 18.155 MHz.

MACC TAKES ON ADDITIONAL COORDINATION RESPONSIBILITIES

The Mid America Coordination Council, Inc, (MACC) announced that it has accepted the petition of the coordinator for the State of Arkansas as the eleventh state to join its organization.

Other MACC member states include Colorado, Illinois, Iowa, Kansas, Minnesota, Missouri, Nebraska, Oklahoma, South Dakota and Wisconsin MACC claims it is the largest regional organization in amateur radio repeater coordination.

AIRS PROMPTS FCC TO ACT

On August 10, FCC lodged a complaint of harmful interference to the Amateur Service with the Ministry of Posts and Telecommunications, Beijing, China. A station in the vicinity of Hangzhou operating on 14188.5 kHz has been causing interference throughout much of the twenty-meter band. The complaint was prompted by reports from ARRL Interference Reporting System volunteers (AIRS).

In his report to the IARU Region 2 conferees in Orlando last month, ARRL President Larry E. Price, W4RA, said that AIRS "was revitalized recently through recruitment of new, well-qualified and enthusiastic volunteers." Both the quality and the quantity of reporting have improved.

For more information on AIRS, contact Luck Hurder, KY1T, at ARRL HQ.

HANDI-HAM VIDEO AVAILABLE

A new videotape of the Courage HANDI-HAM System is available. The 24 minute VHS format tape details the history, philosophy and services of the Courage HANDI-HAM System.

The video, "Making Contacts--Making Friends, the Courage HANDI-HAM Story," is available to any club or organization wishing to show it by writing Sr. Alverna O'Laughlin at HANDI-HAM Headquarters. In your letter, state the date(s) you want to show the video, the approximate number in the audience, and the name of the group or organization to whom it will be shown. Allow 8 weeks lead time for delivery of the tape.

MO-KAN COUNCIL OF AMATEUR RADIO CLUBS PRESS RELEASE

Following the recommendation of its Board of Directors, the Mo-Kan Council of Amateur Radio Clubs, Inc. approved unanimously to remove itself from repeater frequency coordination activities.

Mo-Kan undertook repeater coordination for the greater Kansas City area over 15 years ago.

Honored in its resolution was Barry Roseman, WA0LHK, who served as Mo-Kan's frequency coordinator during the entire 15 year period.

US ENTERS INTO THIRD PARTY TRAFFIC AGREEMENT
WITH THE FEDERATED STATES OF MICRONESIA

On October 12, the US and the Federated States of Micronesia (V63) entered into an Amateur Radio third-party traffic agreement. This agreement allows radio amateurs in both countries to relay personal messages on behalf of non-amateurs. The agreement also says that if public telecommunications services are not readily available in the event of disaster, communications relating directly to the safety of life or property may be handled by amateur stations in the two countries. Commercial messages or conversations are strictly prohibited under the agreement.

UOSAT-OSCAR-9 QRT

UOSAT-OSCAR-9 became a Silent Key on Friday, October 13, falling out of orbit after eight years, one week and over 45,000 revolutions around the earth. UOSAT-9 was last last heard by ZS6CCD at around 1200 UTC.

UOSAT-9 was launched from Vandenberg Air Force Base on October 6, 1981. During its 8 years in orbit many school children, hams, and space enthusiasts heard its "DIGITALKER" experiment and listened to its telemetry

data.

AMSAT-NA SPACE SYMPOSIUM JUST AROUND THE CORNER

This is a reminder that the 1989 AMSAT Space Symposium and Annual Meeting will be held in Des Moines, IA on November 3-6, 1989.

To register use the registration form on the last page of the Amateur Satellite Report #190. Photocopies are acceptable. Mail the completed form to Ralph Wallio, W0RPK, 1250 Highway G24, Indianola, IA, 50125. If you don't have ASR #190, contact Ralph directly by telephone in the evenings at (515) 961-6406. There is little time left to register, so don't delay.

3559. Dipole antenna genius wanted...

Newsgroup: rec.ham-radio
Date: 1989-10-27 00:42:54 UTC
From: tomas@Apple.COM
Message-ID: <35948@apple.Apple.COM>
Source record: 16075

This past weekend I built a three band dipole antenna for the 40, 30, and 17 meter bands. The antenna is the type with one center and three separate legs, separated by spacers. I tuned the antenna when it was about 5 feet off the ground. The antenna tuned very nicely with low SWR across each band and 1:1 SWR somewhere in the band. Next, I raised the center of the antenna and mounted it near the top of my crank up tower. At this point, the tower was cranked down and the center of the dipole was about 25 feet in the air. Each leg drooped down to about 8 feet in the air. I checked the SWR and found that the 1:1 low point had shifted down in frequency by about 200kHz on the 40 and 30 meter bands (probably expected) and had not changed on 17 meters. After tuning the antenna again to get 1:1 point in the middle of the bands, I cranked up the tower to about 45 feet and raised the ends to about 15 feet. When I checked the SWR, I found that the low point on the 40 and 30 meter bands was no longer 1:1, but about 2:1. Of course, the band edges were at least 3:1 (instead of under 2:1). The SWR on the 17 meter band was still ok. What's the problem? I can understand the SWR low point shifting when the antenna was raised. I can't understand, however, why the SWR low point is no longer low. Can anyone help?

Picture of antenna:

subj: buying equipment cheap overseas
This is in reply to WF2K's question on buying equipment for a good price overseas----
It aint worth it! First off, the dollar is of such low value these days that you can buy the same gear for less at the discount places here in the USA. Second, the warentee is practically useless...it is almost impossible to get service from the stateside dealers on a Japanese bought rig. Third, many of the rigs overseas are not the same as those sold in the states....for example, on their two meter rigs---they go from 144 to 146.oo MHZ...their band is not the same as ours...I found it fun to look around the ham radio electronics district in Tokyo (called Akie ---harbra)...I bought a few odds and ends, but nothing big....also, buy a Japaneese CQ magazine...it's about an inch and a half thick!!! Its hard (for me) to reed Japanese, but fun to look at the pictures!!!
Have fun,
73,

Source record: 15982

I've only got one additional comment to make about soldering on PL259 connectors; do NOT buy crummy Radio Shack connectors and expect to solder them on. Sure, you may say, "I use nothing but Radio Shack connectors, and I've never had a problem." Well, I've been involved in the assembly, installation, and operation of three or four different ham repeaters, and several commercial repeaters. After time, RS connectors have been known to develop "diode junctions" and be the source of much intermod. They'll cause you nothing but headaches over the long run. They may be fine for your mobile rig, but if you are going to use one at a repeater installation, you are asking for trouble. The answer? Spend a little more and buy a silver-plated teflon type connector. The solder flows right onto the case, and you don't need to "scrape" anything. Also, I highly recommend the use of double-shielded cable (such as RG-214). Again, it costs more, but it is easily worth the extra cost.

3562. Cellular Phone via T.V.

Newsgroup: rec.ham-radio
Date: 1989-10-27 07:22:56 UTC
From: nfunamura@NUWES-LLL.NAVY.MIL
Message-ID: <8910270722.AA26463@ucbvax.Berkeley.EDU>
Source record: 15984

1. Background--Cellular phones occupy 824-848 Mhz (mobile) and 869-894 Mhz (base). FM is used and channel spacing is 30 Khz. Mobile/Base spacing is 45 Mhz. These frequency bands were formerly occupied by UHF-TV Channels 72-76 and 80-83+. Shouldn't a TV be able to pick up these signals?????

2. Connect an antenna to the UHF terminals of a TV. If a UHF antenna is not available, just use a piece of wire about a foot long with the ends connected to the two UHF terminals.

3. Turn on the TV and turn up the audio gain (TV's use much wider deviation). Slowly tune around channels 80 and 83. Occasional audio should be heard, but because the TV audio section requires a 4.5 Mhz signal, audio will be heard only when two cellular channels about 4.5 Mhz apart are active.

4. A second TV (assuming higher local oscillator and about 45 Mhz IF) could provide the necessary hetrodyne so that the first TV can detect a single incoming signal.

a. Tune the first TV (with UHF antenna) to channel 82 (80-83).

b. Bring the second TV as close as possible to the first and slowly tune it around channel 75 (72-76), until audio is heard...or

c. Retune by small increments...set the first TV, then sweep the second etc.

5. DISCLAIMER!!!!! Try this at your own risk......don't know the legalities/illegalities of listening to cellular phones......

HILL INTEREST REVS
TO FREE SPECTRUM

STATUS: House subcommittee chairman Ed Markey has reiterated his commitment to legislation to free 200 MHz of spectrum held for the government so that the FCC can use it to promote innovative radio-transmitted communications.

The first in a series of hearings on the bill, known as the Emerging Telecommunications Technologies Act, is scheduled for Nov. 1.

Government witnesses will be asked to testify on the feasibility of the legislation. Anticipated witnesses include the present head of the National Telecommunications and Information Administration (NTIA) Janice Obuchowski, FCC Chairman Al Sikes and several former agency heads, such as Bernie Wunder, Henry Geller and David Markey.

Al Sikes, formerly head of NTIA, referred to H.R. 2965 in an industry address touting innovation in common carrier technologies as a way of expanding spectrum for commercial services. Although Sikes has not formally endorsed the legislation, he did note his attempts when heading NTIA to discover ways government spectrum could be converted to commercial use.

THE WALL STREET JOURNAL, 10/25.

MIND WHAT YOU SAY; THEY'RE LISTENING, p.B1.
"...Eavesdropping -- both corporate and private -- is on the rise, thanks to the proliferation of surveillance technologies. And while sellers of the equipment and companies 'monitoring' employees have few qualms, right-to-privacy advocates and some lawmakers are alarmed. 'New technologies are changing the way we deal with each other and the way we work,' says Janlori Goldman, a staff attorney at the American Civil Liberties Union. 'Our expectation of confidentiality is being eroded.'"

AT&T INTRODUCES OPTICAL SYSTEMS FOR SENDING DATA, p.B5.
"New York-American Telephone & Telegraph Co. unveiled new optical transmission systems for data, video and voice communications. Two products in what the telecommunications giant called a new generation of such equipment are available now, AT&T said, and three others will be introduced in 1990 and 1991."

USA TODAY, 10/26.

SOVIET PHONE SERVICE IS A HANGUP, p.2B.

One of the more frustrating obstacles to smooth business dealings between U.S. and Soviet managers may turn out to be the telephone. The San Francisco earthquake showed just how bad communications can be between the two countries. At the USA-89 trade show in Moscow on Oct. 18, word of the Oct. 17 earthquake rumbled through the 140 booths set up by U.S. companies. No other news was available, so at 2 p.m. General Electric's booth hooked up a live satellite link to the GE-owned NBC-TV network and put Today on two television sets. Exhibitors crowded around the TVs, talking of friends or relatives in San Francisco and groaning that Soviet operators said they couldn't get a line out to the USA until 3 a.m."

What's wrong with doing it the way the instruction book says???
I have used mine with 6146/A/B/W and never had a problem.
The W's were so I could run RTTY with real long keydown. I was a MARS
operator in a remote part of Northern Germany and at Christmas time our
nets ran from about 5PM til about 3AM. I usually spent the last hour
or two sending all the accumulated traffic to the gateway station in
Pirmasens. Keydown periods longer than an hour were not uncommon.
And the only mod I ever had to make was to mount a muffin fan on top
of the radio to blow air over the finals.
Hearing about 101's again is kinda nostalgic. Maybe I should dig it
out and give it to my daughter when she finishes here NOVICE course.

I discussed the NiCd battery life problem of the Uniden/Bearcat 200XLT scanner in a series of articles published earlier this year in my column in the "RCMA Newsletter." Some of those articles are appended to this posting.

Since that time, I have experimented further with my 200XLT, shorting out Zener diode D203. This has the effect of recalibrating the low battery warning indicator to activate in the 4 to 5 volt range. This is low enough to get full use from the batteries, but too low to warn the user in time to risk reverse chaging a cell.

Since my scanner did not have a severe problem, I elected not to leave D203 shorted in my scanner, and restored the original circuit.

BATTERY CONSUMPTION OF THE UNIDEN/BEARCAT 200XLT SCANNER

by Bob Parnass, AJ9S

The Uniden/Bearcat 100XLT and 200XLT scanners are the first portable scanners with enclosed, slide on battery packs. Some 200XLT owners don't get the battery life they expect. They report having to recharge the slide on NiCd (Nickel Cadmium) battery pack after as few as only 3-1/2 hours of operation. Owners expect the battery pack to last longer, at least the 5 hours mentioned in the documentation supplied with the radio.

Much has been written about NiCd battery characteristics and charging in general. This article will not rehash general NiCd charging techniques. Rather, we will analyze the current consumption of the Uniden/Bearcat 200XLT scanner, and make recommendations specific to that radio.

BP-200 Battery Pack

The BP-200 battery case contains six Sanyo 600 mAh NiCd cells soldered in series configuration and wrapped in heat shrunk plastic. This pack furnishes 7.2 VDC to the radio. A charging regulator circuit and a light emitting diode are also contained within the battery case.

In contrast to the Yaesu FT-23R 2 meter walkie-talkie, which is supplied with a wall-mounted charger, the 200XLT wall-mount unit is actually a 12 VDC power supply. Since the BP-200 regulator circuitry is contained within the battery case, 200XLT owners cannot easily opt for rapid or trickle chargers.

Measurements and Their Implications

The 200XLT's current drain was measured under several conditions, and a graph appears later in this paper. Tests show that the 200XLT consumes more current on higher bands than it does on lower bands. For instance, listening on the 870 MHz band takes 13 mA more current compared with the vhf-lo band.

Measurements indicate that 200XLT current consumption is independent of scanning, searching, or manual modes, provided the scanning or searching is within the same band. This implies:

o If you must monitor 870 MHz frequencies for a prolonged period, it is more "battery-wise" to scan a mixture of 870 MHz and low band channels.

Several factors can contribute to "shortened" battery life. Shortened recharge intervals will be needed if using the radio with the volume control at a loud setting. In portable receivers, the audio amplifier stage generally consumes more current than any other stage. The 200XLT has a more powerful, cleaner audio output stage than do other portable scanners.

The factory supplied earphone is inconvenient and uncomfortable, but test results prove:

o Using the earphone decreases current consumption.

Using an earphone saves about 14 mA indoors, and about 50 mA in noisy situations where one might have the volume control set at maximum.

When using an earphone with the test radio, the best volume control setting was at the 10 o'clock position, versus 12 o'clock when using the internal speaker.

Listening to "busy" channels generally consumes more current than listening to infrequently used channels. One surprising exception, borne out by test results, is that:

o When using an earphone (at 10 o'clock volume setting), listening to busy channels actually consumes less current than when the 200XLT is fully squelched!

Improper battery charging can require the battery be charged more often than normal. If the battery indicator on the 200XLT's panel flashes, charge the battery pack for a full 16 hours. Test results showed:

o The low battery indicator flashes when battery voltage falls to 7.2 volts or less.

The 200 memory channels in the 200XLT are backed up by a capacitor kept charged by the NiCd battery pack. Current is required to retain the memory information, even when the radio is turned off.

How much battery drain is due to maintaining the memory information? To answer this question, the author measured the current required to backup the memory in the

200XLT. A Fluke 8024B digital multimeter indicated that:

o The 200XLT draws about 0.50 mA with the power switched off.

The six cell Sanyo NiCd pack is rated for 600 mAh capacity. If the batteries were perfect, and had infinite shelf life, the memory backup would drain a fully charged battery flat in 50 days:

600 mAh / 0.50 mA = 1200 hours
= 50 days

But no NiCd battery is perfect -- all have a finite shelf life. NiCd batteries will discharge by themselves, through spontaneous chemical decomposition, even when not connected to a load. The General Electric Company indicates that the average NiCd will lose about 1% of its capacity per day at 70 degrees F.

The author developed a discrete time computer simulation which shows that:

o The cumulative effects of self discharge, combined with 0.50 mA drain due to memory backup, will deplete a fully charged 200XLT battery pack in about

40 days.

A plot of the predicted daily decrease in battery capacity appears elsewhere in this article. The plot indicates that:

o To get the most use between recharges, charge your 200XLT right before using it. If you charge your 200XLT battery, but then leave it in a drawer for a week, you will have already lost 20% of the operating time before the next recharge is required.

Average self discharge at 100 degrees is about double (2% per day) the discharge at 70 degrees, which is a good reason to avoid storing NiCd batteries in a warm automobile. At 100 degrees, it only takes about 34 days to deplete the 200XLT battery.

Low Battery Indicator

As stated earlier, the 200XLT low battery indicator begins to flash when battery voltage decreases to 7.2 volts or less. This starts a 10 minute timer within the 200XLT. After the low battery indicator has flashed for

10 minutes, the 200XLT display blanks.

o Experimental results show that even after the 200XLT display goes blank, the radio will continue to draw approximately 50 mA.

In the author's opinion, the display blanking feature is a liability, not an asset, of the 200XLT. The owners' guide claims the 10 minute timer and display blanking sequence is designed to alert the user and prevent the batteries from full discharge. But, this assumes the user will notice the display is blank and take action.

Owners have been known to get up to 2 hours more use from the NiCd battery pack after the low battery indicator begins to flash. They turn the radio off, then back on, which resets the 10 minute timer.1 Uniden should just let the low battery indicator flash, omit the timer, and let the user decide what to do and when to do it. This would permit the 200XLT to be used longer.

Measuring BP200 Battery Capacity

The BP200 battery pack contains 6 cells and is rated at 600 mAh. Ron Smithberg experienced short battery life in his 200XLT. We measured the capacity of his battery using a procedure similar to the one recommended by Gen-

eral Electric and Motorola. Basically, we timed how long it took to discharge a fully charged battery using a resistor to draw current at its one hour rate. This test considers NiCd cells measuring 1.0 volts or less as "discharged."

1. We charged Ron's battery for 16 hours using the factory supplied wall power supply.

2. We placed a variable power resistor (approximately 12 ohms) across the battery terminals, and kept it adjusted to draw 600 mA from the battery.

----

1. Be forewarned that turning the radio off and on rapidly in succession may cause the memory to be lost.2 This may be due to a transient voltage spike. A note in November 1988 Monitoring Times recommended the addition of a 100 uF capacitor soldered across the battery to prevent transients.

3. We monitored the battery voltage during the entire test. When the pack voltage decreased to 6 volts, we noted the time, and stopped the test.

It took only 44 minutes for the 6 cell pack voltage to decrease from over 8 volts to 6 volts. Thus, the battery capacity was only:

600 mA * 44 minutes

= 26,400 mA-minutes

= 440 mA-hours

After performing the capacity test, Ron recharged his battery for 16 hours then used it immediately. He was then able to get more than 9 hours use, much longer than before. Apparently, Ron's battery was suffering the effects of NiCd memory.

NiCd Memory Effect

The owners' literature recommends that 200XLT owners run their batteries down periodically to avoid a NiCd "memory" effect.

o Avoiding the effects of NiCd "memory" is perhaps more important for the 200XLT than it is for other portable radios.

Owners who always recharge their battery packs at the first blink of the low battery indicator will not extract the full capacity of their battery. They will decrease its capacity.

Cell reversal can occur if NiCd batteries are permitted to fall below 1.0 volts per cell. There are at least 2 ways to "run" the battery down safely:

1. As described in the cell capacity test above, discharge the fully charged pack into a 12 ohm, 10 watt resistor until the pack voltage is down to 6 volts. This should take an hour or less. Then, recharge the battery for 16 hours.

2. Leave the 200XLT scanner on after the low battery indicator flashes and the LCD display blanks. Periodically remove the battery and measure its voltage. When the battery pack voltage reaches 6 volts, recharge the battery for 16 hours. This

method will take longer and it is easier for an owner to forget and let the battery voltage dip too low (below 6 volts). This may cause the loss of programmed frequencies, as well as possible NiCd cell reversal.

Conclusion

The low battery alert feature of the Uniden/Bearcat 200XLT is too conservative, and disables the radio prematurely. Owners can get longer use from their NiCd battery packs if they adopt good charging habits, such as discharging their pack down to 6 volts, and charging for 16 hours just before using the radio.

LOW BATTERY INDICATOR IN THE UNIDEN/BEARCAT 200XLT SCANNER

by Bob Parnass, AJ9S

Some Bearcat 200XLT scanner owners don't get the battery life they expect. They report having to recharge the slide on NiCd (Nickel Cadmium) battery pack after as few as only 3-1/2 hours of operation.

Last month, I discussed the results of several tests made on the 200XLT portable scanner to determine its current consumption. This month, I propose cures for the overly conservative low battery indicator problem.

As presented earlier, the 200XLT low battery indicator begins to flash when battery voltage decreases to 7.2 volts or less. This starts a 10 minute timer within the 200XLT. After the low battery indicator has flashed for 10 minutes, the 200XLT display blanks.

The low battery indicator in three 200XLTs examined is too conservative. Owners have been known to get up to 2 hours more use from the NiCd battery pack after the low battery indicator begins to flash.

The 200XLT Service Information Manual specifies the low battery threshold should be 6.9 volts nominal, with an acceptable range of between 6.5 and 7.2 volts. However, the 7.2 volt threshold measured in 200XLTs is almost out of range.

Zener diode D203, type HZK3CLL01TR, a surface mount component located on the Micom (microcomputer) circuit board, determines the low battery detection threshold.

I have not attempted to alter the 200XLT low battery circuit, but it looks like there are a few ways for an adept technician to fix it:

1. The threshold could be reduced if D203 were to be replaced with a zener diode of lower voltage.
2. The low battery circuit could be bypassed completely using one of two methods:

a. by removing D203, and connecting the input of regulator IC204 to the output of IC208, a 5

volt regulator, or
b. by removing R208, and replacing D203 by a
jumper wire.

- 12 -

The only drawback I could see is that defeating the
low battery circuit might cause memory loss when the
battery voltage becomes too low, because the micro-
computer doesn't detect the low voltage soon enough.

Again, the previous suggestions are conjecture, as I have
not tried either modification. Readers are cautioned:
experimenting with the 200XLT circuitry is risky. The
surface mount parts are tiny and the land patterns on the
circuit boards are fragile.

> So broadcast band images would not fall inside the band.
> fall inside the band.

Another good property of a 455 kHz IF is that no two AM broadcast
band stations beating together will generate a sum or difference
of 455 kHz, which would interfere with receivers en masse.

When a certain ham repeater and VHF paging station both in Joliet (IL)
transmit at the same time, the diffence in their frequencies is
10.7 MHz. This wipes out most Regency scanners in the Joliet area.

3567. Soldering PL259 connectors? Why bother!

Newsgroup: rec.ham-radio
Date: 1989-10-27 14:06:11 UTC
From: PJML@UK.AC.NERC-WALLINGFORD.IBMA
Message-ID: <27.Oct.89.15
Source record: 15987

Why, oh why, do manufacturers insist on fitting PL259/SO239 connectors
to their gear? A more horrible connector for RF is hard to think of.
(anyone remember RCA Phono-plugs being used for RF wiring some years back?)
At anything above DC, the PL259 is horribly lossy and non-constant-impedance.
Unless you tighten them up real tight (like with a small pipe wrench!) they
unscrew themselves and oxidise after a few years. They then get hot with RF!
The worst ones are the 'SO239-on-a-flying-lead' fitted to some of the
modern mobile rigs (and this at 144/220/430MHz too!!) which seem to plumb
new depths of flimsy construction. Whilst we can't all afford to go for
'N' connectors at HF, anyone interested in long term reliability should
studiously avoid SO239 'UHF' types. Specially avoid those where the center
insulator melts when you solder the inner. If you must use them, get ones
with PTFE insulation (which costs a bit more but stands solder temperatures
without melting away...) If you must use PL259, spend a bit more cash and
get good quality connectors (I can recommend Greenpar).
Long live BNC/TNC (specially above 30MHZ).
Try thinking of SO239's as 'screened test-prod connectors'. Throw 'em out
and fit something 'constant impedance'.
Also, how come there seem to be two different threads on the SO239? Jap
and 'Rest-of-the-world' ? They wont mate!

Any vacuum tube era radio repair people out here? I have some questions.

I have a fair number of books in my collection from the John F. Rider
publishing company. Many, perhaps most, of these books are by John F. Rider,
especially during the 30's. Is anyone familar with this publishing company
and it's history? Is it still in existence? I know that John Rider was born
in 1900. Is he still alive? Anyone met him personally?
How in the world did he manage to write so many books in such a short time?
How were Rider publications perceived as compared to Sam's and Audel?
What were the typical references used for repair work? For education?

>So broadcast band images would not fall inside the band.

Lets see now. If the LO is above the frequency to be received, and we
are listing to 540 kHz, the LO must be at 540 + 455 = 995 kHz.
Therefore the image to be worried about is 995 + 455 = 1450 kHz. That's
in the BC band. If the LO is below the frequency to be received, and we
are listing to 1600 kHz, the LO must be at 1600 - 455 = 1145 kHz.
Therefore the image to be worried about is 1145 - 455 = 690 kHz.

It seems to me that for quite a significant range of frequencies, the
image _will_ fall inside the AM BC band. I doubt that's the reason that
455 was chosen.

>Does anyone have any experience with ten-tec tranceivers in general, or
>with this model?

I own a Power-mite, Argo 505, Argo 509, Argo 515 and Century 22,
and have operated a Paragon for extended periods of time.

They are all excellent rigs; I would only consider another brand
if TT did not have a rig in the frequency range I wanted.
When they come out with their synthesized QRP HF rig, I'm going
to buy one (around $900), even though I obviously do not need
another HF QRP rig. I understand that their 2-meter HT is somewhat
of a loser (I haven't heard why), but if I ever see one at a hamfest,
I'll buy it anyway.

>I am familiar with the japanese lines, but not with ten-tec. I understand
>they have a following. Why?

My reasons:

o They are well-built and easy to work on. (For
example, the Argos use plug-in boards and have
lots of space inside.)
o They perform well (excellent CW characteristics,
great audio on SSB) under home-station and adverse
portable use.
o I don't care for gizmo-laden Japanese radios;
TT radios are simple and have uncluttered front
panels.
o The manuals are excellent and contain complete
alignment information (*)
o Factory support is superb; I have corresponded
many times with Al Kahn, chairman of TT. On more
than one occasion, the factory has sent me small
parts at no charge (example: dial pointer); other
times they have sent me parts I needed without
pre-payment ("fronted" me the parts, if you will).

(*) The one exception here is the Century 22 manual; I wrote
the factory asking for alignment information, and received
a personal reply form the man who designed the '22.

Ten-Tec radios have their quirks (example: PTO changes frequency
a few Hz. when you touch the metal part of the tuning dial) which
causes some hams to flame them, but for my bucks, they can't be beat.

Does anyone out there know how 455 kHz got to be such a popular IF ?
Why 455, (as opposed to 450 or 500, e.g.)?

Just curious.

73 de ka1rcv --- John Paul Braud (jpb@athena.mit.edu)

In the olden days when the first single conversion AM broadcast radios were designed, 455Khz was chosen because the band width of the AM band was such that there was little problem with images from within the AM band. This allowed manufacturers to build receivers with little or no front end tuning. (455khz*2 = 910 khz, which is a fair compromise, the "Q" of the tuned RF section would be sufficient to keep images reasonably down in the noise floor). This same engineering mentality holds true for the early FM broadcast radios, 10.7 mhz was outside the FM broadcast bandwidth, hince little or no image problem.

John Wells (supposed to be wisdom of the aincients)
WA0LHB in Ft. Fun, Coloradio

.It seems to me that for quite a significant range of frequencies, the
.image _will_ fall inside the AM BC band. I doubt that's the reason that
.455 was chosen.

For an IF of 455 (as opposed to 450 or 460), the LO will fall *BETWEEN*
stations, rather than on top of them. This would reduce interference to other
receivers, and would eliminiate images of signals with respect to 2*LO, since
2*LO +/- 455 is not a multiple of 10Kc (we used Kc in those days).

Another to add to your list: Active Electronics. Headquarters is
in Boston area, I believe. Some places like Active and Newark have
more than is in their catalog; Active tends to cater more to
hobbiests.

MiniCircuits Labs has packaged mixers, MMIC's, and a narrow range
of associated items. They have minimums, but if you do a lot of
that sort of experimenting, consider their "kits" of assorted
parts. Lately they have been pushing MMIC kits, and will also
sell you chip capacitors.

3574. Third Party Traffic, MM net and BARF get letters from FCC

Newsgroup: rec.ham-radio
Date: 1989-10-27 16:48:23 UTC
From: flash@lopez.UUCP
Message-ID: <968@lopez.UUCP>
Source record: 16002

For those who have been following the controversey on 20 meters, here is the latest:

Maritime Mobile net is now permanently on 14.300. The BARF (Better Amateur Radio Federation) NET is now on 14.313, former home of the MM net. BARF are viewed by some as frequency hijackers, as they took the frequency hostage.

BARF contends that the MM net exists as a TELEPHONE TOLL AVOIDANCE NET. They also are very vocal about any commercial use or seeming commercial use of the amateur spectrum. They site the IMRA net on 14.280, where missionaries do church "business" with their staff in other countries, and the BARFers state this is illegal activity.

The vocal BARFERS have caught the ear of the Friendly Candy Company, as we found out last night while monitoring the 14.343 meeting of MM net personel. Apparently several members of the Maritime Mobile net have received personal letters from the FCC, inquiring about Third Party Traffic. FCC is investigating the nature and scope of such traffic. The Net Manager for MM net advised those who received the letters to reply to the communication, but to include a phrase something like "We hope the FCC will not use such a small 'sample' of amateurs to make any determination of policy regarding third party traffic"...

Ham radio has a long history of traffic handling, witness the most recent coverage we have received during our efforts in Hurricaine HUGO and the S.F. Earthquake. In cases like THIS there is no question of the legality of third party traffic, we just get in there and pass it.

The contention apparently revolves around Phone patch traffic by pleasure boaters, some of which involve business traffic, or in any case could be handled as well by the existing Marritime Mobile commercial carriers. Ham radio is not intended to bypass commercial communications networks.

This reporter has been following the situation on 14.313 for quite a long time, has heard both sides of the story, and also monitored the Jammers and hecklers on frequency.

Needless to say, this situation should be a concern of all active amateurs.

One amateur has gone so far as to put his opinions on this matter into printed form, as the "14.313 Net News". His stand is that the tactics used by the BARF boys are wrong. For a copy of his publications, and other info on the 14.313 situation, send an SASE to:

Robert B. Brown, AA4DY
7200 Fifth Avenue North

St Petersburg, Florida
33710

Bob's son, Chris, who is 14, is an MM net controller, and also active in emergency communications.

Having spent 25 years in news reporting for broadcast and print journals, I personally can step back and see both sides of this issue. It is not going to be an easy one to resolve, but the fact that the FCC is now concerned should give pause to all. Apparently they are also concerned about the JAMMING on frequency which is quite malicious. Granted, the BARFers tend to be controvercial enough to incite the hecklers, but such behavior can not be justified under ANY circumstances.

I am not a member of any traffic net, but have passed traffic when asked to. In addition to emergency traffic, friendly greetings etc are not any threat to any commercial carrier. It is when amateurs blatantly solicit phone patch traffic that the activity becomes objectionable. I do not believe this is why the MM net was set up, and I know the net has provided a meeting place and many services to many amateurs over its 22 year history.

Perhaps net members have some comments.

I monitor 14.313 all afternoon and early evening. After 10pm EST, this operator can be reached on 3950khz. You may also write me at the lopez UUCP site, at the address in my sig.

AM BC receiver local oscillators are almost always above the received
frequency. I attended highschool when every kid had an AM transistor
radio surgically attached to one ear. It was a lot of fun to use my
local oscillator to jam nearby radios tuned above 990 kHz (oops, I
mean kc). _ _

There's a place called Antique Electronic Supply that advertises in the ham mags and in Radio-Electronics and Popular Communications. Here is an address and phone for them that appeared on the net late last year:

Antique Electronic Supply
688 W. 1st St.
Tempe, Az 85281

(602) 894-9503

I have their catalog at home but no reference here so I can't verify that this is current and correct info, but it should be a good starting place even if it has changed.

They sell several different crystal radio kits, ranging from breadboard types to ones in cases that emulate antique models.

Regards, Will

I can always reuse my PL-259 connectors. I have been doing as Myron says, and in addition, between e and f, I clip off the excess and smooth it with a file before assembly.

To get it apart, you only have to loosen the screw part and heat to unsolder the center conductor.

Great job with the description Myron!

>first to sell a Transistor radio and in what year?

While in high school I made two 4-transistor TRF receivers. All four
transistors were CK-722, the first transistor to be sold for under
a doller (i.e., 99 cents!) each. One of the radios I built into
a hollowed-out book (talk about hours of work with a razor blade!)
and the other I sold to one of my high school buddies.

I used my radio to listen to the world series while supposedly studying
in study hall. I was forced to endure study hall only twice during my
high school years, and I'm sure my senior year was NOT one of them.
I graduated in the spring of 1959; thus the above was probably done in
the Fall of 1957.

>Would you please tell how you know this information.
I was there.

Incidentally, my buddy eventually sat upon (or otherwise mangled) his
radio and he gave it back to me for salvage. I still have all of the
CK-722 transistors!

Marc: almost but not quite. Check the previous numbers I posted. The
images fall EXACTLY on the stations, and not between them. In order to
have images fall between the allocated frequencies for stations, they
should have chosen 452.5 kHz or 457.5 khZ for their IF. This isn't the
reason either.

I hate to always be negative; I would like to offer an answer for why
this frequency was chosen. However, I just don't know. I can, however,
rule out some possibilities.

If anybody has the answer, please speak up. All of us are curious now.

> know the details?

The BP-70 is really a 13.2 V pack and is supplied with the IC-2GAT, IC-4GAT, and (I believe) IC-32AT dualbander HT. It's rating is a mere 270mah, the same as the BP-3. However with the 1.8 amp current draw from the IC-2GAT at full 7 watts, this battery is going run down very fast.

As someone on the net said once before: "Welcome to the 7 watt 7 minute pack".

W&W Associates, and maybe also Periphex, makes 1200mah packs with 9.6v (less power and less current drawn by the HT) and 13.2v (for full power). Icom's own BP-7 has 13.2v at (I think) 450mah, or BP-8 at 8.4v and 800mah. You should also consider the BP-4 alkaline pack. You can put 6 nicads (for 7.2v up to 600mah) or 6 AA alkaline's (for my estimate of 2000mah) of 9 thru 6 volts (note that in the latter part of alkaline life, high power won't work).

+>
+>Aviation NAVAIDS are some of the slicker applications of radio
+>technology that you will ever find.....
+>
+>VOR - Stands for VHF Omni Ranging (I think). System uses a ground-based
+>transmitter that sends a phase encoded signal that looks like a "radio
+>compass" to the receiver......
+
+Actually, the VOR transmiitter has a rotating beacon that rotates through
+360 degrees and somehow encodes the bearing into the signal. The receiver
+in the aircraft decodes this and indicates through the OBS (Omni-bearing
+selector) indicator how far left or right of the selected radial you are.
+......

The VOR sends out two signals, one is a reference sin wave FM modulated on the carrier, The other is an electronically swept AM signal. When the two signals are in phase, the AM signal is sweeping magnetic north.

The receiver compares the phase of the two signals, compares that to the desired 'radial' as set by the OBS, and indicates a 'fly left' or 'fly right' via a meter movement.

Some receivers (such as my handheld) will read out directly the radial it is receiving.

The ILS does use one VHF frequency, but the glide slope is at
300~ mhz. Microwave Landing System (MLS) is coming Real Soon
Now (i.e. DON'T hold your breath)
The marker beacons are separate low power transmitters used to mark specific
points along the ILS approach.
The markers are on 75mhz, with different tone modulations for
the outer, middle and inner markers. Look for a Yagi pointing
straight up.

I think the description on VOR missed the key point. By send a
ref. and a delay/degree signal, VOR tells you the bearing of the
STATION to your plane, with NO relation to the DIRECTION you are
headed. Thus your section map has the rose on it, and you can
extend the line.

On the other hand, ADF tell you the radial relative to YOUR attitude.
If you are bouncing everywhich way, so will the ADF.

DME does in fact actively interogate a VOR/TAC station and count
onepotato, twopotato to figure out how far away the station is.
The station has a specified, fixed, delay time from RX to TX.
The TAC part means there is a co-located Tactical navigation
station. TAC is ~UHF VOR, but with DME. I guess the Jr. Birdmen
let us folks use the DME part.

Now GPS/Navstar, that's neat.....

Yeah, Frank, I saw Phil's INFOHAMS posting. I gotta admit, I agree with him, from a common sense attitude. You sometimes gotta trade off DRAMA (read that HOLDING THEIR ATTENTION) for SAFETY (read that COVER YOUR OWN BEHIND)...

(sarcasm mode engaged...)

:-) Maybe if you're in a hospital with a bunch of sick kids, it might not be a great idea, but hey, they got doctors and nurses there on the spot, right!?!

:-) Or maybe you could electrocute mice, just make all the kids sign an agreement that they won't leak it to the SPCA...

(...end sarcasm mode)

I was a lecture demonstrator for a university physics department for a while and we were always doing stuff to students, like making their hair fly up with a vandeGraaf generator and making chains and having one hold a flourescent tube and firing up the tesla coil...

If anything had happened, the university *could* have gotten into a doozie of a lawsuit, but in the years I had the job, and the five or six years my predecessor had it, and the fifteen or so years -his- predecessor was on the job, there were no unhappy incidents. I suppose we were (a) lucky and (b) too dumb to know better.

The more dangerous stuff, *I* got to do...

Of course, I did all kinds of dumb stuff as a kid, like setting off firecrackers in a coffee can and pouring vinegar and baking soda in a bufferin bottle and throwing it at the neighbor kid and I even got an old neon sign transformer and made a jacob's ladder once. Safety? That was for wimps, not me!

I didn't have any concept of that sort of thing then. But I sure had a lot of fun!

A very good friend of mine in college was blinded and lost part of his right hand by playing with fulmonate of mercury when he was a kid. He *was* a ham and I had talked to him on the air for six months before I knew anything about him. He went on to get his PhD in computer science.

One thing I have noticed watching Mr. Wizard on Nickelodeon is he is very safety conscious nowadays. He always makes the kids wear safety glasses and tells them not to do the fire experiments unless a parent or other adult is around. I *have* seen him burn wires and set hydrogen balloons on fire and do some of the dramatic stuff, but always with a

care for safety.

It takes some of the excitement out of it. But it still makes the point.
Sort of.

Oh well, I suppose there *are* safe ways to learn. The problem you
pointed out, that kids today are jaded by star wars and high tech, is
one to keep professional educators on the ulcer medicine. I've seen
teachers who can naturally and comfortable engage students and many who
just throw up their hands and ride the wave.

Maybe a shock or two will wake them up.

73, and keep on smilin'!

Building your own rig is great, but it's not a good idea to depend on
that for your first radio. I would recommend you buy a good used set
(the old tube units are quite reasonable nowdays). This way, you can
get on the air and OPERATE while you build. Later you can sell the
used rig and get most of your money back. By then you will know
what kind of features/performance you want and can make a wise choice
in selecting new equipment.

>> Tad, KT7H says:
>>
>> Actually, Rule 3b stands alone. But if you choose to interpret it as
>> part of Rule 3a, the mileage figure is 75 miles, not 275 miles.
>> Guemes, in relation to Tatoosh, meets this test. Butrule 3b

>Are you saying these two islands are more than 75 miles from the
>mainland? My understanding was that you could actually see Guemes
>from the US mainland. That would be less than 75 milesnormally.

N6RK

Tad says:

Nope! The islands are more than 75 miles apart. That's what I meant
when I said "Guemes, in relation to Tatoosh".

But, of course this mileage test you mentioned is part of a DIFFERENT
rule. Rule 3b SPECIFICALLY excludes any mileage test when it says "No
minimum distance is required".

Regarding where you can see Guemes from, you get there by a small ferry
that runs from Fidalgo Island across a narrow channel. You can see
Guemes across the channel.

]to. In addition to emergency traffic, friendly greetings etc are not any
]threat to any commercial carrier. It is when amateurs blatantly solicit
]phone patch traffic that the activity becomes objectionable. I do not

It may be objectionable, but unless it contains business traffic or
comes from a country without a third party agreement, it is NOT illegal.
There has long been a myth in amateur radio that phone patches (or
autopatches) cannot be used to evade tolls. It is just that - a myth.

I think one of the main problems with the MM net was that they used to
be very lax about checking the validity of the licenses of the amateurs
on boats for whom they ran patches. I understand that over the last year or
two they have been very careful.

Disclaimer: I rarely frequent 14.313, having only used it to find other
hams for a QSO, so I'm no expert on 14.313 practices.

Bulletin ID: SPC91030

SpaceNews

MONDAY OCTOBER 30, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* OSCAR-10 NEWS *

No operations are allowed through AO-10 until further notice.

* OSCAR-12 NEWS *

Here is the latest operating schedule for FUJI-OSCAR-12:

Date Mode Operating Period
---+---+---
05Nov89 | JD | 0948 - 1151 UTC
18Nov89 | JA | 0532 - 1142 UTC
25Nov89 | JD | 2247 - 0049 UTC (on 26Nov89)
05Dec89 | JD | 1951 - 2153 UTC

* OSCAR-13 NEWS *

Peter (DB2OS) reports that after reloading the onboard computer with IPS and the operational software, AO-13 appears to be working properly. Transponder operation was resumed on 13Oct89. All AO-13 users are asked to be alert to the possibility of another IHU crash. If the general VHF beacon is found to be sending an unmodulated carrier or if transponder modes are changing at radically different MA "counts" from the published operating schedule, then users are asked to cease AO-13 operations.

DB2OS and others have made another attempt to get RUDAK "on-line". RUDAK was designed to be a packet radio digipeater, but shortly after launch, the RUDAK "bootstrap" loader would not load the necessary software from ROM. The problem appears to be a defective PROM. A certain measure of success was recently achieved when the "bootstrap" loader started loading software from the ground. Although it was still not possible to load all the necessary software, the fact that the RUDAK "bootstrap" loader did work to a limited degree does leave some room for hope.

Here is the latest AO-13 Operating Schedule:

Mode B : MA 003...160
Mode JL : MA 160...200
Mode B : MA 200...240
OFF : MA 240...003

Note: Mode JL operations may not occur on time due to RUDAK testing.

The Bahn attitude is 208/-3. The omni antennas will be used from MA 240 to 060.
Mode S operations will begin early this week.

* SOLAR FLARE *

According to the Hiraiso Solar-Terrestrial Research Center, Communications Laboratory, Japan, a reddish aurora was observed for about 10 minutes from Wakkanai, Hokkaido, Japan at 11:45 UTC on 21Oct89. This same solar disturbance blacked-out HF radio communictions world wide.

[Story via Yoshiro Yamada, at the Yokohama Science Center, Japan]

* MIR NEWS *

The expected launch of an expansion module to the Mir/Kvant-1 complex on 16Oct did not occur. On 11Oct89, TASS reported that this launch had been delayed due to an electronics problem with the air lock, or "D" module. Final, pre-launch tests showed problems in the scientific instuments on the module, not in the control system itself. This air lock system is now set for a mid-November launch, while the Technology module (Module T) is set for February 1990.
The crew members, Cosmonauts Alexander Viktorenko and Alexander Serebrov, will maintain their original time table, and return to earth on 19Feb90.

* FEEDBACK WELCOMED *

I've had 2 2600's now. The first one quit during the first QSO (TX Problem), the second had a bad microphone. Now that I got that fixed... It's not bad but the selectivity could be much better. I'm going to velcro my active audio filter to mine. The other thing is it has a lot of birdies on my GM Riviera (1987). This total electronic nightmare causes a couple of birdies - 28.305 and several others. I use it only on SSB as I'm a Technician. For Novice and Technician it's too much radio. It would be better to get a multi-band rig when you upgrade. I bought mine because it was only a few dollars more than what Radio Shack wanted for an SSB only rig. I got FM and PL tone for almost the same price. All in all... I've got a Japan contact, an Austrian contact, and many US contacts from Oklahoma. You have to wait till the kilo-watters go home, then your 56, 58 mobile signal will get through. I usually call CQ as I get more contacts that way. If I try and compete, I lose. Needs a linear with maybe 100 watts for mobile. I like it. I'd love it with more selectivity though, as the QRM ruins some good weak contacts. Steve, N5OWK.

3598. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1989-10-28 23:34:02 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8910290736.AA00331@ucbvax.Berkeley.EDU>
Source record: 16025

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

A comment on the current required to hold the memory contents:

The .5 mA measured with the power switch in the off position is not the current required to maintain the RAM contents in the processor. Rather, it is being drawn by a voltage divider used to create a 5.6 volt regulator using a 3 terminal 5 volt regulator. A 10K resistor is placed between the regulator output and the ground terminal of the regulator IC. The regulator will force 5 volts across this resistor and therefore .5 ma will flow in it. The ground terminal of the regulator is connected to battery ground through 1.2K. This .5 ma will flow to battery ground through the 1.2K raising the regulator ground terminal .6 volts above battery ground.

The reason the designers wanted 5.6 volts from this regulator was to provide 5 volts on the other side of a diode which is used to isolate the regulator from the capacitor which holds the memory contents when the battery pack is removed. The RAM is located in the CMOS processor (IC201) so this 5 volt regulator provides the Vdd for the processor when the scanner is on.

I was able to reduce the switch off current drain by a factor of 10 by replacing the resistor between the ground terminal of the regulator and battery ground (R243) with a diode, and increasing the value of the 10K resistor (R244) to 100K.

Low battery warning:

I have also modified the low battery warning circuitry in my scanner so that the warnings start at 6.6 volts (originally 7.2V in my unit.) I had no data on the part (IC-204) that acts as a comparator to detect low battery voltage so I experimented with a resistive voltage divider in place of the zener diode (D203) and 150K resistor (R208). I ended up with a 5.11K in place of the diode and a 10K for R208. This circuit will draw .5 ma or so from a fully charged battery but this is negligable compared to the total current requirements of the scanner. (This current only flows with the power switch on.)

While these modifications have increased my satisfaction with my BC205XLT, I would not recommend them to people who have not had some experience working with surface mount components. Static discharge precautions should also be taken. Proceed at your own risk!

Jim Summers, KD7F

ARRL LETTER - Volume 8 - Number 20 - October 10, 1989

HOUSE ADOPTS BUDGET RECONCILIATION BILL WITH AMATEUR LICENSE FEES; OPPOSITION BUILDS IN SENATE

On October 5 the U.S. House of Representatives adopted H.R. 3299, the Omnibus Budget Reconciliation Act of 1989. A Schedule of Charges for the FCC is contained in Section 4701 (a), "Update of Fee Schedule." The bill proposes to amend Section 8 of the Communications Act by adding a new subsection (g) which would include the following:

PRIVATE RADIO SERVICES

7. Amateur License
a. New License (per application) $30.00
b. Modification of License (per application) 30.00
c. Renewal of License (per application) 30.00
d. Reciprocal Permit for Alien Amateur License 30.00
e. Renewal or Modification of Amateur Club, Races, 30.00
or Military Recreation Station License
f. Special Temporary Authority (Initial, Modifications, 30.00
Extensions)
g. Requests for Waiver
(i) Routine (per request) 105.00
(ii) Nonroutine (per rules section/ per station) 105.00

On the Senate side, at press time the Commerce Committee was preparing to introduce its version of the legislation for early floor action. The Senate version presently includes a $35 fee for amateur license transactions. ARRL's focus is on seeking an amendment on the Senate floor (see next story), to eliminate or reduce the fee in line with the policy adopted by the Board. ARRL members wanting to express their opposition to the Amateur Radio license fee should urge their Senators to cosponsor such an amendment, and if the amendment succeeds, should urge their Congressman to support the Senate version in the Conference Committee.

SENATOR LEVIN SPEAKS FOR AMATEURS, AGAINST LICENSE FEES; SEEKS COSPONSORS FOR AMENDMENT

The October 3 Congressional Record carries a statement by Senator Carl Levin of Michigan, expressing his opposition to proposed fees for Amateur Radio operators in H.R. 3299. In opening Senator Levin said "Mr. President,

I have recently learned that the Commerce Committee has chosen to meet its reconciliation responsibilities, in part, by imposing unprecedented fees on our Amateur Radio operators. It is ironic that this proposal comes at a time when we have been able to witness the achievements of the Amateur Radio operators so prominently in our daily headlines." Senator Levin continued, citing the "absolutely priceless" information provided to the world by the amateur community in the aftermath of Hurricane Hugo.

The Senator went on to say, "Amateur radio operators..are dedicated individuals who play a valuable role for our Nation in public safety, disaster relief, and emergency communications for national defense, among other services. ..in times of need Amateur Radio operators are transformed into a corps of highly trained public service communicators, who willingly work long hours as volunteers during disasters."

Senator Levin pointed out that the Senate Commerce Committee did not include other nonprofit organizations such as special emergency and public safety groups and public broadcasters in their fee schedule because of the public service they provide. He then came to the major thrust of his comments: "Mr. President, our Amateur Radio operators also provide an important public service, and we should not treat them any differently than we do other nonprofit service organizations."

Concluding his statement he said, "..I hope to be able to offer an amendment, when we take up the reconciliation bill that will address these unfair fees on our Amateur Radio operators. I invite any interested colleagues to join me in this effort."

Melinda Loftin is the member of Senator Levin's staff who is handling the matter, including lining up cosponsors.

IT'S OFFICIAL:
ARRL GOES TO COURT TO CHALLENGE FCC'S 220-MHZ REALLOCATION DECISION

On September 28, ARRL filed a "Petition to Review Agency Order" with the United States Court of Appeals for the District of Columbia Circuit. The petition requests the Court to set aside the FCC reallocation decision in Docket 87-14, and remand the matter to the FCC for redecision.

The petition contains only a brief overview of ARRL's argument that the Commission's action was arbitrary, capricious, an abuse of discretion, and not in accordance with the law; the substance will come later, in the League's statement of issues and pleading.

IARU REGION 2 MEETS IN ORLANDO

Ninety-seven delegates and observers representing 24 countries participated in the Triennial Conference of International Amateur Radio Union (IARU) Region 2, held in Orlando, Florida, on September 4-8.

There was a full agenda with over 100 documents under discussion. These documents dealt with a wide range of topics 2 (including approval of a special budget for WARC-92) and band-planning and operational matters.

The new Region 2 Executive Committee elected to serve for the next three years include:

Alberto Shaio, HK3DEU, President
Fabian Zarrabe, YS1FI, Vice President
Tom Atkins, VE3CDM, Secretary
Steve Dunkerley, VP9IM, Treasurer
Frank Butler, W4RH
Guillermo Nunez, XE1NJ
Willy Gravenhorst, PJ2WG
Alfonso Alvarez Calderon, OA4PQ
Reinaldo Szama, LU2AH

ARRL AWARDS NEWS

The Region 2 Conference meeting in Orlando has adopted a change in policy in regard to awards credits on 10 MHz. This will bring that policy into conformity with Regions 1 and 3 which already permit awards credits. Thus, effective immediately, ARRL now accepts 10 MHz contacts for the following awards: WAS (basic, CW, RTTY, Packet and QRP, but no single band or 5 Band WAS); DXCC (CW and digital QSOs for the mixed, CW and RTTY awards, but no 5 Band DXCC).

10 MHz users are reminded to avoid causing interference to stations operating in the Fixed Service. The Conference noted the special need to maintain the highest operating standards in the period prior to the 1992 World Administrative Radio Conference.

ZL OPERATING MADE EASY

The New Zealand Association of Radio Transmitters Inc., announces the establishment of a liberal visitors' operating permit. Effective immediately, all amateurs regardless of class, may operate a handheld transceiver on the VHF/UHF bands without prior licensing approval. There is no application to complete and no fee, however, certain conditions apply:

- Licensed visitors may use VHF/UHF handhelds on frequencies 144 MHz and above available to amateur stations in ITU Region 3. For example, operation on the 220 MHz band is not permitted in New Zealand. See section 97.301 of the FCC rules for a complete listing of frequencies authorized for amateur use in ITU Region 3.

- Operation is for a period of not more than 4 weeks.
- The visiting amateur must be the holder of a current license issued by their own administration.
- A copy of the current license must be carried while operating
- Use of the apparatus must conform with the requirements of the New Zealand Radio Regulations 1987 and the general terms and conditions shown on the license schedule.
- The visiting amateur must use the home callsign suffixed by ZL 1, 2, 3, 4 as appropriate.

Full license privileges continue to be available under normal reciprocal agreement where these apply.

MICROSATS PASS ENVIRONMENTAL TESTING; MUST WAIT FOR LAUNCH

All four of the AMSAT MICROSATs (PACSAT, LUSAT, DOVE, and WEBERSAT) completed the necessary environmental tests, that is, thermal vacuum and vibration tests with flying colors. This means the MICROSATs are now certified to fly aboard the Ariane IV launch vehicle.

Official word received on September 29 from Intelsat and Arianespace representatives indicates that launch may be delayed at least 4 weeks from the original date of November 10 to correct problems with the Ariane IV launch vehicle. The AMSAT launch team will use this time to perform additional system level and software testing on the satellites.

ARRL/VEC REACHES MILESTONE

Volunteer Examiner Department manager Bart Jahnke, KB9NM says that on September 27, the department processed examination session number 10,000. This session was conducted by the Grand Rapids Amateur Radio Association, of Grand Rapids, Michigan earlier that month. To mark the occasion, the VEC will send the Grand Rapids ARA a certificate and letter of recognition.

More than 121,000 candidates have been served by the ARRL/VEC during the 10,000 sessions. July 21, 1989 marked the 5th anniversary of the ARRL Volunteer Examiner Coordinator.

SOLAR CYCLE 22 READY TO PEAK

During September, the solar flux went on a "rollercoaster ride" peaking at 305 twice in three days then dipping to 155 - but even this was high enough for good propagation on most HF bands. Conditions should improve during October, with the best days of the fall season expected to arrive in November.

The latest solar and geomagnetic field data is transmitted at 18 minutes past the hour by WWV in Boulder, Colorado. The same information is transmitted by WWVH in Hawaii, at 45 minutes past the hour. The K index is revised every 3 hours. A K figure of 3 or more indicates poor propagation or even complete loss of communication on high latitude paths. Trans-Equatorial propagation is not usually affected and may even improve under high K conditions.

Even the lowest solar flux readings for the next year or so should be high enough for good work on most all HF bands. The next year or so should also provide ample opportunities for DX work on 50 MHz.

AMATEUR RADIO "NEWSLINE"

"Newsline" is a ten minute audio report covering a variety of amateur related subjects. Many HF, VHF, and UHF nets transmit these weekly reports. If you are unable to hear Newsline on the air, it is available by dialing 312-289-0423 (Illinois) or 213- 462-0008 (California). The report is usually updated on Fridays.

Additional information about "Newsline" may be obtained by writing to Norman Chalfin, K6PGX, PO Box 463, Pasadena, CA 91102

W1AW TO EXPLORE OPERATION ON WARC BANDS

W1AW is expected to start experimental bulletin transmissions (CW/RTTY) shortly on 18.100 and 10.140 MHz. Stay tuned to W1AW bulletins, QST and The ARRL Letter forthe latest available infomation.

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Agnes Carbon.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2066

--------------------------------------------------------------------------------

SAN FRANCISCO EARTHQUAKE--When the worst earthquake in the United States
since 1906 struck San Francisco last week, the ABC television network was
just beginning its live broadcast of a baseball World Series game. The
picutre immediately vanished, and after a brief announcement from a shaken
announcer in the stadium, the network filled with a comedy program.

All of the television stations in San Francisco went off the air. KNTV in
San Jose, closer to the epicenter, had problems because it's transmitter was
damaged. The network stations in San Francisco, KGO, KRON, and KPIX returned
on generator power. KRON had problems and for awhile was broadcasting from
the transmitter shack on Mount Sutro, and feeding both NBC and CNN with an
uplink provided by Sacramento's KCRA, which had satellite gear in San
Francisco to cover the World Series.

In fact, because telephones, landlines, and even cellular telephones were
out, the only coverage out of San Francisco at the beginning was coming from
the networks with satellite trucks at the baseball park, including the sports
network ESPN.

It turns out that while most of the world followed the earthquake by
television, local residents relied on radio. And it was MW radio that did the
best job--the local FM stations went on playing music.

The ABC radio network put KGO radio on a satellite for feeds that were
carried by many ABC affiliates. KGO itself managed to continue broadcasting
on 810 kHz. Two of its three antenna towers crashed, and the station was
reduced from 50,000 watts to just 10,000 watts. The other network affiliates,
```

KCBS on 740 and KNBR on 680 kHz, have also been praised for their coverage.

As usual, radio amateurs provided emeregency communications. Ham radio reports from the earthquake zone could be heard on 14275 and 14280 kHz. Locally, 145.150 MHz carried a lot of activity. Scanner monitors could follow the Oakland police on 154.295 MHz, the Cypress Command Post on the Fire Department's 47.06 MHz, and CalTrans maintenance on 42.18 MHz.
(Thanks to contributors to the CompuServe Broadcast Professional and HamNet Forums)

SATELLITES--Arianespace has found a problem with the pyro initiators of the Ariane 4 third stage of missions V34, V35 and V36. This problem will cause at least a one month delay in the launch of SPOT-2, along with the MicroSats and UoSATs. ("SpaceNews" via Kauto Huopio, Finland)

CANADA/AUSTRIA--The RCI relay via Radio Austria International is now on 11925 kHz at 03:00-05:00 in English and French. (Joe Hanlon, USA)

COLOMBIA--La Voz del Valle de Sibundoy in Putumayo was heard at 21:50 on 5550 kHz. (Yimber H. Gaviria, Colombia)

ECUADOR--Updating SCDX- 2059, Radio Nacional de Ecuador can be heard on 15220 kHz at 17:30-18:00 and on 640 kHz at 03:30. Radio Cadence Nacional in Guayaquil broadcasts on 610 kHz with a power of 50 kW but the announced frequency of 4910 kHz is not audible. Radio Atalaya broacasts also from Guayaquil on 680 and 4760 kHz. (Yimber H. Gaviria, Colombia)

Due to a lack of time caused by his new duties as head of the English departement, HCJB's Brent Allred has temporarily dropped the Monday edition of the DX Party Line, leaving only the Saturday Edition. (Joel M. Rubin and Thomas Sundstrom, USA)

FRANCE--Radio Monte Carlo has plans to broadcast on FM in Paris before the end of the year. North and Latin America should be next (our listener does not say if this would be on FM or MW and what) at the beginning of next year. RMC relays SOMERA programmes in Arabic for the south of France, North Africa and Arabic countries on medium waves (1466 kHz). The RMC transmitter in Cyprus will double its power (600 kW to 1200 kW) and the station has plans to build a new transmitter in an Arab country to be heard in Yemen and further east. ("Liberation" via Bernard Chenal, France)

Radio France International now broadcasts its English news bulletin at 12:30-12:55 instead of 12:45-12:55. The frequencies remain the same. (Edwin Southwell, England)

GREECE--The Voice of Greece was heard with news in English at 15:30, followed by Swedish at 15:40 on the new frequency of 17535 kHz. 15630 and 11645 kHz were announced along with 17535 but the first two frequencies were not heard. (Joe Hanlon, USA)

IRAQ--Updating SCDX-2053, Radio Baghdad in English for Europe is now an hour later at 21:00-22:50 on 13660 kHz. (Joe Hanlon and Thomas Sundstrom, USA)

PANAMA--Following the uprising against General Noriega at the beginning of October, the Panamanian government has cancelled the frequencies allocated to the "La Exitosa" radio network. La Exitosa itself broadcast on 740 kHz. The Exitosa network, the state owned radio station and Channel 4 television all broadcast the statement made by the rebel officiers, but the directors of Radio Nacional and Channel 4 say they did it under threat. (BBC Monitoring)

PORTUGAL--Radio Portugal announces broadcasts at 02:30 hrs to Eastern North America on 9600 kHz and to Western North America on 9705 kHz; and at 19:00 hrs to the Middle East on 21530 kHz, 15250 kHz to Africa and 11740 kHz to Europe. At 02:30 hrs, 11840 and 9680 kHz can still be heard in addition to the announced frequencies. (Thomas Sundstrom, USA)

SUDAN--Radio Omdurman in Sudan has been observed since the beginning of October with a relay of its general program on 11625 kHz at 03:55-06:00 and 10:55-19:00. The programmes are mainly in Arabic except at 15:30-16:00 hrs when there's a broadcast in English. This English transmission has also been heard on 9540 kHz, a frequency also used to relay the clandestine Radio Voice of Ethiopian Unity at 04:00-06:00 and 18:00-20:00 hrs. (BBC Monitoring)

SWITZERLAND--RSI is now on 15570 kHz, replacing 5965, to South America at 22:15-01:00, in Portuguese, Italian, German, French and Spanish. 9810, 9885 and 12035 kHz are still in parallel, the latter via Gabon. (Joe Hanlon)

UNITED KINGDOM--Updating SCDX-2064, according to "Waveguide", the additional BBC transmitters on Ascension island will be used for a morning broadcast to South America from 09:00 on 15180 kHz. The experimental broadcasts from Brazil have been discontinued. (Joe Hanlon, USA)

UNITED STATES--Updating SCDX-2064, the Christian Science Monitor station WSHB in South Carolina is now using 15610 kHz at 20:00, instead of 15225. At the same time, its sister station WCSN in Maine broadcasts on 13770 kHz (ex 15610) to Europe. (Kjell-Aake Hult, Sweden; Joe Hanlon and Thomas Sundstrom, USA and Aristides Ginannarelis, Greece)

USSR--Radio Minsk has been observed with a new broadcast in Belorussian for listeners in North America from 23:30-24:00 daily on 17690, 15180, 11675 and 9610 kHz.

Latvian Radio has introduced a new transmission in Latvian to Western Europe from 17:30-18:00 on 1143 kHz. (BBC Monitoring)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
02:30 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21655 kHz (East Africa)
18:00 hrs on 1179, 6065, and 7265 kHz

21:00 hrs on 1179, 9655 and 11705 kHz
23:00 hrs on 1179 kHz
00:00 hrs on 1179 kHz

And to Asia and the Pacific:

12:30 hrs on 15190, 17740, and 21570 kHz
14:00 hrs on 11905 and 17740 kHz
01:00 hrs on 7225 and 9640 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 20 contributors this week Good Listening!

3602. Re: Down with SO239 connectors!!

Newsgroup: rec.ham-radio

>Unless you tighten them up real tight (like with a small pipe wrench!) they
>unscrew themselves and oxidise after a few years.

[rest of the religious dogma deleted]

I challenge you to measure the loss through this connector at
2 meters or 440. I sure can't and I have some pretty spiffy test
gear. Sure, I can see the impedance discontinuity on a TDR but it
does not look much different than a BNC. Besides, impedance bump != power
loss at low UHF and below.

There's a really good reason why the PL/SO connectors are still around.
They do the job and they are cheap. The day I can buy a silver-plated,
teflon insulated N connector for 50 cents is the day I'll swap. Until
then, the good 'ole UHF connector will work nicely.

Oh what the heck, I must be all screwed up. After all, I use 75 ohm
CATV hardline in my shack too. That it works just fine with very low
loss does not affect the "experts" who continue to tell me that it will
not work. Must be the UHF plugs I use on each end.

I have been in the science business for over 20 years and have never heard anyone refer to magnetic fields in Tesla - everyone uses gauss. It is true that people know that someone somewhere created a unit of magnetic field called a Tesla, but no one remembers how many gauss are in one Tesla, and no one uses it. Sometimes it might appear in a textbook (usually directed at freshmen or sophmores - more advanced books use gauss).

There are lots of names of units out there that are simply not used.

(Also, I might add, a lot of people refer to actual physical magnets, though not the fields they create, in megahertz - as in "it's a 500 MHz magnet" meaning, of course, that the NMR resonance frequency of protons in it would be 500 MHz." Even the people who do this snicker a bit while doing it, however.)

3604. How to charge Kenwood PB-21H?

Newsgroup: rec.ham-radio
Date: 1989-10-29 18:51:28 UTC
From: blob@Apple.COM
Message-ID: <36032@apple.Apple.COM>
Source record: 15930

I've recently acquired a PB-21H battery for my Kenwood TH41 handheld. Does anyone have any idea what I need to charge this battery? I could go buy a BC-2 or BC-6, but I could also probably buy something at half Kenwood's price, if I knew what was needed. The battery and its packing materials give no clue.

The PB-21H is the high-powered battery for the Kenwood TH21-31-41 series. Output is 7.2V DC (500 mAh).

3605. Re: info on Crystal Radio kit or schematic

Newsgroup: rec.ham-radio
Date: 1989-10-29 18:54:56 UTC
From: tad@ssc.UUCP
Message-ID: <252@ssc.UUCP>
Source record: 15943

I tried to send e-mail to the orignial poster on this, and it bounced, so I will post a follow-up to the follow-up posting!

Until a few years ago, you could order cheap little crystal radio kits with nice handmade cats whiskers from Modern Radio Labs in California. I think the fellow who ran MRL passed away.

Here is how to build one, without schematic.

For a crystal detector use a 1N34A or equivalent Germanium diode. Also use a 365 pf variable capacitor, and a parallel coil which can be a ferrite loopstick from an AM radio or just a bunch of wire wound around a toilet paper tube. If you want to get fancy, look up the coil calculation formula in the ARRL Handbook and consctruct one that will put you at about 1 MHz when in parallel with about 180 pf.

Other than that, you will need an earphone, and a capacitor to go in parallel with the earphone that is about .1 mf.

Use a ground connection and an antenna, which can be just a piece of wire as long as possible. If you are near any AM broadcast stations, the wire wont have to be very long.

The parallel coil and variable cap runs from the antenna to the ground connection. The 1N34A diode (you can use Mororola or RCA equivalents...this is non-critical...just dont use a SILICON diode!) runs from the antenna side of the coil/cap to one side of the earphone (not sure if polarity matters, but try it with the cathode end on the antenna side). Then attach the other side of the earphone/.1mf cap parallel combination to the ground side of the coil/cap.

I built so many of these when I was a kid that the schematic is forever etched in my memory.

Have fun!

(I wonder if anyone has built one of these to successfully detect shortwave broadcast stations?)

3606. Re: Phone Patch Construction question

Newsgroup: rec.ham-radio
Date: 1989-10-29 19:07:13 UTC
From: tad@ssc.UUCP
Message-ID: <253@ssc.UUCP>
Source record: 15944

The main problem with constructing a simplex phone patch is that
the radio needs to interrupt transmission every couple of seconds
to listen for the mobile station. There was an article in 73
Magazine about 10 years ago by a guy who worked for Teltone. It
described a circuit using a Teltone DTMF decoder chip. Once the
DTMF chip received the correct command followed by a phone number,
it would begin transmitting back the audio from the phone line
with 40ms interruptions every 1.5 sec to receive any signal from
the mobile. When the called party answered, the mobile would
transmit 2 seconds of carrier to make sure they had grabbed the
patch, and start talking. The trick is to minimize the 'click-click'
in the audio.

If I were going to do this today, I would buy one of the simplex
auto-patches advertised in the ham magazines.

Legality of this setup is questionable.

73,
Tad Cook
tad@ssc.UUCP
KT7H @ N7HFZ

Oh, the author of the 73 article, which was sometime between 1979-82
was Charles Zappalla.

NMR spectroscopists refer to their magnets in proton resonance frequency as well as field in TESLA. A 500 MHz magnet is 11.7 T, a 60 MHz magnet is 1.6 T, etc.

Jeff Forbes

Ummm... In the world of analytical chemistry and in some other areas where large magnets are often in use the Tesla is used to measure large fields. For example, Nicolet Instruments, the company which currently holds the patent on Fourier transform mass spectrometers, advertises all of their magnets in Tesla values as do most other manufacturers in the analytical chemistry market.
In general, when I was working in analytical chemistry at UC Riverside, the only place I heard the gauss values used was in the Bank of America's specification that credit cards were unsafe past the 50 gauss line. The magnets were always, to us, thirteen, seven, and three TESLA.
Of course, everybody also used "torr" to refer to "mm Hg," which people in some fields would find odd. I suppose the point is that just because your area of work has different conventions than someone else's it isn't really yours to say that some unit or another is NEVER, EVER used.

I use Tesla (or, rather, nanoTesla) all the time. But I have only
been in the science business for 17 years so I had a chance to
learn the SI system properly ... :->

The gauss is the older unit, still used a lot, especially in older sources and by older writers. The Tesla is the correct modern unit; if you look around, you'll see increasing use of it in most fields.

Speaking as a Gauss-person who would prefer to see otherwise :-),
I regret to inform you that the Tesla is indeed being used in the real
world to replace the Gauss as a unit of magnetic flux density measurement.

Many magnetometer and magnetic instrument manufacturers, such
as F. W. Bell, Humphrey Inc., FRL Industries and Walker Scientific now
use the Tesla instead of the Gauss as their unit of specification.
However, it is somewhat amusing to note that while these vendors still
refer to certain products as "gaussmeters", they are now specified
using the Tesla as a unit of measurement; sort of an oxymoron, huh? :-)

Since I have already survived and coped with the Pascal, the
change to Tesla was less traumatic than I had imagined. Incidently,
the nanotesla (nT) seems to have replaced the gamma (.00001 Gauss) where
finer magnetic flux measurements are concerned.

Re: AO-13'S IHU HAS CRAHSED!

It appears that OSCAR-13's on-board computer has crashed. I
have just received a T-MAIL message from DB2OS a little while
ago and he says that VK5AGR says that the signs of a IHU crash
have again returned. So until further notice, DON'T USE
OSCAR-13. If you wish to help, please monitor the telemetry
beacon on 145.812 MHz. If you don't have a G3RUH PSK 400 Baud
demodulator, then you can listen for the CW beacon at the top of
the hour and at the half hour. The fact that you don't hear a
CW transmission at those times is important to DB2OS to know.
Please tune into the AMSAT 20M International Satellite Net
tomorrow at 19:00 UTC on 14.282 MHz. We will have any updates
at that time. 73's Dave Cowdin, WD0HHU, AMSAT NEWS SERVICE
Director.

Edited for Packet by KD9QB - From AMSAT T-MAIL

To: AMSAT
Subj: AO-13: U R G E N T !!!!

I just got a call from Graham VK5AGR with bad news.
At AOS no transponder, nor beacon was heard (MA20..)
from AO-13, which should be in Mode-B operation.
The latest telemetry which I copied was on MA245, 21:29 UTC
and all was absolutely normal..
Graham will now try to send some commands to the IHU and
wait to see what happens when Mode-L period starts.
If we get no sign from the s/c until tomorrow, we have
to do again the Reset and software reload procedure..

UNTIL FURTHER NOTICE: D O N O T U S E O S C A R - 13 !

There are too many units out there that ARE being used. That is the reason various international technical standardization organizations has strived for a minimal set of clearly defined units. Unfortunately, there are many authors who insist on dragging their feet on the changeover, so that one often sees, for instance cgs and SI metric units intermingled, even within the same equation ! I note that refereed journals usually require SI metric, but allow obsolete cgs units "where traditional." This is an unfortunate loophole. I'm an electrical engineer. I have to deal today with gauss, tesla, and microns, all to describe the same parameter. (I won't even mention the profusion of inch-based electro-magnetic units which are STILL found in new textbooks).

Let's not even start on the disgraceful reluctance of certain sectors of U.S.A. engineering, mechanical engineers in particular, to expedite conversion to metric measure.

I am looking for any information on a JVC model SR-6600 portable
shortwave receiver.

Has anyone out in `net-land' ever heard of one? Bought one?

If so, how does it perform? Does it meet the specs? Any
problems? Where did you purchase it and what was the cost?

Please respond via e-mail or phone me directly. I would
appreciate any response.

Tnx es 73.

From: root@raider.MFEE.TN.US
Message-ID: <149@raider.MFEE.TN.US>
Source record: 15937

Having just been bitten by the ham bug again after 8 years of inactivity, I wonder if it is possible to get my original callsign back.

My original call was WB4QVO. About three years ago, I happened across my ham ticket and was horrified to find it had expired. Luckily, I was still within the grace period for renewal, so I applied for renewal. That's when they sent me the call N4CDO. I didn't think much of it at the time, since I wasn't active, and didn't plan to be.

Now that I'm getting back into it, I really miss my old call. Is it possible to get it back ?

Could someone with a callbook see if this call is in use ? Email would be appreciated.

>Doug McDonald

Whoa, thea, padnuh. The "Tesla" is alive and well, thank you. If I walk over to the High Volt Lab, I find people quite comfortable with kilogauss or tesla (not the same, of course), as they torture innocent protons.

Engineering textbooks through the graduate level tend to use MKS units, which include Tesla. Physics textbooks, on the other hand, tend to use cgs, which include gauss. I have several of each brand of text. For genuine pandemonium, look at plasma physics texts. In ionospheric physics, there is no standard at all, but a pretty free mix of cgs and MKS. Chen's plasma physics 1st ed was in cgs: the second is MKS. You be the judge.

Actually, I prefer cgs all the way, myself, but I'm not dogmatic about it, even though it ought to be obvious that cgs units are The One True Units. On the other hand, E/B in MKS has units of velocity, which is convenient. But on the other hand, E/B in cgs has no units at all, which is also convenient. On the other hand, my Radio Shack voltmeter insists on giving me MKS units. On the other hand, Jackson is a nice reference, and uses cgs, so it must be good.

So, as I said, I don't insist upon cgs, because this is a free planet.

But, come the revolution, the MKSeoisie will be the first with their backs against the wall.

[rest of the religious dogma deleted]

*gem.mps.ohio-state.edu!ctrsol!emory!stiatl!rsiatl!jgd@tut.cis.ohio-state.edu
*(John G. De Armond) replies:

*I challenge you to measure the loss through this connector at
*2 meters or 440. I sure can't and I have some pretty spiffy test
*gear. Sure, I can see the impedance discontinuity on a TDR but it
*does not look much different than a BNC. Besides, impedance bump != power
*loss at low UHF and below.

John, using a 1502 TDR at 500 mp/div I see quite a (very) noticable bump
with the 259 series of connector. With the N series it is hard to even
see the connector without going to 200 mp/div. Looking at the BNC it
appears to be just a LITTLE worse than the N series but no where near
the 239. The N series also offer a better degree of weather sealing.
Your challenge to measure the actual loss intrigues me, I'll try that
very soon using a 8640 sig-gen and 494 spec-an. Hmmm, better yet maybe
I can use a FDR and provide a good graph from say 30 mhz to 1 ghz. That
would provide a more conclusive test. Give me a week and I'll post the
results.

*Oh what the heck, I must be all screwed up. After all, I use 75 ohm
*CATV hardline in my shack too. That it works just fine with very low
*loss does not affect the "experts" who continue to tell me that it will
*not work. Must be the UHF plugs I use on each end.

75 ohm hardline will not work for anything other than cable TV, any
idiot knows that. Of course I have never been able to convince the
RF to follow my instructions and the darn stuff runs through it anyway.
I just can't get any respect!

>The gauss is the older unit, still used a lot, especially in older sources
>and by older writers. The Tesla is the correct modern unit; if you look
>around, you'll see increasing use of it in most fields.

Listen well to Henry, my friends. Picofarads have been in use for lothesemany years, but when I was first getting interested in this stuff (late '50s), the usage was micromicrofarad, usually abrev.d MMFD. Too, microfarads were abrev.d MFD. Those fine days are past (Subhan Allah!).

It took several months before I even was able to discover wuthehell MMFD stood for -- Pop'Tronics ran a nice basic article on capacitors. Still, it was MM instead of pico for at least ten more years.

Only in the past ten years have nanofarads come into use, and it's still common to see a cap rated in thousands of microfarads rather than millifarads.

Consider this one: how many hams and other electronikers do you know who pronounce dB dee-bee, and how many of them actually know it means decibel? Then, how many of them have ever heard of a bel? For the real joker, how many of 'em know what a bel is? It's a lot easier (IMHO) to explain bels than decibels. Think again: how often do you see something rated in tens of decibels, rather than bels? WHY?

Habit, I suspect, coupled with the natural conservatism that we all possess. This will change. How many people do you know who know the peta- and exa- prefixes, and the femto- and atto- prefixes? (Admittedly not useful to most of us, unless you're measuring the circumference of Pluto's orbit in electronic radii....;^)

We all wear blinders of a sort, lacking omniscience...at least I do; maybe you know all. But, with improved communication, and the old (unwilling) making room for the younger, "these, too will pass away."

Too much rambling; good night.

The bel is of rather recent vintage, 1923 [A Dictionary of Scientific Units,
4th Ed., Chapman & Hall, 1980]. This source contains the statement that "in
continental Europe, the neper is used instead of the bel." Is this true,
European readers ?

3622. Correction re Antique Electronics Supply

Newsgroup: rec.ham-radio
Date: 1989-10-30 13:40:47 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <8910310802.AA27098@ucbvax.Berkeley.EDU>
Source record: 15827

My apologies for posting false information. I had mailed a note to the person who asked about crystal radio kits pointing him to Antique Electronic Supply as a source. Ironically, the next day I received a catalog from them in the mail. The address and phone # I had posted were correct, but my recollection that they sold various crystal radio kits was wrong. Their catalog lists no such kits. They do have some tube-radio kits, though. I dug out back issues of their catalog, and the latest one that had a crystal radio kit (the old breadboard one, I believe the same one that used to be sold under the brand "Philmore") was 1985. I'm sure I've seen some literature from *somewhere* advertising crstal radio kits, but now have no idea where that might be.

Luckily, I suppose, my mailed note to the inquirer came back as "undeliverable" so this message is to correct the info that I CC'd to the hams list.

Regards, Will

Hey... you are sounding like Glenn "all radio stations with a religious affiliation are bad" Hauser. The Christian Science Monitor's radio stations have the same news content as the newspaper, and the same structure: good, "unbiased" news reporting, with clearly delimited religious content (I don't remember if there is any religious content at *all* during the weekdays, though). On the weekends, on the other hand, they do broadcast Christian Science religious broadcasts instead.

It's a station worth listening to, if you haven't done so previously.

Disclaimer: I am not a Christian Scientist, and have to admit that I find Mary Baker Eddy's writing somewhat perplexing. But I still like the radio station's news programs.

>
Well, looking in the 'callsign project' database (curent as of
September 1, 1989), I find:
WV0P|WRIGHT||COLIN|R|64008|89220|99220|1031 TURNER BLVD 4|OMAHA|NE
68105|*|*|*|E| KF0DY|A|*
(Translation: Colin R Wright, 1031 Turner Blvd #4, Omaha NE 68105.
He is an Extra, and used to be an advanced with license KF0DY.
he was born on the 8th day of 1964, and his license expires on
the 220th day of 1999. His station location is the same as his
mailing address, and theres some other junk even LESS interesting :-),
which I will ignore. However, notice that the FCC's latest
processing of his license happened on the 220th day of 89, which
means August 8, 1989 (a Wednesday, it turns out). So its not
too suprising that the update does not have him yet. Anyone
have the 1990 callbook? I'd be interested to hear if he's
in it....)

(For all those (30 or so) people who are anxiously awaiting the
database this year and who have already sent your tapes to me,
my wife is sending them back today (with the data, of course :-)),
for all but about 3 or 4 (the floppies, and RLM's ebcdic tapes))

Anyway, hope this helps.

> think I saw some note about this many months ago. I presume that I
> have the "potted" electronics vintage rig.

The newer (last 6 months or so) Uniden rigs have the PLL/VCO potted in
epoxy to prevent just what you describe. CBers and even taxi companies
were buying them up to run in the "freeband" (aka 27.405 to 28.0 MHZ).
Also, I'm sure your aware that even a HAM cannot legally operate a non
type accepted radio on the CB band.

Having said that, you can still modify the potted radios to cover 26.990 to
29.990 MHZ, but I won't tell you how here.

>There has long been a myth in amateur radio that phone patches (or
>autopatches) cannot be used to evade tolls. It is just that - a myth.
>

Let's not be too hasty with this statement either. It may not violate
Part 97 but that isn't the only law we need be concerned about. I think
you will find that the use of Amateur Radio to evade tolls could be taken
into court under the FTC rules concerning "unfair restraint of trade."

I have long argued that what was legal and acceptable when the Part 97
rules for PATCHING were written are like all the rest of the Amateur
rules, badly out of date and even worse out of touch with reality.
When we were first given the right to do third party traffic including
phone patches the communications situation/industry was very different
from what it is today. There were many aprts of the country that had
no telephone service at all (ie. ALASKA) and in many others the "PHONE"
was a wooden box with a crank down at the general store 30 miles away
in town. During this time hams were a vital part of the nations
communications network. Children attended school using ham radio, doctors
were able to head of epidemics by ordering vaccines over ham radio and people
were able to get in touch with peoplew ho were not reachable by any other
means.

But today things are different. Today you can call anywhere in the world
from the comfort of your living room using the telephone. There is nowhere
(that I am aware of) in the country where phone service is not available
and few places outside the US. It has even reached the point where the
number of cars on the highways with phones outnumbers the hams. Even the
argument about calling in traffic accidents and emergencies is no longer
valid. Most cellular phone companies even offer emergency calls (like 911)
for free to the cellular user. IMHO this makes it real hard to justify
phone patching and in particular AUTO-PATCHING for any reason other than
to get out of the cost of a cellular phone.

Your best bet is to get a replacement battery from a battery specialist
such as Mr. Nicad (E. H. Yost Co.).

Wilson was bought out by Regency a couple of years ago. The new
Regency HTs look just like the old Mark IVs on the outside; I don't
know if anything's changed on the inside or not. If you need replacement
parts, you can probably get them from Regency.

>you can never reuse the PL259
>after you solder those four little holes on the side.

Sure you can! You just need a mongo soldering gun! I use an ancient Craftsman 250W unit. I also use nothing but silver-plated teflon-dielectric PL259s. As a rule, I much prefer type N connectors, but I don't like to modify equipment that comes supplied with PL259s. So, I figure that if I *must* use PL259s, I might as well use the best.

The only problems I've had in soldering to PL259s are with foam-dielectric coax. If you use RG213, RG214, Belden 9913, or some other polyethylene coax, then you won't have any trouble. The foam in Belden 8214, however, tends to expand when heated and it fills the space between the outer shield and the connector body making it difficult to solder. In those cases, I tin the braid before I put it in the connector being very careful not to use too much heat or to let the braid expand.

Only if you live very close to the shortwave broadcast station. These
radios are simple detectors with a one pole filter on the front end, and
no amplifier stages. Thus, a strong local station is all that can be
received.

A dual band radio will work much better for a "simplex" autopatch. You can avoid all that nasty sounding clicking, have 100% control over the phone line 100% of the time, and have full duplex (just like a REAL phone) also. No difference from a "cellular" phone, except you aren't paying through the nose for it, and you can't use it for business use.

The discussion of sources for parts brings to mind another question - can anyone recommend sources for vacuum tube components ? Restoring/building old radios is a growing sub-hobby of mine, and sources for vacuum tube related parts are becoming very hard to find. I'm specifically thinking of things like power transformers, audio output/interstage transformers, IF/RF transformers and coils, high voltage electrolytic capacitors, tubes and sockets, etc...

I'm already aware of Antique Electronic Supply, and while they're certainly a great place, their selection is a little limited. Are there any others ?

re: Dipole antennas and SWR -

The feedpoint impedance of a dipole antenna in "real" applications depends on several factors. If the feedpoint impedance is calculated for the "free space" case - which is never met in "real life" but which may be approached if the antenna is sufficiently far away (say several wavelengths at least) from *all* conducting surfaces, including the ground and supports - we get the "textbook" value of about 73 ohms.

Bringing the antenna close to a conducting plane - such as the ground - or changing the configuration from the "normal" - the two wires sticking straight out from one another - changes the feedpoint impedance and so the SWR. (Getting closer to the ground reduces the impedance, as does switching from a true "horizontal dipole" to an "inverted V" (ends drooping) configuration.) In any event, a dipole (or any other antenna) should always be tuned - in this case, cut to length - in the position in which it will be used. This avoids the problems you've run in to here ("Gee, I've cut it three times, and it's STILL too short!" :-)) Also note that height-above-ground also affects the radiation pattern, as the gruond acts sort of like a reflector - horizontal antennas near the ground shoot more of their signal "up" rather than "out", with a resultant loss in "range" (or signal strength as measured horizontally out from the antenna).

What you might want to do is to mount your antenna, initially, using pulleys and ropes at all support points. Cut the antenna a bit long, then run it up into the final position and check it. Bring it down to cut it as needed, but keep putting it back into place to test it. When you're obtained your best match, you can permanently mount it in the same position as it was tested, and expect very similar readings.

Note also that in this particular design - several dipoles with a common feedpoint - each leg can affect ALL the others, depending on spacing, etc. Be sure to check the performance on ALL bands after trimming ANY of the dipoles. This can be a tricky antenna to tune. I've got one that works pretty well on 15 and 20 though, so keep at it - it IS "doable."

Religious dogma or not, I agree with the original note. The loss issue is probably not the biggest problem at moderate frequencies. But there are several other reasons satisfactory -- to me -- for staying away from "UHF" connectors.

1. They are not weather-resistant. I doubt many if any connectors can claim to be "waterproof" but N and most BNC connectors at least have gaskets.

2. They can't be assembled without intense heat being inflicted on the coax. Foam coax in particular doesn't much care for this.

3. They are inconvenient to plug and unplug (compared to BNC)
(By the way, if you want quick disconnect and high power, take a look at the "C" connector some time. They are unfortunately not common.)

4. They are unnecessarily big (again compared to BNC).

Wherever possible I use BNC connectors. For anything other than microwaves or 1500 W linears that works fine. If I ever get a linear I'll go to N there.

Of course, if you want a real laugh, consider the newfangled crock known as "mini UHF".

Tesla is the SI unit, gauss the (officially obsolete) unit from the CGS system. Why is it still used? Partly because we're in the USA, where the metric system is only barely understood. Partly because engineers and amateurs tend not to care much about consistency in units.

I still remember the grief I caught from my Physics prof. because I had the nerve to write up a lab report on gamma ray experiments with the energies listed in fJ (femtojoules) rather than his pet MeV (megaelectronvolts, a mishmash if ever I saw one).

Does all this matter, you ask? It sure does. I recently tried to read an apparently well-regarded textbook on switching power supplies. The section on inductor design was totally unintellegible. The reason: careless random mixing of units, particularly centimeters or square centimeters vs. "circular mils" [sic].

And I've been using Ethernet coax to feed my 2 meter antenna, even though you're suppose to only use it on computer nets :-) Then again, it's on packet, so that's why it works! :-)

Anyway, I've used Amphrnol (sp) pl259 connectors on the Ethernet coax. The antenna has an so239 connector on it (it's a manufactured DDRR antenna, looks like a hoop about 10 inches across), so I didn't have a lot of choice of connector to use. I could have used something other than a pl259 at the rig, as the rig uses a BNC. But BNCs won't fit Ethernet (the size of RG8), so, it's gonna be an N or pl259. N is obviously better, but I didn't have any. (I use an adaptor UHF to BNC). Any impedence mismatch due to connectors are located at the antenna and/or rig, where other mismatches eighter swamp out or maybe cancel those due to the PL259s.
Soldering these onto coax can be a real pain. I've had to file the plating off around the holes to get solder to stick. And a few times I wondered if I destroyed the dielectric of the coax. Though the foil layers of the Ethernet should help here. And I've salvaged a few PL259s (the better quality ones I wanted to save, like the ones with the tannish color insulation). I heated up the center conductor to unsolder it and to melt the foam, then I pull it out from the back side. Then I can rip out the foam. Then I can rip out the braid. Takes about 20 minutes of cursing to do.

[BUG FOOD] /* sorry, I can't break myself of this habit */

I have a SPECIFIC question: knowing (assuming?) wefax to be:

11 inches long @
75 lines/inch

So we have 825 lines total. However, what I learn from the Advanced License Class examinations tell me only how to receive an ANALOG signal (this stuff is really outdated - receiving fax with moving pencils on rotating drums? History is important, but we're supposed to concentrate on ADVANCING the state of the art) [throwing water on flamethrower]

Anyhow ... so what I will pull off of my MFJ-1274 (or a PK-232, I guess) will be a string of bits (in packages of 8? or maybe 7).

The MFJ owner's manual says nothing about how many bits wide the picture will be -- how many bytes will I pull off before I return to the left-most column? And, if the signal gets trashed by QRM, will the TNC pad the serial link so only part of a line gets trashed, rather than the rest of the picture being malaligned?

Sorry this is so long -- I must learn to be more terse. Please reply by followup message, because I *KNOW* others have these same questions.

The question about carrying your HT onto an airplane is one that comes up periodically, and it hasn't been that long since the last time, so I don't think it's worth a tremendous amount of discussion at this time.

However, a (hypocritical?) note of personal experience is that when picking up Dad from New York's LaGuardia airport, I asked the guy if he would let me through with my 2m handheld, and he said that yes, he would, but he would ask to see my license first. He did not convince me with the appearance of authority on the subject, though, so I suspect that LGA's policy is probably stricter than that.

Chris N2JGW

An unrelated note -
(The observation deck of LGA is absolutely beautiful at night, with the lights of the airport and the city and stars above... it has been closed to the public permanently due to bomb threats).

Rather than going blow-for-blow with John, I'm going to agree with most of what he says. At the same time, I disagree that the current points system reflects reality.

I worked some Health and Welfare traffic to SF after the quake. It made me realize that to be effective, I had to dump the "hobby" attitude and be more professional ("dedicated", as one of the local guys puts it.)

For example, it's true that you can run a QRP station longer than a KW station. On the other hand, if the majority of the country doesn't hear you, or you can't reliably communicate with most areas of the country, QRP is not useful. At the same time, it's pretty easy to siphon gasoline out of the RVs and trucks, and not run out of gas. I found that passing traffic on 40 meters with the 80W PEP from my old TS520 just didn't quite cut the mustard. The same was true for the traffic handler in Alemeda, CA. A kilowatt on both ends would have made everyone's life easier.

John is also right about being able to set up a field station. On the other hand, I was talking to a guy that had access to a telephone (i.e. at home), so both environments are useful. Local traffic was handled on 2 meters, and long-haul was on HF. So, why is there an extra multiplier to set up a field station ? Fresh air and sunshine ?

John is also right about not building your own equipment when all you really have to do is store spare radios somewhere. I suppose I could concede my radical stand on going to the mountaintop with a portable tribander. On the other, wire antennas will always be there because of the simplicity. Again, there is no multiplier for not using a rotatable beam that turns on 110v juice. Using a 1000' wire tossed down the slope gets my respect, but somehow a tribander does not. Maybe its because I don't have a beam at home.

Other miscellaneous amusing stuff from John's note:

>Hey, real disaster-relief agencies plan their simulations ahead of time!
It was clear from my SF experience that things are awfully
confused in a real disaster. Even simple things like finding
someone in the disaster area that has a radio and can control
a frequency is a major undertaking.

>What, you should get an extra multiplier if you didn't enjoy yourself?
Heh, heh. Let's not get too "dedicated" here, ok ?

>I can understand the SWR
>low point shifting when the antenna was raised. I can't understand,
>however, why the SWR low point is no longer low. Can anyone help?

I always thought freespace dipoles had an impedance around 75 ohms. My guess is that the interaction of the antenna with the ground caused more ground loss, which lowered the impedance to 50 ohms. Raising the antenna lessens ground loss.

> patch on 2 meters. It would cover only about a 2 mile radius.
^^^^^^^^^^^
> My first question concerns the legality and accpetability of this.
> Of course, I would make certain the freq is not used by a repeater,
> or packet or any other group.

>From: tad@ssc.UUCP
> Legality of this setup is questionable.

A simplex phone patch will consist of a TRANSMITTER (at the base) which is under REMOTE CONTROL by whoever is accessing the patch (usually at a remote location). FCC rule 97.213(a) specifies that remote control of an Amateur Station by radio must use an auxiliary station. In other words, you are operating an auxiliary station when you are remotely accessing the patch. FCC rule 97.201(b) specifies that an auxiliary station may transmit only on the 1.25m and shorter wavelength bands except 220.0-220.5, 431-433, and 435-438 Mhz segments.

>From: hendrick@frith.egr.msu.edu

> can avoid all that nasty sounding clicking, have 100% control over the
> phone line 100% of the time, and have full duplex (just like a REAL
> phone) also. No difference from a "cellular" phone, except you aren't
> paying through the nose for it, and you can't use it for business use.

Sounds like a good solution to me. To make it legal, be sure the CONTROLLING station is transmitting on UHF or 220 and the base station is transmitting on 2 meters. The other way around would be violating 97.201(b) and 97.213(a) by operating a remotely controlled amateur station by other than an auxiliary station on frequencies authorized for auxiliary stations.

Simplex autopatches are quite tempting, and simple to set up, but NOT LEGAL on 2 meters because it would be REMOTE CONTROL via 2 meters. Taking the dual bander approach makes for a better patch, and gives you the chance to easily make sure it is legal.

> the call the rest of the FD group is using.

Suppose the novice station is operating 10 meters and at a different time, the regular FD group operates 10 meters, AND several stations worked are worked via BOTH CALL SIGNS. Do both sets of contacts count (they would for the other guy since he has no way to know) or do they have to be DUPped?

Generally most hams have not had much trouble, but there are some isolated incidents.

What I do is disassemble the HT from the battery pack, cover the contacts on the batteries (fully charged) with electrical tape to prevent accidental shorts and possible fire. I pack the components apart, but in the same suitcase (I only carry one). I've run it through X-ray and never been questioned or stopped.

DO NOT EVEN THINK OF ACTUALLY OPERATING THE HT ON BOARD THE AIRCRAFT, not even to listen. Walkman type stereos have been said to affect some navigation equipment. Maybe the walkman was at fault, but don't take a chance that it wasn't the nav gear.

>At anything above DC, the PL259 is horribly lossy and non-constant-impedance.
>Unless you tighten them up real tight (like with a small pipe wrench!) they
>unscrew themselves and oxidise after a few years.

I've found that not only does a PL259 work reasonably well at audio
frequencies, but I've even used it up to VIDEO frequencies without a
significant degradation of signal quality. After spending 45 minutes
apiece getting the darned things soldered right, they better work.

I just recently obtained a Larsen Antenna catalog and notice they have a
variety of connector types. Sure, PL's are listed first, by THEY DO make
BNC's, N's, and even TNC's available.... EXCEPT on their VHF/UHF duplexer.
OK, so I called up Larsen and asked them why they don't make it with N's
or even BNC's. They said the unit would end up costing $150 (with PL's it
runs about $50) and they could not sell it at that price. I've see type N
connectors for chassis mount like they would need to use run for $10 or less.
Since the 3 connectors must be costing them $100 more, that's $33 apiece more
than PL's. Then someone must be PAYING THEM $23 apiece to use their PL's.

At least with the latest teeny-tiny breed of Japanese radios, they've had
to pigtail the RF connector and run a short coax lead out the back of the
radio where they stick on an SO239 type connector. At least they are making
it easier to put a decent connector on.

TNC connectors are being used for cellular telephone systems at 800 Mhz.
Why not the cheaper PL connectors if they are just as good?

Ethernet specifies type N connectors (BNC for thin) even at relatively lower
frequencies. Things would surely have cost less of they had used PL's.
Then even Radio Shack could sell Ethernet parts.

I've now walked on to four different flights with an HT on my hip, with no problems. I send the HT through the Xray machine on top of my carry on baggage. The first time I tried, I expected some hassle, and sure enough, the security guy asked to see the HT. It turns out, he has a Novice license, and had never seen a IC32 up close before.

No, Max isn't an SK. He's still puttering around, kind of like manager emeritus; when Madison moved a couple of years ago (to make way for the George R. Brown Convention Center), he ran the final cleanout of the building.

Yes, he does have an amazing memory.

3656. Contest log program?

Newsgroup: rec.ham-radio
Date: 1989-10-31 10:39:09 UTC
From: so-luru@stekt.oulu.fi
Message-ID: <SO-LURU.89Oct31123909@stekt.oulu.fi>
Source record: 15836

I would like to know if there is a proper CONTEST LOG PROGRAM
available somewhere.

The program would have to be EASY TO USE, it would have to recognize
the rules of all the major contests, it would do real-time dupe
checking, it would preferably use the computer's real time clock. It
would also be easily configurable for new countries, unknown prefixes,
or the change of rules...

Of course, the program prepares logs, dupe lists, and some neat
statistical information for you (in real time). The user interface
would of course be SIMPLE and FAST.

I know there is ONE beast that meets ALMOST every one of these
criteria (it doesn't use the computer's real time clock..), and I am
currently using it. It would seem that I would be a happy contester,
eh?

Well, actually, I would like to see what kind of competition there is.
Plus, I think I've found a major bug in the software (or, then, it was
only the goddamn RF in the shack..).

The one I am using is called HAM - The Contest Manager - and it is
programmed and marketed by OH2BQS. Other than its *very* few
shortcomings, I actually LOVE the program.

But, as just said, IS there anything else?

RTTY DX Notes for Week Ending 27th October 1989
BID: $RTDX2710
Part 1 of 2.

It seems with the auroral flares earlier in the week band conditions
took a dive. But in some areas there appears to have been some
improvement later in the week, though from where i write these notes,
conditions remained in a very poor condition. But hope springs eternal,
so maybe next week things will improve.

Our thanks this week go to DU1AUJ, G3XTL, TG9VT, VE3JPC, VK2EG, W1DA,
N2HOS, W2JGR, W0LHS. Thank you all for your assistance.

TZ6VV 14091 at 2237Z

QSL Information.

S92LB is very active at the moment, and will QSL via DJ6QT.

9K2DR will collect his QSL cards from Box 17313, Khaldia, Kuwait 72454.

N2HOS has informed me that he has finally agreed to be the QSL manager for TU2BB, after some confusion.

3D2GD cards go to OH3GZ, as will cards for A35, 5W1 (if they operate there), and ZK3.

C6A/G0AZT cards go to Eddie's home address of Box 5194, Richmond, CA 94805 USA. No, he does not live in that box, just collects his mail from there.

TZ6VV will QSL via N0BLD. Larry has a three year contract, so his signal should be around for some time.

INFORMATION OF INTEREST.

Anyone waiting for the A61 operation to start on RTTY, forget it. Their RTTY gear did not work.

OH2BGD and group should now be on 5W1, and from the sounds heard, they do not plan any operation from that area. The next signal that you should hear will be from ZK3 from 4th November, if they can find a boat going that way.

EA9JV reports that if his employer will give him some leave, he will be active from Western Sahara from 13th to 16th November. This will be an RTTY only operation. QSL for his S0/EA9JV to his Callbook QTH. He has his flight tickets already. Lets all hope that his boss is a kind man.

Ontario amateurs may use the special prefix of XL3 from October 24 to November 24. This is to celebrate the 350th anniversary of the first European settlement in Ontario.

Bouvet should be activated in February by a DXpedition who will operate RTTY only.

GL DE DX1.

>from the comfort of your living room using the telephone....

You obviously haven't tried to call a "third-world" country such as Nigeria. My wife once spent several WEEKS trying an HOUR each night to call me there from the USA; a particularly-helpful (and talkative) US telephone operator once laughed and told her "You can't call Nigeria; their operators don't even answer the phone!" The net result: in weeks of trying she ONCE got an operator in Lagos--who promptly hung up the phone!

Within Nigeria itself most phones did NOT work, the police did NOT give out their phone numbers, a call from one town to another (such as Lagos to Benin City) was difficult, and a call OUT of the country took several hours of trying by the phone company's own operators (who often did not succeed).

Of course, in the USA, things ARE different. Viva la difference!

The best reception of FAX I have seen that uses a dot matrix printer is with the InfoTech (DES) M-800v2 (which I have). Universal Shortwave now sells a unit called the M-900 which combines (I think) RTTY/CW/?/FAX into one small unit. The FAX goes to the printer. For FAX reception, it has the ability to responde to the START/STOP tones, set frames of 576 or 288 IOCs, speeds of 60, 90, 120, and 240 lpm, can do black/white OR 16-shade gray-scale, print the image Right-Left (normal) or Left-Right (like a photo negative), and can either print in a POSITIVE mode or a NEGATIVE mode (which photo negatives are sent in, and which comes in handy for manipulating clarty of weak or noise images). It has BOTH and AM (for FM broadcasting satellites), and FM (for shortwave FAX stations that very the audio frequency) demodulators. In short, it carries the tuning of a FAX signal to the hilt and generates a beautiful representation on my epson-clone 24-pin printer (does a great job on a 9-pin too).

I don't work for Universal. I just really love the unit. I believe it sells for $250-$400 now (not certain). It is a standalone unit, now computer or program needed. Just mu $.025 worth.

Mark.

From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <177798@Wayne-MTS>
Source record: 15834

I have found the simplest way of installing 259s to be:

-Strip about 2" of insulation;
-Tin the braid using a *big* iron (work fast)
-Cut the braid to length using a pipe cutter
-Cut the dialectric to length
-Scrape foil shield, if any
-Solder.

A caveat for those using paste flux: Even though it says "non-corrosive", it ain't. The stuff is very hydrophalic, I'm told, and you end up with a very corrosive compound. If you do this, wash the connection with a good cleaner.

I've been using CATV RG-6 and F connectors lately for low band, and I'm pleased with the results (running 10-100W). For crimp on connectors Fs are great, and the cable is waterproof and can be buried. I have not, however, seen a crimp-on 259 that seemed decent. Stick with teflon/silver and solder.

Re proper irons for soldering 259s: Back when all hams used a 150W American Beauty for their soldering there was no problem. Today you've got to look to find an iron that has not only enough wattage (45 is enough, really) but more importantly enough thermal mass. My favorite is a 50 Watt chisel tip that's about 1/4" in diameter and 2" long. For outdoors use, the cheap Radio Shack butane torch with the soldering tip is fantastic.

Agreed.

The real joke is that I think the so called "UHF" connector isn't even
50 ohms. [Granted, the size of the connector is small even at UHF so
it doesn't matter]

Give me a BN or N anyday.

Bels, Millibels, Decibels, Nepers - well I'll look in my 'Handbook of Wireless Telegraphy' (2nd edition 1923) when i get home. One thing i do recall is that until about 1930, capacitance was measured in terms of units called 'Jars'. There was also a unit called a 'Mic' which i think was used for inductance. Again, my trusty ancient volumes will reveal all.
All 'obscure' areas of science have their pet units - if you measure the call-handling capacity of telephone switching systems you come across 'Erlangs'.
(Now theres a good one to use down the club next time - 'My TNC has a switching capacity of 17 milli-erlangs!' HI HI)

Also, back in the 'good old days' we used to measure the 'slope' of a tube in 'Mhos', this being 'reciprocal ohms'. 'Slope' is Mutual Conductance (milliamps per volt). 1mA/V is 1000 micromhos!

Bill, I can't explain why you never had a problem with your radio.
All I can say is that I went over everything, made sure all the component
values of parts around the driver & PA were still correct, made sure
everything was connected correctly, made sure the stages were properly
aligned, and so on. Yet I was unable to make the Ip dip and the Po peak
coincide, for ANY amount of Cneut (read that 0 - 100 pF). I was also
similarly unable to minimize the driver feedthrough with the plate and
screen disconnected. So, please tell me what you did (of what I
didn't do) to make it neutralize properly. I'd really appreciate
that much more than simply being told that the procedure works.

BTW: I tried to respond directly but had path problems. Sorry.

Yours, etc.,

I already received some responses --- Thanks.
I am posting again to bring it to your attention that when I asked for
the above info., I was really interested in logging transmissions in
various languages beamed TO OTHER CONTINENTS by VOA or BBC. It is quite
easy, even for a novice like me, to tune in English broadcasts meant
mainly for North America. With the help of the list posted by Mr. Brown
I was able to listen to Urdu broadcasts by VOA, for example,
particularly well, above 17000 khz. I have had worse luck with Hindi
transmissions, though. Anyway, a similarly detailed list for BBC would
certainly help. I have a modest digital receiver and a random wire
indoor antenna at this time. Is it worthwhile to still try on ?
Thanks again, to so many helpful netters out there.

First off, I happen to share John's interpretation of the existing rules. Secondly our service is governed by the FCC not the FTC in the general case, so I'm not nearly as worried about FTC rules applying to my on-the-air operation as I am part 97.

In practical terms both the FTC and the FCC have more important fish to fry than this particular issue. Heck, for that matter its rough enough to get FCC to pay attention to the real enforcement problems that hams have that we can't deal with ourselves.

3672. Looking for Zenith TV part

Newsgroup: rec.ham-radio
Date: 1989-10-31 17:45:09 UTC
From: barry@hprmokg.HP.COM
Message-ID: <13770039@hprmokg.HP.COM>
Source record: 15837

I realize this is not related to ham radio but I believe that a person
having the answer to this quesiton probably reads this group since
many hams are "hardware hackers".

I'm fixing a TV to repay a favor to a friend of mine who lugged
the contents of my old house upstairs to our present home.

Here goes...

I'm looking for a voltage dependant resistor (VDR) for a Zenith 19DC22
Chassis.

The part is about the diameter of a nickel, about 3/16 inch thick and
looks much like a thermistor would. It's coated with red epoxy.
I do not have the Zenith part number. The part failed by arcing across
the body and blew out the tripler with it.

The component connects in series with a focus voltage tap coming from
the high voltage tripler. It is mounted on a terminal strip behind the
flyback transformer. It apparantely is used to automatically adjust
brightness of the raster with high voltage fluctuations. The low voltage
side of the component connects to the brightness limiter potentiometer,
with another series resistor and zener diode connecting to ground for the
voltage ref. of the control.

I have tried talking to two Zenith dealers in the area and they are no
help (the set is about 15 to 20 years old).

Any help on the net I can obtain in either getting the part, finding a
source for the part, or its part number would be greatly appreciated.

Please e-mail your response.

Thanks,
Barry

Memory, that semi-volatile substance we all posess tells me that in the late 50's, Emerson made an eight-transistor radio that sold for about $88.00 whose model number was (natch): 888. A friend of mine had one, but his daddy was a physician while mine was only a bricklayer.

You can quote me, but don't put any money on me! Does anybody else remember that radio, and am I right about the price? They had nice pastel cases in the era's popular colors, you know, like aqua, lime, peach...

Jim (and net...)

I have successfully carried my IC2aT and IC4aT in my briefcase, no questions asked between Dallas and Pittsburgh. They haven't even given me the expected warnings about not using it on the plane! Be prepared to (1) demonstrate that it *is* a radio and not just a shell containing boomstuff...(usually just turning it on and opening the squelch is enough) and (2) listen to a lecture about not operating on the plane. (usually something the security guard has memorized.)

I doubt if they'll go as far as to ask to see your license, but ya oughta have it with you (or a copy) at all times anyway.

I save the little cardboard inserts that come with the battery packs (do Kenwood and Yaesu and others have those?) and break the thing down when I put it in the briefcase. That may be irrelevant.

Good luck, and happy travelling!

As far as I am concerned, there is only one real-time, DX contesting computer program worthy of consideration: CT by Ken Wolff, K1EA. A C program written for XT/AT type machines, it currently handles CQWW, ARRL DX, CQ WPX, WAE and ARRL VHF contests. The program is being made available by the Yankee Clipper Contest Club for $25 US. My understanding is that the club take a $5 cut from each unit sold and uses the rest of the money for distribution costs, laser printing of manuals, etc. I believe the club's contact person for information and orders is KC1EO, via his callbook address.

...
>Now that I'm getting back into it, I really miss my old call. Is it possible
>to get it back ?
...
>N4CDO (ex WB4QVO :-( )

Well, I'm sure I'm not the first to answer "no" to this question, that the FCC does not re-use callsigns in any way once they've expired.

But, with more than half of the callsign districts in the US either out of or NEARLY out of (2-land is up to WU2? from what I hear), it seems pretty obvious to me that this is a stupid policy.

I don't think that amateurs should ever be allowed to pick their own callsigns (e.g. cute acronyms or initials or something), but if I had designed the world (why didn't they ask for my help?) I would allow defunct hams to regain their old callsigns (within a certain amount of time, perhaps), and I *certainly* would reissue defunct callsigns once a group runs out.

Not that I have anything against AA calls, but what happens when THEY run out? A short nifty little callsign would be worth the work at 20wpm, to me.

Chris N2JGW (tongue-twister callsign on voice modes)

3680. MODIFICATION for BC 100 for AM/FM on all freqs.

Newsgroup: rec.ham-radio
Date: 1989-10-31 19:50:56 UTC
From: fisher@minster.york.ac.UK
Message-ID: <swordfish.625866658@minster.yoro.ac.uk>
Source record: 15843

The Uniden Bearcat 100 XL is a beautifully made receiver which covers 66 - 512 MHz (with gaps). It can receive both AM and FM signals, but you cannot select which you want: the receiver selects AM on the air band (118 - 136 MHz) and FM everywhere else. The following simple modification will allow you to select AM or FM independently of the frequency, by means of a 3-position switch. The three settings are: AM; FM; auto. (viz. AM on the air band, FM everywhere else).

Remove the battery cover. Unplug the ribbon cable at the bottom end of the receiver, and pull out the microprocessor (uP) board, which is also the front panel. Label the 12 wires of the ribbon cable 1 to 12, starting from the left, with the component side of the uP board towards you. Wire 2 is Vcc (about 7 V), wire 12 is ground, and wire 8 is the signal which goes from the uP to the receiver board to select AM or FM oteration. It is 0 V (or open) for FM, and Vcc (approx.) for AM.

Unsolder wire 8 from the board, removing e|cess solder with a solder-sucker or wick. Obtain a single-pole change-over toggle switch with centre "off", and connect as follows.

```
from wire 8 on uP board ______@
@---@_____ to wire 8 on Rx board
from wire 2 on uP board (Vcc) ______@ (AM/FM select)
```

Use heat-shrink sleeving or plastic tape to insulate the connections.

The switch can be mounted on the battery cover, or perhaps -- if you can find a small enough switch -- on the top panel, next to the "lock" switch.

I've done it and it works.

I hope I am not making a mistake by posting it, but I think that it is VERY important. It just came through packet, and I gated it to usenet right away, so I'll hope that multiple copies don't appear; if they do, I apologize, but, as I said, I think this is important:

From: N4WBO@WB0TAX
Subject: FCC LETTER PART 1

Path: WB2VPH!KC3BQ!WA2TVE!WA2UMX!WA2PVV!WB0TAX

THIS LETTER WAS DOWNLOADED FROM COMPUSERVE, IT
PROPORTS BE A COPY A LETTER SENT BY THE FCC TO
SELECTED HAMS ACROSS THE COUNTRY.

PART 1
This is the text of the letter that the FCC mailed to
numerous participants in 20 meter net activities.
- - -
FEDERAL COMMUNICATIONS COMMISSION

Dear Mr. [amateur's name]

This letter is being sent to you because you may be serving in an inluential position with respect to third party telephony traffic, information bulletin or telegraphy practice communications transmitted on the amateur service HF bands. You may possess, therefore, information and insight that could help bring about a resolution of the unfortunate continuing over-the- air dispute that takes place on the amateur service 20 meter band. A similar letter also is being sent to other amateur operators and organizations who may be of assistance.

We fear that enhancement of international goodwill -- a fundamental principle of the rules for the amateur service in the United States -- is being jeopardized as a direct result of this dispute. We are concerned, moreover, that the experimental nature of the amateur service is being suppressed. When a channel is used to carry on a never-ending debate, it is denied for the purposes for which the frequencies were allocated. Finally, requests to the Commission to resolve the dispute are diverting far too much staff time from other essential activities.

The Commission has, on numerous occasions, provided guidance to amateur stations conducting third party communications. In the Report and Order in PR Docket No. 88-139, for instance, the Commission concurred with the American Radio Relay League's observation concerning the proper balance in the rules between the flexibility to achieve the objectives of the mateur service and the degree of protection necessary to prevent exploitatio of the service. The amateur service should be allowed to utilize its allocated frequencies unfettered by encroachment from commercial entities. It should not be allowed to be exploited by those who would use them as an alternative to the land mobile, broadcast, maritime, or common carrier radio services.

For the above reason, Section 97.113(a) of the Commission's Rules, 47 C.F.R. Part 97.113(a), prohibits an amateur station from transmitting any communication the purpose of which is to facilitate the business or commercial affairs of any party. No amateur station shall transmit communications as an alternative to other authorized radio services, except as necessary to providing emergency communications under Sections 97.401-97.407 of the Commission's Rules, 47 C.F.R. Part 97.401-97.407. In the Order adopted June 29, 1983, 48 Fed. Reg. 32999 (1983), the Commission stated that the term "business" in this instance, is used in the broadest context. It includes all types of communications which are intended to facilitate the regular business or commercial affairs of any party, whether individual or organization, whether for-profit or not-for-profit, whether charitable or commercial, and whether government or non-government. By Public Notice titled Amateur Service International Radiocommunications dated September 1, 1989, the Commission further elaborated upon the scope of Section 97.113(a): All types of communications relating to business activities, including the advertising, soliciting, ordering, furnishing, delivering, accounting, or billing of any supplies, materials, or services are prohibited.

Although Section 97.115(a) (1), 47 C.F.R. Part 97.115(a)(1), permits an amateur station to transmit messages for a third party to any station within the jurisdiction of any foreign government whose administration has made arrangements with the United States, all international communications by amateur stations are subject to Section 97.117 of the Commission's Rules, 47 C.F.R. Part 97.117, which limits amateur station transmissions to a different country to messages of a technical nature relating to tests and to remarks of a personal character for which, by reason of their unimportance, recourse to the public telecommunications service is not justified. This rule conforms to the internationl Radio Regulations applicable to the amateur service.

Considering the above limitations, it is not apparent why there should be any significant amount of third party communications transmitted in the amateur service. It appears, however, that as much as 15% of the 20 meter band is being claimed for such communications by some amateur operators and by organizations apparently organized specifically to utilize the amateur service for third party telephony communications. The justification for any such entitlement, however, has not yet been made to the Commission. Nor does it appear, as evidenced by the presence of the on-the-air dispute, that any such privilege claim has been accepted by the entire amateur community.

Our approach has been to allow the amateur community to resolve the issue in a spirit of cooperation, as it has for many issues several times in the past. Because this approach has not been effective in this instance, we are looking to other alternatives. One alternative approach may be rule making that could range in outcome to an outright ban against all third party traffic to the designation of specific channels in some segment of certain amateur bands where only third party telephony communications could be conducted. Before taking so drastic a step, however, we want to gain a better understanding of the issues behind the dispute.

We request your cooperation in resolving this matter. We therefore ask that you submit a report to us on the matter by November 15, 1989. While the submission of the report is voluntary, failure to submit it may mean that we have to proceed without the benefit of your expertise. Your report should include the following information based upon your personal observations during periods when the amateur service is not generally being used to provide emergency communications under Subpart Ef Part 97, 47 C.F.R. Section 97.401-97.407:

(1.) Is there, in your view, a channel plan? What is the channel plan for the analog emission segment of each amateur service HF band? What is the channel spacing? How many channels are utilized for telephony in each band?

(2.) How many channels in each analog emission segment are used by Commission-licensed amateur stations for domestic third party telephony communications? What is the general nature of these communications? How many phone patches are transmitted per channel per day? What effect does the transmission of such communications have upon the amateur service? Why isn't a public telecommunication system, maritime service, or other radio service used for such communications?

(3.) How many channels in each analog emission segment are used by Commission-licensed amateur stations for international third party telephony communications? What is the general nature of these communications? How many phone patches are transmitted per channel per day? What effect does the transmission of such communication have upon the amateur service? Why isn't a public telecommunication system, maritime service, or other radio services used for such communications?

(4.) How many channels in each analog emission segment are used by Commission-licensed amateur stations for information bulletin telephony communications? How many amateur operators listen to one of these transmissions? How many information bulletin communications are transmitted per day? What effect does the transmission of such communications have upon the amateur service? Why aren't amateur digital systems used exclusively for such communications? What stations transmit such bulletin type messages? Is the transmission of such messages desirable or necessary?

(5.) How many channels in each analog emission segment are used by Commission-licensed amateur stations for telegraphy practice communications? How many persons make use of these transmissions for telegraphy practice? Why is an analog emission segment used for such communications? What effect does the transmission of such communications have upon the amateur service? In view of the availability of recorded telegraphy training material, why are amateur service frequencies still used for this purpose?

(6.) Please suggest a statement of practices that you believe should be followed by amateur stations transmitting third party communications, information bulletins, and telegraphy practice. Comment on whether the amateur service can voluntarily adopt your suggested practices, or should Section 97.101, General standards, 47 C.F.R. Section 97.101, be expanded.

Please feel free to provide any other factual information that would assist in a more complete understanding of the issues involved in the dispute. An envelope is enclosed for your reply.

Thank you for your cooperation.

Sincerely,

Robert H. McNamara
Chief, Special Services Division

Did anybody see the new toy for little ones, called "Hide n Seek" ?
It consists of a transmitter and a receiver, which beeps faster and
faster as it nears the transmitter. I guess that it operates on
the assumption that the transmitter is of a known power, and that
there are no ... er ... "attenuating circumstances". With those
assumptions, a simple S-meter sort of thing at a particular freqency,
driving a piezoelectric beeper or something ... kinda neat, huh?
Sort of a high tech version of a very old game, that ham-parents
will love :-)

It may cost less as well to go dual-band.
Commercially made simplex patches can cost over $500... more than that
second radio.

>built-in sample and hold, and can convert at around 20,000
>samples/second.

Your symptoms are definitely those of a missing sample/hold amplifier. I
was building a data logger using a 12-bit, 70 kHZ ADC (back in '82 when 12-bit
A/D was hard to do cheaply) and I was having severe noise problems. I was
getting only 8 of the 12 bits reliably. I sent the ADC back with a complaint
(it was a $135 hybrid module). They couldn't find anything wrong but sent me
a new one anyway. It failed too.

That caused me to look at my design more closely, and I found that I had
omitted the sample/hold capacitor (the app note made it look optional). I
put the cap in, and I had 12 bits of A/D again. How embarrassing. :-(

If the ADC doesn't have sample/hold, and you can put in one that does, by
all means do so. I wouldn't trust an ADC at anything close to the Nyquist
limit for your input data without sample/hold.

Much of the US is not covered by cellular phone service, and even if this
situation should change, are you arguing that a cellular phone is a
vital piece of equipment for your car? I ride a BMW R90S bike a my
primary form of transport, and hooking up a cellular unit on that would
not be a fun time. I think it strange to say that a radio costing $300.00-
400.00 should not be allowed to be used for emergency communications, rather
you should be forced to spend $900.00-$2000.00, plus $35.00 per month
to get access to emergency services.

And what is wrong with using autopatch for "experimenting"? Thats what
this radio service was invented for!

Now hol' on thar! *I* pronounce it "dee bee", and I *know* that it means
one-tenth of a bel. How one pronounces a unit often has more to do with
convenience than with knowledge of the underlying unit (just TRY to tell
me you've never referred to a "5 puff capacitor" :-).
>

Source record: 15866

If the cellular companies don't charge for 911 emergency calls, then it is not avoiding a toll call to make an emergency autopatch. Since I don't make phone calls from my call for anything routine, I personally have no need of a cellular phone. I don't anticipate emergencies, but I also believe that having an autopatch ready just in case is simply a prudent measure.

Now if the cellular companies would accept a 911 call from ANY CELLULAR PHONE, whether it was registered for service with them or not, FOR FREE, then I might consider picking up a cheapie if I ever find it; I don't care to pay their monthly charges just to be able to handle an emergency that I can deal with on my own using few fewer resources and costly far less.

If you call 911 from a cellular phone, I assume you get the 911 service local to the cell you are in. I'm curious how they hand that off.

I ran across this in an archived file. Maybe you'll enjoy it as much
as I.

CODE ODE
by
Troy Weidenheimer, W0ROF

It's more than dots and dashes,
It's a place.
A sanctuary for those who've learned
To love the mysterious magic of
Thoughts arriving in mile-long strings
On roads of ether or wire

Even more, it's peace,
A shield from the disordered sounds
Of traffic, angry people
And industrial clutter clatter,
Within its warm mantle
We find soothing respite.

And the patter of bright ideas it is,
The sharp focusing of others' thoughts
From miles beyond our vision's range.
As in a dream we sit so still.
It floats in ours ears and stirs our minds
With concern, remembrance, speculation
And mirth

And code is music,
From sounders and speakers it dances
In the shack to each sender's inner clock,
And comes butter smooth, deliciously swinging
Or choppy staccato from a "fist" praising definition,
Or perfectly metered, flowing exquisitely
From the gentle hand of an artist.

A place,
And peace,
Intelligence and
Music.
Code is more than dots and dashes.

Source record: 15856

Date: Monday, 30 October 31, 1989
From: Sherebrin@UWOVAX.UWO.CA
Subject: Fatigue failure in aluminium towers

I have just discovered cracks in my 40 foot aluminium tower. In one location the tubing at a cross strut weld opened and a crack has propogated down the tube (1.25 inch outside diameter) about 12 inches. The second failure is also at a weld. It appears to be a clear torsion failure.

The tower was made by Heights Manufacturing in Almont Michigan and installed by me 18 years ago. Has anyone had similar experiences? Is it safe to leave the tower up after having the cracks welded by a professional? I am worried that the aluminium may have become fatigued and repairing these spots may only result in failures in other locations. Any comments would be greatly appreciated. 73 and thanks,

> DXers would be willing to pay for calls like W6DX, K6AA, etc?

Well, the ARRL could have still done it under the concept of callsign identification coordinator, who would have processed the requests for callsign SELECTION, and then forward the paperwork to the FCC (along with a significant portion of the fee to help George Bush bail out the federal deficit :-) who would then enter into the computer (or read the computer tape or floppy disk) and file the paperwork.

> Does anyone suppose there's any prayer of resurrecting this
> planned program? I mean, with computer databases it's not all
> THAT difficult, and just think of the juicy call signs that are
> available--check out the Silent Keys list in QST every month!

I think there is hope. If the licensing fee happens, then that is good enough reason in my book to immediately try for it again, but that the FCC should do it with a fee that covers all the costs.

> I agree with the previous writer that the present policy is
> stupid--not only will we run out of Extra calls, but we'll run of

> with clunky 2x3s, and in the limit, ALL new calls will be 2x3s.
> And meanwhile there will be THOUSANDS of calls sitting in the
> database because the FCC is too understaffed to handle the task.

There is also hope that the FCC could re-use old calls, even if they are just chosen in sequence. All those retired (and SK for many years) W6ABC and K6ABC calls could be used. Also for Extra, there are many 1x2's no longer in use. That could be petitioned NOW if someone can be creative enough to justify it under the demise of PRB-3.

I also note that in the table of calls, AA1AAA and NA1AAA (the latter probably reserved for the ORIGINAL "Communicator" attempt) type calls are NOT included as part of assignables. While Novice calls seem to still have plenty of supply, Tech through Extra do seem very finite and it would be prudent to reuse them.

I've walked onto flights with my STS 7600 (an aircraft transceiver) and
with my ICOM 32AT. Generally, security will question it, simply to
verify that it is in fact a radio and NOT a cache for drugs. In one
instance, they asked me to "make it work". I turned it on and turned
up the squelch, which satisfied them that there wasn't anything "extra"
inside the case (like plastic explosives or a gun, I suppose). In any
case, it is NEVER a good idea to operate a handheld on board an aircraft....
Do YOU want to take the chance of affecting the nav equipment of an
aircraft when you're not on the ground???? I don't....I'm a pilot....
I know better.

SUBJ: SASEs for QSL

In reply to Bob Parnass' item on QSL cards needing SASEs---
Yes, you are right on. I have collected cards for awards for years and
have the five-band WAS and five-band-DXCC awards on the wall as the result.
The magazines say that a person needs to send a "green stamp" ($1) or
three or four IRSc and a self addressed envalope to a DX station! That's
nearly five bucks a card for the IRCs and sometimes overseas operatlors
get in trouble having US cash sent to them. Having been DX myself (I am in the
armed services and lived on Johnston Atoll as KJ6DL and on the Azores as CT2BC)
I found the self addressed envalope saved me the most time when I got thirty
to fifty cards in my mail boz most days!!! I didn't care if I got the
IRCs or stamps...it was just the time saving device of the addressed envalope
that caused me to reply to a QSL direct or throw it into the box going to the
buro at the end of each month...as for USA QSL cards...ALWAYS send the
SASE...its the difference between getting a card or not!!! Besides,
adding the quarter stamp is a heck of a lot cheaper than 4 IRCs.
73,

The FCC has recycled old callsigns in the past; that's how I got my
present one in 1971. I expected to get a WB or worse call when I
moved to 9-land, but was pleasantly surprised. I've never found out
who had W9MKV originally. It's much nicer than my original call,
K4VHJ, which is hard to pronounce.

AA0A told me that when he first got that callsign, he had a hard time
convincing other hams that it was for real! :-)

>Now if the cellular companies would accept a 911 call from ANY CELLULAR PHONE,
>whether it was registered for service with them or not, FOR FREE, then I
>might consider picking up a cheapie if I ever find it;

They do. In every area I've ever had my cellphone in, both carriers take
911 calls regardless of the calling unit's status.

>If you call 911 from a cellular phone, I assume you get the 911 service local
>to the cell you are in. I'm curious how they hand that off.

It's easy. You tell the 911 operator where you are and she/he routes it
appropriately.

I avoid autopatches and use the cellphone for emergencies because:

It works every time.
The signal quality is almost always good
The channel is full duplex.
I don't have to worry about intermod or some idiotic geezer who transmits
before listening comming in and wiping out my comments.
I don't have to play 40-questions with all the lurkers after I finish.

John

>Nobody used bels either. But everybody used decibels about sound levels.
>And volume was something we measured in cubic meter.
>Which leads to the next interesting question: Why is sound level or
>sound level control called 'volume?'

That's easy. The control varies how many cubic feet of sound get produced
by the speakers. Didn't you know that the standard bell (of the church
variety) held about 1 cubic foot? Or that the home version was about
a tenth as spaceous, ergo the decibel? Of course, if you have a hundred
or so of these decibels, the great pressure of the large volume
of sound, especially the higher density sounds, can cause damage such
as cracked plaster, damaged ear drums and so on.

Oh yeah, ... :-)

Message-ID: <5858@shlump.nac.dec.com>
Source record: 15881

I've taken my handheld with me on every trip (business as well as pleasure) in the US, plus a couple of international trips. I've never had any problem or hassle. This includes one trip through LaGuardia airport, so I suspect that the bad experience reported earlier was just one guard having an obnoxious day. The radio comes in the carry-on baggage. Usually it passes through the X-ray without comment. About 20% of the time it is looked at. Sometimes I'm even asked what it is. (The answer: "a radio".) On a single occasion I was asked to demonstrate that it was a working radio, so I just turned the squelch back and turned on the power. "Hisss......" -- that was all it took.

By the way, I don't think it makes sense to ask for permission. You don't NEED permission, any more than you need permission to carry on a toothbrush. However, by asking, you're inviting the askee to say NO. Often they will, since that's the easiest answer. By not asking, you're not exposing anyone to the temptation to say no.

I've unearthed what appears to be a good loaner rig for a new novice here, but don't have schematics for it so I can repair it easily. It's a CONAR model 500 receiver and model 400 transmitter. I believe these were sold as part of a ham radio training course by National Radio Institute, Washington, DC. Both tube-type, of course, and pretty simple. I'm hoping to get the manuals to loan out also. If you have copies of one or both manuals, or just a schematic, please send me an email message so we can work out a way for me to obtain a copy. Thanks!

A friend of mine (Doug - VE3BGK) has a strange problem with his TS440.
Seems that sometimes, when the frequency is between 14Mhz and 22Mhz, the
display blanks out showing only a string of dots. The receiver goes dead
when this happens. If he retunes back below the cutout frequency the
display comes back but the receiver still acts dead. Doesn't seem to matter
whether it's warm or cold. Sounds like the PLL is flakey to me.
He's tried reseating connectors, resetting the CPU, etc.

Anyone seen this before?

3710. Re: Trend towards requiring SASEs for domestic QSLs?

Newsgroup: rec.ham-radio
Date: 1989-11-01 21:20:02 UTC
From: holly@hpcupt1.HP.COM
Message-ID: <7120091@hpcupt1.HP.COM>
Source record: 15885

I have had some hams sent my SASE envelope back, in their envelope
saying that I dont need to do that. Some others have used my
envelope, but put a stamp inside with the comment that I should
not have to send a SASE. Many just use the SASE and send the card.
This is fine, I wanted the card that is why I sent mine and my SASE.
I can understand a ham not sending a card for every contact, I dont
either. But if I want the card, or heavens forbid someone wants a
CA, it is curteous to return the card. But the thing that really
makes me mad is the ham that takes my SASE, card and all and throws
it all away. Hey, I would be happy to get the confirmation in the
form of a short letter, the back of a post card, or even a 3X5
index card. I suppose you could use a condom wrapper, but I might not
put that on the wall... hi hi. I had one ham (W6IMM I think) that
I worked in a contest and wanted his card on 80M rtty. He said he
did not send a card for 20 years, but got a airline postcard (he is a pilot)
and put the info on the back. A differnt card, I like that. He QSl'd.
One other thing that is curious, I have had a nice QSO with various
hams and I causually mention I could use a card from their state and
ask if they are good in the callbook. Suddenly the band is solid QRM
and after several repeats they still can't copy the last transmission.
Funny, that there is no QRM at my end, must be a local at their end I
cant hear. I have noticed that return rate is about 60% for no SASE
and around 90% for a SASE. I think alot of the hams dont QSL because
why bother, they have the wallpaper, doesnt everybody? Personally I
think it is a sad state of affairs when a ham can spend thousands of
dollars on equipment, towers, antennas and the like and cant spend
a $100 a year on cards an postage. Well that is my 2 cents worth

>If simplex autopatches were illegal on 2 meters then access to ANY 2 meter
>repeater's patch would be illegal for the same reason of remote control.

Yup, that's the truth, unless you are controlling the repeater by another legal means. In particular, there must be ANOTHER control op (or the same control op with simultaneous access to separate legal means of control).

The legal means of control can be either a control link on another band, at or above 220 MHz, or it can be a phone line, obviously separate from the line that the patch is on. Note that "Automatic Control" of a repeater is not good enough. When the repeater is doing a phone patch it isn't in repeater service, it's in auxiliary service. And there is no such thing as "Automatic Control" for auxiliary service.

Very few clubs actually do this, of course. It costs money to have two phone lines, for example. But that's what it takes to really be legal. The club I was most recently active in does it legally. A call to the control phone can be used to dump the current patch on the patch phone.

3713. a program for the callsign project

Newsgroup: rec.ham-radio
Date: 1989-11-01 23:20:18 UTC
From: rusty@cadnetix.COM
Message-ID: <10148@cadnetix.COM>
Source record: 15888

Well, just for kicks I wrote a (pretty awful, structurally speaking) C++ program to take the 46 meg file from the 'callsign project' and do a binary search of it for a callsign.

Whats so great about that? Well, first its my first C++ program.

Second, the callsigns are no longer in the split strange-o format but rather back into N7IKQ (rather than '7IKQ N' format) form, but they are sorted as though they were stored in the split format.

Thirdly, (?) the records are all variable-length.

Here is the output from it after running it to find 2 'random' :-) callsigns:

Command (fc,fl,ff,ffl,f,q,?) ? fc

Please enter callsign to search for WV0P
Searching for WV0P

WV0P E Colin R Wright
1031 Turner Blvd 4
Omaha, NE 68105

Command (fc,fl,ff,ffl,f,q,?) ? fc

Please enter callsign to search for N7IKQ
Searching for N7IKQ

K7IKR A Francis Longo
1014 Grapevine Rd
Santa Maria, CA 93454

Command (fc,fl,ff,ffl,f,q,?) ? q

Oh, dear, I found a bug! Well, back to the drawing board.

In any case, its really rather quick at finding things, and I'd be willing to post it to a sources group somewhere, but how many people have a c++ compiler? (I can also run the C++ preprocessor on it and post that, as well, which is valid 'c' code and should be able to be sent off to a 'normal' c compiler).

(I won't post it until its fixed, though! :-).

Then he has not been on any flight I have ever been on because he would
get a big hassle from me real quick.

Of course there is the problems he will be causing by accessing many
multitudes of cells concurrently, but I don't care about that.

What I do care about is an aircraft being mislead into the wrong airspace,
not being able to see another airborne object, etc., and possibly being one
of the very low statistics of airplane accidents.

I suppose I might be willing to pay in the order of low hundreds for a CHOSEN call sign. However it would have to be very little payment to actually search for its availability.

Call signs should be restricted to match license class OR LOWER (i.e. if an Extra decides he wants his old Novice call back, he would be allowed to have it unless it has be reassigned).

Also, the same system could open up the 1x1 calls (yes, they really are allocated to Amateur Radio in Part 2 of the FCC rules) for things like special event stations.

>but don't have to take the test again.
>

Yeah, Phil, I agree...

In reference to renewals and grace periods:

License Terms (copied from p. 4-6 of the 8th edition)

"Licenses are normally good for ten years. If you have a license good
for the old five-year term, a grace period of five years is allowed should
you forget to renew. After two years of the grace period has passed, you
will lose your call sign and will be assigned a new one.
"If you have a new 10-year-term license, issued since January 1984, the
grace period for reinstatement is two years.
"If you apply for reinstatement of your license under the grace period,
you may not operate your station until your reinstated ticket arrives."

Thus spake the ARRL "FCC Rule Book" staff...

KB3YV claims that phone patches which evade toll charges may be illegal
because of "restraint of trade".

One of the interesting developments in telecommunications in the past
few years has been the emergence of "bypass networks". One way that
this can work is.....suppose your company has several locations around
a large metropolitan area that are long distance from each other. If
telephone traffic ever gets large enough to give you the economic incetive,
you may choose to route your phone traffic between your offices over
some private network (microwave, T-carrier, leased lines, etc) rather
than paying toll charges to the phone company.

This is NOT illegal!

Likewise, I think it's funny when hams cite some non-existant law to
prevent ham autopatches from "byapssing" the local toll network.
The club I belong to still prevents this, due to some vague fear that
the local phone company wouldn't like it. My response is, if US West
ever did anything retalitory because of this, the state utility
commission should hear about it. If Boeing Company can bypass and
connect to the local telephone network, why can't hams?

The first commercial transistor was, without a doubt (IMHO)
made by Regency. It's sensitivity was such that it could
pick up the more powerful local stations most of the time.
It used a 22.5 volt battery. Hit the market ca. 1957, and cost
about $55.

To the best of my memory,

There has been some discussion in the last few years regarding health hazards of Amateur Radio. In these discussions, the topic of mental health has been, in our opinion, sadly overlooked. This is about to change.

This coming Friday, November 3, at 7:30 (or so) EST, we will once again be putting our commemerative station on the air. Celebrating the 82nd anniversary of the Cremation Of Sam McGee will be radio station W8VR, crewed by the old team of W8VR, WB8FPQ, N8BKF, KT8Y and KE8YY.

Work us, send a QSL card and receive a handsome, two-tone 8-1/2"x11" certificate suitable for framing, signed by the participants and imprinted with genuine ash from the cremation of Sam McGee. Would we lie to you?

Where will you find us? On all Real Ham Bands: 160, 80, 40, 20 & 10. Most likely on the low end of 80 (clear of the DX window) and on 20, clear of the contesters.

Hopefully this season's special events station will be as successful as the last four, except this time we'll try to remember that you use LSB on 80.

-qrz? de ke8yy

>wonder if it is possible to get my original callsign back.

>My original call was WB4QVO. About three years ago, I happened across my ham

I posted the reply to let others know about a service that is available.
I looked you up in the 1989 Callbook and your old call is not listed. This
is usually a good sign.

The Radio Amateur Callbook company offers a FREE service of callsign lookup
You call a bbs in the Chicago area (312) and it prompts you for a callsign
Don't get all excited just yet, if it finds the callsign in its database
it tells you that this callsign is a published callsign and it does not
give you any more information. Here is the info:

Telephone (312) 234-8011 300/1200 baud 8 data-bits 1 stop, no parity.

there is a description that differs from mine in the 1989 callbook on page
33A.

>Hmmm, it was my understanding that the FCC kept the same call sign on a
>renewal even though it was late within the grace period.

The last time I noticed this rule, just BEFORE the recent
re-organization of the rules, the situation was:
You have a five year grace period to get your ticket back, but
only a one (or was it two) year period to keep the old call.

Sorry to be vague. I was hoping someone would quote it from the
new rulebook, but nobody has.

And on re-using calls and picking your own call: All these rules
and procedures have changed many times over the years. I got my
current "initials" call in 1976 when it was briefly possible to
pick your own if you were licensed long enough as an Extra. I
was first licensed in 1957 as WN2TOX, then W2TOX, and I was at
least the third holder of W2TOX. I was probably the second
(maybe third) holder of W9FUB and the first holder of K1YKB and
WR1AKJ. I held A2TOX as a MARS call, before A2 became Botswana.

Message-ID: <8911030811.AA09554@ucbvax.Berkeley.EDU>
Source record: 15907

Since there have been some postings recently seeking sources for antique or even just slightly-old electronic parts and equipment, I thought it would be worthwhile to post a pointer to a major info resource in this area -- a monthly small-format publication that carries ads from individuals and companies involved in this field:

Antique Radio Classified
PO Box 802
Carlisle, MA 01741

They will send a free sample upon request. If you circle the number for their ad in CQ or PopComm, all they send is a postcard with the rates and a note to send it back for the free sample. Since that will cost 25 cents to put it in an envelope, you are better off forgetting the bingo-card number and sending a 15 cent postcard directly.

Subscription rates are $11 for a 6-month trial (mailed 2nd class, US only); $20 for 12 months 2nd class; $30 for 12 months 1st class mail (US & Mexico). Canadian rates are $14, $27, and $32 (air mail) respectively, in US funds.

I am not really too deeply involved in this, so I don't have a subscription. I have gotten a free sample in the past, and it looks like a well-put-together publication. It has better production quality than many other such special-interest limited-circulation periodicals I've seen over the years.

Not only would this be a source of vendors for equipment and parts, and a way to buy and sell older electronics between individuals, but it also will provide pointers to local or regional clubs, associations, and swap meets devoted to this field.

Regards, Will

I always use an SASE when I want a card back. My success rate with US stations is pretty high, but not 100% (I'm still waiting for a Utah card on 20 for my 5BWAS, and KH6 on 80, for example). I just got a return card in the mail yesterday, with my SASE returned to me. I was pleasantly surprised, to say the least.

We (Arizona Repeater Association) do this. Recently we were shopping
for a patch controller (I get tired of having to fix the one that I
built for ARA). ACC said they had NEVER had anyone ask for control on
other than the input frequency! Their RC-85 only has one DTMF controller
(although it may be switched to a control receiver on commant). This means
that there are a heck of a lot of illegal patches out there!

OR a new tech version of an old tech toy. I remember seeing an aritcle
in a late 1950's edition of "T.V. and Radio" (or some similarily titled
magazine) of a similar toy.
The transmitter was a simple one or two transistor RF oscillator. The
recievier was any portable AM radio (they are directional ya' know).
Didn't beep and probalby wouldn't look as nice as today's "store bought"
version but certainly cheap to build and prehaps even interesting enough
for the kids to "help" with.

> the other guy since he has no way to know) or do they have to be DUPped?

That's an easy one. BOTH sets of contacts DO count, because they were
worked by both stations. It's basically the same as if you have a
rig on 15 and one on 20 at the same time, and both "rigs" (of the one
group) work both rigs (on 15 & 20) of another FD group. Think of the
Novice station as another rig. The only difference is that the stations
worked by that transmitter are logged separately (BTW- so are those
worked by the Satellite station, if you have one set up), but are
totalled into the FD group's aggregate score.

Hope that hasn't confuzed the issue even further.

Message-ID: <89110303370014@masnet.uucp>
Source record: 15913

Is not the reason why there are so many standards of measurement the arbitrariness of them all? Nearly all units in any system are based on quite arbitrarily chosen quantities inherited from the dawn of the technology. Then some of the so-called fundamental units are themselves derived units, e.g. why meter - KILOgram -second? Would not meter -gram -second have been more logical?
Actually better than any of these would be a system of measurements based on fundamental physical constants. Give things like Planck's Constant, the velocity of light in vacuo, and the electronic charge the value of 1 and derive units of mass, length, time and electromagnetic units from them. Five constants should be sufficient (h, c, e, G(universal gravitational constant) and k (Boltzmann's Constant)).
In the meantime who cares what units anybody uses as long as they know what is meant?

One of the best (may be THE best) contest logging/ duping programs
is sold by JCA Associates. They don't offer one program for everything,
but rather have adopted a basic format, and fine-tuned it for
optimal use on either the HF contests, or the VHF/UHF ones. The programs
are written (I think) in Turbo Pascal, and function on XT/AT's and
Clones. I have used the VHF/UHF version since January, 1989 and
WON'T go back to paper and pencil! Every QSO is written to the disk,
so crashes or power glitches are no problem, it obviously runs in
real time, uses the system clock, and prints a LOG, DUPE and SUMMARY
SHEET which is in ARRL format. The VHF version also includes a
scheduler to allow you to make skeds before the test, enter them, and
be prompted by the computer as it comes time to go to that freq for the
sked. You can also do a partial call search to see if the call has been
worked before on the current band (a dupe) or on any bands (for new
band multipliers).

The HF version has been around a little longer, and was reviewed about
a year ago in the National Contest Journal. They gave it a RAVE review!

BTW, after you're done with the contest ,and you see that you logged
a call wrong, there is a very good editor included to allow you to fix
any problems like this.

You can write for more info to:

JCA Associates
P.O. Box 10404
Rochester, NY 14610

Hope this helps.

}
}Then he has not been on any flight I have ever been on because he would
}get a big hassle from me real quick.

Me too, and I fly VERY frequently too.

}Of course there is the problems he will be causing by accessing many
}multitudes of cells concurrently, but I don't care about that.

Agreed.

}What I do care about is an aircraft being mislead into the wrong airspace,
}not being able to see another airborne object, etc., and possibly being one
}of the very low statistics of airplane accidents.

Remember that celular phones are quite close in frequency to the radar transponders that tell ATC all kinds of nice things about the aircraft. Then think of the RFI problems, like extending the landing gear in flight. The controls are all electrical on most airliners, better shielded than your neighbor's Stereo but still subject to the same RFI!

At best a dumb stunt IMHO.

Has it ever been verified that radios and hand held scanners, etc have
been responsible for some sort of electronic problems aboard an aircraft?
If this is true then how do they get safely over radio and TV towers that are
putting out many thousands of watts? An aircraft flies over these all the
time at only a few miles distance from them. And radios and scanners and
their local oscilators put out only a micro watt or two. Cellular phones
and other transmitting devices of course put out much more. But if these
can cause problems then again the more powerful transmitting cells on the
ground surely would be a problem too, wouldn't they?
I once took a computer chess set on a long flight. Could the system clock
have wreaked havoc upon this huge jet aircraft's electronics.
Also, some people fly radio control aircraft near the local airport here.
These transmitters have enough power for line of sight control and real planes
come quite close on their approach and takeoffs. Yet, I've never heard of a
problem. What really is the story here??? Inquiring minds want to know.

Message-ID: <8911022135.AA27897@cmr.ncsl.nist.gov>
Source record: 15919

I usually send SASEs with my 6-meter cards, QSL managers generally require them, and it seems to HELP on getting other responses. Many unsolicited cards come with SASEs, but certainly not all.

Back in '83 I operated on 6-meters from FG7 for a couple of weeks. As far as I can tell, there had been no 6-meter activity from Guadeloupe for the preceeding 10 years, and there hasn't been any since my operation. I was a new country for even Ed Tilton (W1HDQ) and Bob Billings (VE1YX-he now has 95 countries on 6). I expected to be swamped with cards from all 180 stations contacted (the VUCC grid system had started).
I got unsolicited cards from about 60-70% of the stations contacted; some had to QSL me twice since I think the neighbor's dog ate some before I got back home! After a year or so I sent QSLs to all the rest, and asked for cards in return. VERY few replied.

Just another data point.

The only experience I've had with an HT in airports was the last time
I was in Toronto. I purchased a used FT-208R while on the trip,
and decided to carry it on the plan rather than pack it in one of
my bags. While clearing security at the Pierson Int'l Airport, they
ran my "cellular phone" through with no questions asked. What upset
them was the keychain I was carrying. The one with the five little
buttons you can push to get various starwars sounds effects? The one
that didn't work 'cause I pulled the batteries so it wouldn't go off
while I went through security? Anyway, the radio passed, but I spent
15 minutes disassembling my keychain before they would let me through.

(In the process of doing this, in was mangled beyond repair. Once he
said "OK, you can go" my first stop was at the nearest garbage can
to dump the now useless keychain. I *hate* Toronto :-)

> I remembered a fellow ham showing me (several years ago) an old CB
>that he had converted to work 10m FM ...

I don't know about FM, but converting a RS TRC-452 to 10m AM
was easy enough. I've never completed the work to enable CW on it.
I need to add a BFO; it transmits CW just fine.

The digital PLL synthesizer (in the 452 anyway) is fed BCD from
the 40 position switch. I fiddled with that some (it has like 8 or 10
MHz coverage!, tho only about 1 MHz at a time; ya have to tune it near
the range you want). The PLL gives you 15360 KHz + the BCD number on
the input * 10 KHz as output. Note that 15360 is a multiple of 512
(which is a power of 2; binary comes into play).

I also "flipped the image" on the receiver's front end.
(this is fuzzy for me ... it's been at least five years) It does dual-
conversion, with a 10240 KHz (another multiple of 512) stage and a 455
KHz stage. 455 KHz times 2 is 910 KHz. The base of my new coverage is
910 KHz above CB, plus 300 KHz, which I got by tweaking the digital
input to the PLL. I also get a little wider range (CH1 to CH40)
than the CB did from the same BCD fiddling.

Boy, that's interesting ... I didn't even think of that. (I am the guy
who brought it into the twisted-pair world).

Well, lying or making that letter up would be "false or deceptive
signals" which is illegal, so I kinda suspect that N4WBO did NOT make it
up. He said that he got it off of compuserve; perhaps somebody could get
on to compuserve and get a source, and maybe we of the net can verify it?

Someone asked if interferance had been verified. Yes I have tested for it and seen it. The problems I saw came from inside the airframe. The airframe is a good shield from outside. However, inside is another story. There are many miles of wire in an aircraft. They are effective antennas at most frequencies. For some reason(not logical), much of the avionics electronics was not designed to filter out noise on the lines. Even the radiated signals from a computer can be detected on the aircraft signal lines, and the 28v power lines. Most of the time the levels are too low to be of concern, but sometimes they are not. I no longer have the tech data available, but the levels that are considered acceptable by the AF are hard to achieve with computers. One box I built met those specs, but was still observable in the cockpit. The pilots let it go since it was "insignificant".

There are new tariff's for the phone line connections to the locals that introduce new charges for those trying to bypass to get into some other phone exchange. Talking to someone somewhere else w/o the phone company being involved at all is ok. But if you enter into the local phone lines at a distant location, the tariff's are calling you a long distance carrier and charging as such. It's not illegal, but you do have to pay more to get the local connection.

47 CFR 97.205 (e) states: Ancillary functions of a repeater that are available to users on the input channel are not considered remotely controlled functions of the station. Limiting the use of a repeater to only certain user stations is permissible.

Therefore we do not have to involve an auxiliary station when it is a repeater station that is doing the autopatch.

> The legal means of control can be either a control link on
> another band, at or above 220 MHz, or it can be a phone line,
> obviously separate from the line that the patch is on. Note that
> "Automatic Control" of a repeater is not good enough. When the

> it's in auxiliary service. And there is no such thing as
> "Automatic Control" for auxiliary service.

Since the rules have been reorganized, and minor changes made, the FCC has effectively now made such autopatches legal when they are part of a repeater.

A few years ago I was on a flight from NY to Las Vegas.
During the flight, I was trying to find a World Series score
on the radio. I , at the time, knew nothing about interference.
It could have been my imagination, I think it wasn't, but when the radio
went on, I felt the engine decellerate.

I turned the radio on & off two times. This happened each time.

I then tucked the radio away for the rest of the flight.
I was using the AM radio. I wonder if the FM would interfere as well.

What does cause the interference, if you arent transmitting anything?

3754. Tuning dipoles and antennas.

Newsgroup: rec.ham-radio
Date: 1989-11-03 14:35:15 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <03.Nov.89.14
Source record: 15779

Tuning/resonating dipoles - well i never try resonating for lowest SWR.
Remember, a low SWR doesnt mean anything as far as radiation efficiency
or resonance are concerned (if you like, put a dummy load on the end of the
coax - nice low SWR but it wont radiate very well :-)

The thing to do is trim for RESONANCE - you measure this with your trusty
dip oscillator. Get the dipole resonant at the frequency you want, then
squirt some real RF up it. Dont worry about SWR. You'll put out a far better
signal with a resonant antenna and 2:1 SWR than you will with a non-resonant
antenna and a 1:1 SWR, all other things being equal.
After all, the power 'reflected' by a non-perfect antenna match should be
're-reflected' back to the antenna by the PA tank circuit.
If you have a solid-state PA or linear, then buy yourself an antenna matcher
to keep it happy.

Also, remember that the workable bandwidth of a dipole is related to the
ratio of length to cross-section. Trying to get a good match across the
whole of 3.5 to 4 MHz with a 'thin wire' dipole is just not possible.

Making each 'half' out of several wires spaced a few inches apart will help
here.

From: rochester!ray@pt.cs.cmu.edu (Ray Frank)

Has it ever been verified that radios and hand held scanners, etc have
been responsible for some sort of electronic problems aboard an aircraft?

The current rule was instituted after a fatal crash was attributed to the
local-oscillator emissions of a passenger's FM radio.

If this is true then how do they get safely over radio and TV towers that are
putting out many thousands of watts? An aircraft flies over these all the
time at only a few miles distance from them. And radios and scanners and
their local oscilators put out only a micro watt or two.

The inverse square law. The amount of power present a few miles from a TV tower
is down to the microwatt level.

I once took a computer chess set on a long flight. Could the system clock
have wreaked havoc upon this huge jet aircraft's electronics.

<Enter Victor Cifuentes mode>
Quite possibly. Have you measured the emissions from your chess game
lately? Are you prepared to certify to the other 200 passengers (and
their dependents) that your game cannot possibly interfere with the
plane's navigation equipment?
<Exit Victor Cifuentes mode>

This subject gets hashed over about twice a year on this
list, and twice a year on the AVIATION mailing list as well.
The upshot is that the prohibition makes sense, and (to forestall the other
standard part of the argument) the pilot of an airline flight does NOT have
the power to grant exceptions: that must come from the airline itself.

3756. Kenwood TS520 - Is it a good deal?

Source record: 15782

I have recently purchased a second-hand Butternut HF6V vertical antenna. The antenna is complete except for a section of 75-ohm matching line that was buried in the ground at the original installation. My understanding is that the missing secton is a quarter-wave transformer that is intended to match a 100-ohm antenna feedpoint impedance to 50-ohm feedline. As the antenna is an "all band" antenna, I don't know at what frequency the quarter-wave transformer is intended to operate. Can anyone on the net provide me with the length of the matching section? Please e-mail direct, and thanks.

My two top recommendations for receivers are:

1. The Sony ICF-2010.
This set lists for ~$450.00, and retails for ~$350.00.

2. The Sangean ATS-803A.
I don't know list price; it retails for ~$190.00.

Of course, if you've got $1200.00 to burn, pick up a Japan Radio
NRD-525 ... and while your at it, pick one up for me! ;-).

Back on the serious side, permit me to recommend

Universal Shortwave Radio, In.c
1280 Aida Drive
Reynoldsburg, Ohio 43068
U.S.A.
(phone: 800-431-3939 and 614-866-4267)

as a great place to buy books and equipment for the SWL/DX hobbyist.
If you send them $1.00, they'll send you a copy of their catalog of
receivers, antennas, antenna tuners, preselectors, books, etc., etc.
They are both very freindly and knowledgeable.

I've also had pleasant dealings with

Gilfer Shortwave
52 Park Avenue
Park Ridge, New Jersey 07656
U.S.A.
(phone 1-800-GILFER-1 and 201-391-7887)

Have fun!

3760. QSLs and SASEs

Newsgroup: rec.ham-radio
Date: 1989-11-03 17:41:41 UTC
From: oo7@ut-emx.UUCP
Message-ID: <20428@ut-emx.UUCP>
Source record: 15785

tad@ssc.UUCP (Tad Cook KT7H) says:

I know several active hams who do not QSL. One is K7SS. (The exception is his recent Guemes Island operation). When he is working them at the rate of 180 per hour in a contest, his rate and score would go down considerably if he had to explain to each one that he does not like to QSL.

When I decided to be patriotic and get a WAS, I reckon I got a 95% return rate on cards by sending them with an SASE and enclosing a note mentioning that I was asking for the card for the WAS. It would never have occurred to me not to send an SASE. But K7SS (mentioned above) was one of the many who did reply - in fact, he sent me cards for two of the 50 states, as he operated two contests from different places. So he is a Good Guy in my books!

However, what bugs me is *not* having to send SASEs, but the people who do not reply when you do send them an SASE. Not to get libellous here, but I need MD on 160, and W3LPL wouldn't reply to a card. KQ2M never replied to 3 requests for cards for his HD5X operation, and I still need that on 80m. I realize these are Big Contesting Types, but the least they could do is make up a simple note saying "sorry, I do not reply to QSLs", stick it in the SASE and send it back. Surely they have to open their mail to find out whether it contains a QSL card? What do these guys do with the SASEs? I have visions of them sitting in the near-dark (too mean to turn the light fully on), gleefully peeling the stamps off the SASEs, chuckling as they throw the QSL card on the meagre fire, then pulling out their sack full of unused 25c stamps and counting them again. Perhaps instead they sell the SASEs for 24.9c each to the neighbors.

I think the policy is pretty straightforward. If you really want the guy's card, send him an SASE. If you don't care much whether or not you get a card back, send it postcard rate for 15c and then don't complain if you don't get one back. But if you get my card and an SASE and ignore it, you are a Mean Guy. My only revenge on such people is not to work them when I hear them in later contests - I suppose I secretly hope that one of them will be pushed into 11th place by one point (the one I didn't give them in the contest), and not get listed in the little QST Top Ten box. Hee hee, drool drool....

Source record: 15788
Cross-posted to: rec.ham-radio,sci.electronics

random bright xmas lights

Here's a simple circuit to create a nice effect with those small xmas
light strings on the tree. Get an even number of light strings, some
with blinkers. Getting pairs of sets would be good, but not critical.
Get a pair of 120V outlet sockets, and wire them in series. Plug in
half of the strings into one of the sockets, and the other half into
the other socket. Connect the series wired outlets to the powerline.
Any one string of lights will have about 60V across it. When some of
the blinkers start working, some of the lights will vary in brightness,
some brighter, some dimmer, and of course some go out! The
time-brightness pattern will be random. Of course, the lights will
always be dimmer than when you plug them in directly to 120V, but
they're still plenty bright enough. And they will last much longer.
It works best with 8 or so strings. You may want to swap around
strings to fine tune average brightness levels.

Yes, I've noticed this behavior as well. Once I was on a 747 from
Boston Logan to Dulles. I was playing with my UHF HT and noticed that
every time I depressed the PTT button, the plane executed a perfect
snap roll! I tried this several times, but eventually my battery went
dead. I went back to the restrooms to plug my charger into the
shaver outlet, but for some reason, all the restrooms were occupied.

Since the "classic curly wire" seems to be the thing to catch the eye of the security folks, perhaps this is how I will be able to test just how well they can see through those lead lined film shields. One would be stupid to put something that even looked like a gun in there just to test them, but putting a coil corded microphone in there along with a few rolls of film might be the real test. If they consistently let it pass, and catch the coiled cord outside of the bag, then I will assume it is not the case that they can see inside the bag. I'd hope they'd recognize that the bag is blocking their view and ask to open it for a visual inspection (to make sure I'm not trying to slip in a gun by that method).

Yes, the first time was a crash in the late 1930's when the LO of an FM reciever interferred with the navigation receivers ad a plane flew into a mountain. FM 88-108Mhz, LO=RCVD. Freq. + 10.7 or 98.7-118.8 Mhz The aviation navvigation band is roughly 108-118 Mhz (118-135 or so are used for voice). Even microwatts at close range (i.e. inside a metal shell) can cause interferance.

I grant its not too likely, but the consequenses are so severe that it just isn't worth the risk.

Check Aviation Week for other examples.

}If this is true then how do they get safely over radio and TV towers that are
}putting out many thousands of watts? An aircraft flies over these all the
}time at only a few miles distance from them.

The difference between shouting in your ear and shouting at you from a few miles away. Its call "square law attenuation" and means that the signal drops off VERY fast as you move away.

And radios and scanners and
}their local oscilators put out only a micro watt or two.

More like a few milli watts, but see above that is far more than enough. Try tuning two TV sets to channels 40Mhz apart in the VHF band and you will see what I mean. The QRM can be seen for 50-100 feet under the right circumstances.

Cellular phones
}and other transmitting devices of course put out much more. But if these
}can cause problems then again the more powerful transmitting cells on the
}ground surely would be a problem too, wouldn't they?

No, for one thin the transmitter frequency is particularly bad for cellular phones and transmitters ALWAYS raise the possibility of RFI. Take a VHF/UHF handi held into an appliance/TV store one day and hold it close to some of

the stuff while its operating. Usually 6-8 inches is enough to screw things up with my 5W HT220 on 440Mhz, but I have seen microwave ovens and fancy stereo equipment go crazy from as far as 20 feet away.

There used to be a model of Mercades which would stall if you turned on a transmitter within 20-30 feet of it. It screwed up the electronic ignition. Check QST back 10-15 years or so, there were quite a few articles about it then.

}I once took a computer chess set on a long flight. Could the system clock }have wreaked havoc upon this huge jet aircraft's electronics.

Unlikely since the FCC has imposed very strict radiation limits on computer equipment for some years. Most portable computer equipment carries a label certifying it as safe for use on and aircraft too.

Once again the frequency is important, a computer clock oscillator is typically 2-4X the "clock" frequency of the CPU so its typically 16-30Mhz which is a long way from 110Mhz!

}Also, some people fly radio control aircraft near the local airport here. }These transmitters have enough power for line of sight control and real planes }come quite close on their approach and takeoffs. Yet, I've never heard of a }problem. What really is the story here??? Inquiring minds want to know.

In this case there are three things acting to help, distance, low power transmitters (.25 W typically) AND frequency - either 50Mhz Ham band or 72/75 Mhz unlicenced band.

In addition any interferance from a stationary transmitter is soon "left behind" as the aircraft flys on. The worst effect would be a temporary "glitch" which is obviously erroneous, a transmitter on board the plane can easily produce a continuous error which is almost impossible to spot.

The bottom line is that radio equipment on a commercial flight simply is a risky thing to do, even if the pilot knows about your transmitter/receiver there may well be another he DOESN'T know about. The consequences just to play games are just stupid.

By the way, private or non-commercial flights often do carry ham gear and all kinds of stuff, but there is rarely 300 people on board and the pilot usually is in very close communication with the people using the gear. A VERY different set of circumstances!

NEW CONVERSIONS

from EE Times -- 17 Aug 81

Earl rogers, president of Precision Monolithics, has uncovered the
following useful conversion factors.

10^12 microphones = 1 megaphone
10^12 pins = 1 terrapin
10^-12 picolos = 1 pico-boulevard
10^21 picolos = 1 gigolo
10 rations = 1 decoration
10 millipedes = 1 centipede
1 centipede/second = 1 velocipede
3 1/3 tridents = 1 decadent
5 holocausts = 1 Pentecost
10^6 bicycles = 2 megacycles
10^9 micrometers = 1 kilometer = 200 pentameters
10 monologues = 5 dialogues = 1 decalogue
2 x 10^3 millinaries = 4 seminaries (*) = 1 binary
10^-5 dollars = 1 Millicent
1 milli-Helen = the amount of beauty required to
launch 1 ship
nano-nano = a prefix designating 10^18

(*) The enlightenment generated by a seminary is measured in luminaries.

> I occasionally work DX on the HF bands, and would like to

Here is basically how it works....consult the QST (look in the mini directory in most issues) which has info on incoming bureaus, or the operating manual.

You send a 5 x 7.5 inch envelope SASE (with extra postage if you expect several cards) to the bureau address listed for your call area. That address usually is a club, or member of the club, who does the bureau function. Your sase goes to some volunteer, who handles the cards for your call. In the 9 land, area, the person is determined by the first letter after your number. For me (KU9C), the guy handles all '9C' calls. They fill you envelope with cards, and then mail it back to you. Some bureaus mail every month or so, whether you have 1 card or 1000 (they don't send empty envelopes, however...you gotta have 1), others wait until you have a few in the envelope.

Another way, which some of the bureaus do, is sell 'postage credits'. oYOu send them about the cost of 12 envelopes plus stamps (i think $5-$6 in 9-land), and they make up 12 envelopes for you, and supply them to your particular manager. This is noted in the QST/OP manual reference above, as to whether your bureau does this service. While there is a mark up for this service, I find it less of a hassle.

I suggest you find out who handles your cards by writing the buro. THat way you can communicate directly with the person handling your cards,. This helps if you mail your own envelopes, as it cuts down some of the delay in getting the envelope to the manager.

Some historic moments are forever lost.

We all know that the first transatlantic message sent by Marconi was the letter "s".

The first words spoken on the telephone were "Watson come here I need you"..

BUT somehow, the first words ever spoken over a radiotelephone transmitter have been lost forever.

We will NEVER know what those first historic words were.

BUT, we can be fairly certain of what the transmission IMMEDIATELY following it was:

"The Frequency is in Use Old Man....."

My most common use of my 2m HT is for air-air or air-ground communication when hang gliding. The clarity and ease of use of FM HT's makes life absolutely wonderful for us pilots and the chase crews. The problem is that other 2m operators may not hear us but, due to our altitude advantage, we can hear them (especially in the Los Angeles county area). It's hard for us to retune in the air so when possible, we request the interfering party to retune. My question is: FM sub-bands might best suit our needs?

> it will only be used for a finite number of stations....

I have a Magnavox (Philips) D2935 portable receiver, which covers
0.146 - 30 MHz AM/CW/SSB, as well as FM broadcast. It has
LCD digital readout, a tuning knob as well as keypad frequency
entry, 9 memories, and can run on batteries.

It also features a built in AC supply, which makes this radio larger
than other SW portables. I run mine on 117VAC 60Hz, but
the owner's manual shows that the radio has a switch to select
various AC voltages. I don't know if 220V 50Hz is one of them.

The D2935 is a good buy, but I read it is being discontinued.
I got mine at Sears, althouth I see that EEB sells them for
about $190:

EEB, 137 Curch St. NW, Vienna, VA 22180

+---------------------------------------------------------------------------+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
Login: bbs
Number: (301)-335-0858 -- 1200 & 2400 (Non-MNP)
Number: (301)-335-1955 -- 2400 (MNP), 9600 & 19200 (PEP) [V.32 soon]
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700
Meg of on-line storage. Most transfer protocols are available!!
MNP up to Level-5 is supported.

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.05)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition
```

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

> about $55.

Right about most of it. The Regency TR1 was intro'd in 1954.
In terms of sensitivity, picking up powerful stations was just about the
ONLY thing it could do. Transistors were pretty unreliable quality, and
the only way you could make a decent set was to use 7 or 8 of them.
Regency used only 4, so the result was poor sensitivity, and low audio
level.

Pretty awful receiver, but it's worth a bit, since it was the first.

BTW, anyone have one they want to sell? Am looking for one!!

NOTE: The EEB had serious problems getting my order of a Magnavox D2935 to me, so I called Universal Shortwave Radio, and had them send me one. I cancelled the order with EEB with no problems.

The serious problem was that for three weeks, they were out of stock and new units were expected "tomorrow", or "at the end of the week". I got tired of calling to see when they were shipping my order.

Also, the Universal Shortwave price was lower. I am very satisfied with the radio. It is excellent, and has little trouble picking up faint stations, even using the Davidson Dorm Resonant Gutter Antenna (TM)!

Also for $ 499.00 you can have the Grundig Satellit 500. If you can spend more, get the Satellink 650. If they still make it get the satellit 3400. Grundig makes the Rolls Royce of shortwave radios but is not very wide-spread in the US.

I used to have a TS-520SE for many years. I used it for AMTOR ARQ-mode for about a year and a half with no problems. I even worked some locals which would be worse-case turnaround delay. If you can get used to the clanking relay you've got it made. :-)

3785. Re: Shortwave Radio

Newsgroup: rec.ham-radio
Date: 1989-11-05 00:03:21 UTC
From: muller@sdcc10.ucsd.edu
Message-ID: <4899@sdcc6.ucsd.edu>
Source record: 15806

Here are four references where test reports on shortware radios can
be found.

Passport to World Band Radio
International Broadcasting Services
Box 300
Penn's Park, PA 18943 USA

World Radio TV Handbook
Billboard Publications
1515 Broadway New York NY 10036 USA

Radio Receiver - Chance or Choice
Gilfer Shortwave
52 Park Avenue
Park Ridge NJ 07656 USA

MORE Radio Receiver - Chance or Choice
Gilfer Shortwave
52 Park Avenue
Park Ridge NJ 07656 USA

Passport and World Radio come out yearly. International Broadcasting
Services sells "white paper" test reports on many radios. Passport
is good for beginners also. Id check out the reports before buying
as there are a lot of very poor radios around (by MAJOR radio companies
besides the fly-by-night companies). Just because a company make one good
radio, doesn't mean all of their other models are good.

I remembered this discussion from before, so last time that I was on a commercial flight, I brought home a copy of the "Inflight Entertainment & Information Guide." Here is what United Airlines thinks about electronic equipment:

Televisions, AM/FM radios, portable cellular telephones, remote control toys, and similar electronic devices must not be used on board because they may interfere with communications and navigations [sic] systems.

No mention of computers, and I sure do see a lot of laptops in use on flights.

You can use it for ARQ with no problems. I use one regularly for
AMTOR work. The QSK is sufficiently fast enough that I did not have
to add any delay to the handshake turnaround time.

I typically run it at about 50 watts out and the finals seem to be up
to the task.

> be enough but 4 to 8 would be better.

I was just turning the data sheet box yesterday (data sheets are like
compost piles: they need to be turned occasionally) and some blurbs on
crystals and filters were left near the surface:

hi-q crystals [sic] Olathe, Kansas 913-764-4544 (monolithic crystal filters
from 10.7 to 90 MHz, with quite a few at 45 MHz)

Time & Frequency Ltd. Mitchel Field, NY 516-794-4500 ext 5028 (crystal
filters from 15 to 110 MHz, with BW 0.01 to 5% of center freq. Also
cesium frequency standards for a really stable external VFO.)

Crystal Technology, Inc. Palo Alto, CA 415-856-7911 (SAW filters at 70 MHz
but with BW @10 MHz)

KVG c/o Jack Husney & Assoc Boca Raton FL 407-393-7548 (a huge selection
of discrete and monolithic crystal filters with some at 45 and 70 MHz.

Philip Munts, N7AHL
University of Alaska, Fairbanks.

My own stupid opinions are just that.

3790. Video inversion

Newsgroup: rec.ham-radio

Message-ID: <2621@lgnp1.LS.COM>
Source record: 15815
Cross-posted to: sci.electronics,rec.ham-radio

Hello Net,

I am looking for a chip or discrete circuit that I could use to
invert the video(and sync) from the video output of a vcr to the
video input of a (wireless/uhfch14) 'rabbit' device.
and at the other end re-invert it between the 2nd vcr & the monitor.

My neighbors have mentioned to me that they are receiving a channel 14
some nights :-) ... well ... Maybe I don't want them to know what movies
I watch ;-) :-)

I'd prefer a chip that don't need too much support circuitry, but a
simple discrete circuit would be just as good. I'm not picky ! :-)

I checked an 'RCA' 'SK' cross reference book , but didn't see anything
close... how about it? anyone have a GTE/Sylvania Motorola or other
cross ref books to see if they carry anything?

Please email to : bfalcon@ls.com or [uunet,rutgers]!lgnp1!bfalcon
I'll repost , if there's any interest.

Thanks much guys/gals/??

anyhoo, have agood one, and I'll catchya later, Bob Falcon

If my understanding is correct, there shouldn't be any problem running
full power while running AMTOR ARQ. When I was using my TS520SE for
AMTOR I always ran it close to max. I beleive that because of the low
duty cycle of AMTOR transmissions you wont have the heating problems as
you would in RTTY or FEC mode. At least I never had any problems.

John

RTTY DX notes for week ending 3rd November 1989 (BID RTDX0311)

I saw a funny thing the other day from a packet station, who complained
about deliberate QRM on 21097 KHz (which is 21095 KHz Mark frequency
plus 2.1 KHz Mark tone). Did not the poor child realize that was the
W1AW frequency they had been using for the past 50 years, four times a
day? Or must the ARRL now move to suit the foibles of the packet
operators? Life gets very hard these days.

Our thanks this week go to I5FLN, OD5NG, VE3JPC, VK2EG, W1DA, W2JGR and
W0LHS. Thanks chaps for your assistance.

QSL Information:

TU2BB will QSL via N2HOS. There will be a slight delay while the logs
are received and the QSL cards printed, so don't get too anxious.

S92LB, Walter, DJ6QT, will print the QSL cards on his return to his home
call of DJ6QT.

A35VB cards go via OH3GZ.

TR8KMJ receives his QSL cards from Box 129, Port Gentil, Gabon.

FP5HL says to send his cards to Box 1107, St. Pierre.

YN4JR QSL address is Box 122, Jinotepe, Nicaragua.

ZD7CW will QSL via N4CID.

HL1SX QSLs via C.P.O. Box 162, Seoul 100-601 Korea.

9M8AX says to QSL to JA5DQH.

9K2KA says to QSL to Box 30, Safat, Kuwait.

Notes of Interest:

Apparently Walter had an expensive trip to Sao Tome. He will produce the QSL cards, and possibly let us all know the details on his return.

OH2BGD and group will start operating from ZK3 on 4th November.

EA9JV is still reporting that he will be operating from S0 (Western Saraha) from 13th to 16th November.

A group of five, including KA8TKB, WB2KXA and KB2XS are planning an East Malaysia trip and will operate 9M6BS from November 16 through 23rd, then V85 November 24 through 27, and November 28 through December 4. They will sign VS6 and XX9. QSL via N2OO.

GL DE DX1 (VK2SG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.

Subject: airport security

Since the "classic curly wire" seems to be the thing to catch the eye of the security folks, perhaps this is how I will be able to test just how well they can see through those lead lined film shields. One would be stupid to put something that even looked like a gun in there just to test them, but putting a coil corded microphone in there along with a few rolls of film might be the real test. If they consistently let it pass, and catch the coiled cord outside of the bag, then I will assume it is not the case that they can see inside the bag. I'd hope they'd recognize that the bag is blocking their view and ask to open it for a visual inspection (to make sure I'm not trying to slip in a gun by that method).

Subject: How to use the incoming QSL bureau?

Ok, I admit, I'm one of those people who doesn't have an
envelope at the QSL bureau. How does the bureau work?
I occasionally work DX on the HF bands, and would like to
use incoming and outgoing QSL bureaus. I am an ARRL member,
so that's not an issue.

Subject: QSLs and SASEs

tad@ssc.UUCP (Tad Cook KT7H) says:

I know several active hams who do not QSL. One is K7SS. (The exception is
his recent Guemes Island operation). When he is working them at the rate of
180 per hour in a contest, his rate and score would go down considerably if
he had to explain to each one that he does not like to QSL.

When I decided to be patriotic and get a WAS, I reckon I got a 95% return
rate on cards by sending them with an SASE and enclosing a note mentioning
that I was asking for the card for the WAS. It would never have occurred
to me not to send an SASE. But K7SS (mentioned above) was one of the many
who did reply - in fact, he sent me cards for two of the 50 states, as he
operated two contests from different places. So he is a Good Guy in my
books!

However, what bugs me is *not* having to send SASEs, but the people who do
not reply when you do send them an SASE. Not to get libellous here, but I
need MD on 160, and W3LPL wouldn't reply to a card. KQ2M never replied
to 3 requests for cards for his HD5X operation, and I still need that on

80m. I realize these are Big Contesting Types, but the least they could do is make up a simple note saying "sorry, I do not reply to QSLs", stick it in the SASE and send it back. Surely they have to open their mail to find out whether it contains a QSL card? What do these guys do with the SASEs? I have visions of them sitting in the near-dark (too mean to turn the light fully on), gleefully peeling the stamps off the SASEs, chuckling as they throw the QSL card on the meagre fire, then pulling out their sack full of unused 25c stamps and counting them again. Perhaps instead they sell the SASEs for 24.9c each to the neighbors.

I think the policy is pretty straightforward. If you really want the guy's card, send him an SASE. If you don't care much whether or not you get a card back, send it postcard rate for 15c and then don't complain if you don't get one back. But if you get my card and an SASE and ignore it, you are a Mean Guy. My only revenge on such people is not to work them when I hear them in later contests - I suppose I secretly hope that one of them will be pushed into 11th place by one point (the one I didn't give them in the contest), and not get listed in the little QST Top Ten box. Hee hee, drool drool....

?HOW CAN I FIND OUT THE TIMES OF BROADCAST AND FREQUENCY, FOR ISRAELI RADIO?

I, too, need this information. Is this the correct group? In my case, I need a simple receiver that will tune in the BBC and Norweigan SW broadcasts. It would be nice if it operated from 220v/50Hz power, as well as US power. Really important that it have preset tuning positions, since it will only be used for a finite number of stations.

This receiver will be used in both Norway and the Seattle, WA area.
Thanks loads, in advance.

(Tad Cook)
Subject: Trend towards requiring SASEs for domestic QSLs?

N4NMR talks about the cards he throws away at the W4 bureau that are for
hams that don't want to receive cards. He asks why they don't tell the
DX hams during the QSOs that they do not QSL.

During a contest this is not easy. I know several active hams who do not
QSL. One is K7SS. (The exception is his recent Guemes Island operation).
When he is working them at the rate of 180 per hour in a contest, his rate
and score would go down considerably if he had to explain to each one that
he does not like to QSL.

I know one thing that has cooled is interest in QSL cards is that here in
the Pacific NW, we seem to have a pipeline to JA. After a contest, it
seems that EVERY JA wants your card for EVERY QSO, no matter how many
times he has worked you before.

I try to QSL 100% to those who QSL me, and I keep my cards sorted. It
is incredible to me how many cards I have for some JA hams....some will
send 5 or 6 cards.

One ham I know who is an active contester (N7TT) sends QSL cards for ALL
of his DX contest contacts. At the end of a contest, he hires a neighbor
kid to make out QSL cards for all the contacts, and sends them via the
outgoing bureau. I know some hams have it all computerized and just
print labels at the end of the contest.

When I did my operation on Guemes Island, I worked 3,000 stations. I
answered everyone who sent me an SASE. But I was amazed at how many
QSLs I received with no SASE. I guess these guys who heard us working
them at the rate of 2 a minute thought we were going to spend another
few hundred dollars to address envelopes and pay postage to QSL
everyone....or maybe they just weren't thinking. They are still in
the drawer, and I may answer them via the QSL bureau...but I wonder how
many of those guys actually keep envelopes at the bureau?

Subject: Tuning dipoles and antennas.

Tuning/resonating dipoles - well i never try resonating for lowest SWR.
Remember, a low SWR doesnt mean anything as far as radiation efficiency
or resonance are concerned (if you like, put a dummy load on the end of the
coax - nice low SWR but it wont radiate very well :-)

The thing to do is trim for RESONANCE - you measure this with your trusty
dip oscillator. Get the dipole resonant at the frequency you want, then
squirt some real RF up it. Dont worry about SWR. You'll put out a far better
signal with a resonant antenna and 2:1 SWR than you will with a non-resonant
antenna and a 1:1 SWR, all other things being equal.
After all, the power 'reflected' by a non-perfect antenna match should be
're-reflected' back to the antenna by the PA tank circuit.
If you have a solid-state PA or linear, then buy yourself an antenna matcher
to keep it happy.

Also, remember that the workable bandwidth of a dipole is related to the
ratio of length to cross-section. Trying to get a good match across the
whole of 3.5 to 4 MHz with a 'thin wire' dipole is just not possible.

Making each 'half' out of several wires spaced a few inches apart will help
here.

>
> >goh<
> (kawai@csli.stanford.edu [arpanet]) (76056,1726 [CompuServe]) (n6uok [radio])

These bureaus are operated by clubs on a volunteer basis. The one I am
familiar with (somewhat) is the 7th area bureau. They get together about
every month and go through the mail. Different members have resposibilties
for different letters of the alphabet. So how I get my cards depends on
the time and work of the guy responsible for the H section.

If you mailed your letter a month ago, don't worry. There isn't a staff
of clerks on hand to answer all the mail.

Also, for anyone else reading this, don't assume that they all will take
checks and send cards. Most want ONLY 5 by 7 1/2 inch SASEs with your
call in block letters in the upper left hand corner. Generally the more
postage you put on, the more they wait to fill up the envelope. I put
on 65 cents (3 oz) and always get away with more weight. The also like
small contributions.

For more details, it is covered once a year in the Hows DX column in QST,
and there is a good outline on page 5-16 in the ARRL Operating Manual.

3797. Havana Moon's "Los Numeros" On-Line

Newsgroup: rec.ham-radio
Date: 1989-11-06 00:11:23 UTC
From: Havana_-_Moon@cup.portal.com
Message-ID: <23733@cup.portal.com>
Source record: 15822
Cross-posted to: rec.ham-radio,sci.crypt,sci.electronics,alt.bbs

Now open - for a sneak preview - on Portal*

HAVANA MOON's "LOS NUMEROS" ON-LINE

* *

** WHAT IS "LOS NUMEROS" **

"Los Numeros" is an old Shortwave tradition - it's been around in one form or another - since the days when HAVANA MOON first hit the Radio scene!

It first appeared as a column in the Newark News Radio Club Bulletin and later in Monitoring Times. Havana Moon and "Los Numeros" claim a large and loyal following among hobbyists and professionals alike.

This newest "Los Numeros" is a full featured magazine-format Shortwave Listening Conference based on an internationally accessible computer system operated by the Portal* Communications Company of Cupertino, California.

"Los Numeros" On-Line brings quality, immediacy and relevant information to the serious Shortwave Listener - and it does something no other communications or monitoring publication can do - it provides a unique opportunity for the subscriber to interact one-on-one with the Experts!

"Los Numeros" On-Line is the perfect blend of two of the world's most exciting and fastest growing electronics hobbies - Shortwave Listening and Personal Computing.

It features Articles by the Experts in radio and related fields, Radio-related Software, Club Information, Special Interest Groups, Intelligence Updates, a Crypto Corner, On-Line Newsletters and much, much more.

"Los Numeros" On-Line selected the Portal* system because of its unique characteristics, including a friendly user interface, on-line documentation, flexibility - and aboe all - its affordability.

Additionally, Portal* provides "Los Numeros" On-Line subscribers with access to its E-Mail Gateways to UUCP, ARPA and BITNET.

Portal* is linked to The Usenet, an internationally distributed conferencing network which spans four continents, 30 countries

and tens of thousands of users on over 7000 computer systems.

"Los Numeros" On-Line is tomorrow's technology today - we hope to see you as part of this continuing tradition!

** WHO IS HAVANA MOON? **

Havana Moon is the pseudonym of a very well known figure in Shortwave Radio, on both the hobby and the professional levels. He is a former Intelligence Officer who is acknowledged to be one of the leading experts in the curious shortwave phenomenon known as "Spy Numbers Transmissions."

He has written two popular books, "Uno, Dos, Cuatro - A Guide To The Numbers Stations" and "Los Numeros: The Numbers Stations Guide" both published by Tiare Publications of Lake Geneva, WI. "Uno, Dos, Cuatro" has been reviewed numerous times in such publications as 73 Amateur Radio Magazine, Cryptologia, Fact Sheet Five, The Fessenden Review and the National Intelligence Book Study Center.

He has authored hundreds of articles which have appeared over the years in the major radio monitoring and related publications, including Monitoring Times and Popular Communications. He is currently a contributing editor to a number of well-known publications, including Popular Communications, The A*C*E Bulletin, The Intelligence Newsletter and Umbra et Lux. He is presently Clandestine Consultant to Popular Communications and has contributed recently to Grove Enterprises' "Shortwave Directory."

Havana Moon was featured in Sharon Churcher's "USA Confidential" column in the December, 1988 edition of Penthouse Magazine. He has done numerous radio talk-shows, most recently the Pat Murphy Show on Norfolk's WNIS. Another is scheduled for the very near future with Jonathon Marks of Radio Netherlands.

** A PEEK AT THE TABLE OF CONTENTS **

. FEATURES by some of Shortwave Radio's best known authors, including Harry Helms' *Secret Shortwave Spectrum*, Dr. John Santosuosso's *Political Ponderings - The Politics Behind Shortwave Broadcasting*, Gerry Dexter's *Clandestine Confidential*, John Arthur's *Veried Response*, Kirk Baxter's *ACE Digest* and Havana Moon's *The Numbers Stations Log*, to name just a few.

. DEPARTMENTS which provide an opportunity for interaction - including TALK BACK, What's HOT!, The RF "Source", HM's RF Curiosity Shop, Ye Olde SWL FRiendship Connection and lots more.

. Program schedules and frequency listings for some of the major English-language INTERNATIONAL BROADCASTERS.

. A DATABASE of downloadable software for Commodore, IBM and Mac users - free for the taking.

. FORUMS for a dozen or more Special Interest Groups, including Antique Radios, Covert Communications, HF Aeronautical Radio, Pirates, DXg and Utilities, to name just a few.

. On-line NEWSLETTERS including Harry Helms' red hot *Umbra et Lux, Eli Messinger's *Radiogram* and Radio Sweden's *Sweden Calling DX'ers*.

. HAVANA MOON Y AMIGAS - monthly real time teleconferencing with the experts.

. A QUARTERMASTER'S DEPOT with on-line offerings by some of of Shortwave Radio's major publishers, distributors and manufacturers.

. Message Boards for Radio Clubs including ANARC, A*C*E and NASWA.

3798. SW frequencies list wanted

Newsgroup: rec.ham-radio
Date: 1989-11-06 03:16:43 UTC
From: jmcvey@hpdml93.HP.COM
Message-ID: <530008@hpdml93.HP.COM>
Source record: 15823

I have a SONY 2001 Radio and like to listen to shortwave. However, I don't know what frequencies to listen to, so I usually spend most of the time just hunting around. I bought the Radio Shack (no flames please) guide to shortwave listening and was disappointed. Is there a good listing of SW stations out there somewhere. I would think the list should be posted to this group. It should have broad interest.

Thanks in advance,

John McVey

Source record: 15755

I'm sure there are a number of you out there who, like me, tend to prefer the basic crystal oscillator/VFO style of radio that preceeded the synthesized lot that makes up 95% of the market today. I'm looking for a replacement for my Kenwood TS-140, and I'd like to get some input on what radios, new and used, you think offer the best performance. In new there's not much aside from the Ten-Tec Corsair and (sort of) new Omni, but a few years ago *everything* was this way.

My own favorite of recent years was my ("why did I sell it?") Swan 102. I'm currently on the lookout for something like a 103, or perhaps a recent Ten-Tec, but before I jump I'd like to get input from the experts out there. What non-synthesized radios have you owned? What were the plusses and minuses of each? How user serviceable were they? Send me your comments direct, and I'll summarize to the net.

Not too long ago there was an article in one of the magazines written by
a guy who was becoming an expert on squeezing cards out of people. He
recommended that in extreme cases you include not only a SASE, but one
of those blank, generic QSL cards found in ham stores. This gives the
person all the info (your card) a card and a reply envelope. I don't
think he sent a pen, but he's proabably doing it by now.

Group,

Have any of you had experience with the $350-400 oscilloscopes
sold under name like "elenco" and so on? They are dual trace 20MHz scopes
that look okay from the ad. Heathkit now has a version (assembled) for
about the same price. The ads are in the back of ham and radio mags. One
source is "C & S Sales". Any comment

Hi All|
Just got a query from a friend who runs satellites ...
He wondered, what is the satellite on the ham band 432.875 ?
He said it is not a amateur satellite and he had some note
which told that the satellite might be "polar bear"
recearch satellite launched by US.
he just wondered what is the reason for it sending in a ham band ...
Any information appreciated|
Best regards and 73's from Antti-Pekka OH1YF

>>I will be interested in finding out if it is bona fide or not.

The FCC Forum at the Houston Com-Vention this last weekend was run by
the local FCC field people.

They knew about a letter that the FCC sent to several people influential
in the situation. They said it was genuine.

>Well, lying or making that letter up would be "false or deceptive
>signals" which is illegal, so I kinda suspect that N4WBO did NOT make it
>up. He said that he got it off of compuserve; perhaps somebody could get
>on to compuserve and get a source, and maybe we of the net can verify it?

If someone would mail me a copy (I didn't save it), I'll float it past
the locals and find out for sure.

They did say that their opinion was that using ham radio for supporting
the missionaries (the specific example used was "We need more bread out
here") in the manner of the IMRA net, and that using ham radio to run
phone patches to avoid telephone toll charges in the manner of the MM
Net, were both illegal. They went on to say that they'd hoped that the
hams would settle the issue themselves, but it looked like FCC action -
which they expected to include a ban on international third-party
traffic - would be needed.

> _Eric Cook_

From "A Biography of Mark Shepherd" in the _TI Technical Journal_
of March-April, 1988:

"While TI believed in the future of solid-state electronics, it still needed to prove to a skeptical world the practicality of transistors and TI's ability to produce them. In 1954, TI entered into a joint program with the Regency Radio division of Industrial Development Engineering Associates, and Mark's operation was charged with getting into production a radio made with germanium transistors by October of that year in order to place it on the market by Christmas."

"The result -- the Regency Radio -- opened the commercial market for transistors by showing it was practical to use the small components in mass-produced consumer products. For three years, TI was supplying transistors for almost every portable radio manufactured in the United States."

After a couple of phone calls to Dallas, we found at least one of the original engineering prototypes in the hands of one of the design team.

3807. IC28 squelch mod

Newsgroup: rec.ham-radio
Date: 1989-11-06 14:54:06 UTC
From: rfc@briar.philips.com
Message-ID: <67468@philabs.Philips.Com>
Source record: 15741

copied from packet:
Subject: Icom IC-28 squelch modification

The long, noisy squelch-tail of the Icom IC-28 (A or H model) 2-meter transceiver can be shortened by replacing C110 (4.7 uf) with a smaller value (0.1 to 0.47 uf). (I can't remember the source of this information.)

I put a 0.33 uf in my IC-28H; it's a very worthwhile modification.

The capacitor is on the bottom board (the one with the lithium battery), just southeast of IC4 as you face the front of the upside-down radio. The only difficult part is finding the right p-c pads to desolder on the back of the board.

To remove the board: Remove bottom plate, unplug speaker. Unplug coaxial antenna connector (gray wire). Other connectors may remain in place. Remove 5 mounting screws, one in each corner and one near center. Tilt the board out of the radio. The button in the upper left corner is CPU reset; you may have to reprogram the memories if it is pressed. Remember that, although the radio is off, parts of the circuit are still "hot" because of the memory-backup battery, so be careful not to short any part of the board during the modification.

Re the question of "does interference really occur": yes. A few years ago I operated air-mobile with a friend. He was flying the plane (a two-seater). This was VFR, but as usual the Nav radios were on. Whenever I hit the PTT, on my 1 watt 2 meter radio, the red flag on the VOR readout came up. No problem
in this case, but you can see why I won't operate air-mobile when IFR is in effect. (And I understand why there are rules about operating air-mobile while flying IFR in the FCC part 97 rules...)

People who operate cellular phones and the like on commercial flights should be prosecuted to the full extent of the law. (Maybe it would help to charge them with attempted homicide!)

On the opposite point: I too wonder why aircraft gear is so poorly protected from EMI. Perhaps its because it tends to be old technology. Ask sometime how the transponder ("squawk") works, it will make your hair stand on end...

In the case of W3LPL, he does not operate the station during contests.
He has some one else operate the station and the trick is to find out
who the operator was and QSL to the operator. I am not sure W3LPL ever
operates his station, probably just rents it to operators that like to
run up a big score for some one. My experience with W3LPL has been
nothing but negative. I worked the station and tried to get a card.
Then one day I happened to work one of Frank's neighbors and he mentioned
that Frank NEVER answers his mail and you have to QSL to the operator.
I need a card from W3LPL for the CQ WW RTTY contest. Guess I will have
to wait until the results are posted and try to get a card from the
operator. I sent Frank a nice letter with a SASE asking the name of the
operator, but of course he never bothered to reply. Wish we could start
a movement where the big contesters that do reply to QSL get there logs
rejected and can not submit until the past due QSL's are mailed. Or maybe
a column in QST where you can send in the list of stations that refuse
to reply to SASE's so everyone can find out who does not reply so you
wont bother working them. Sort'a like a DX manager's list, but for the
stations that don't QSL.

>

Well, I'm still just a wannabe (who may actually get there, this time), but
since this (being able to work a friend of mine who spends a number of

months/year at sea) is one of the reasons I'm getting to ham radio again, I feel like I can (and should) comment.

There are some interesting things we can learn from this; I've pointed out a couple above. I have no doubt that the FCC will (eventually) act, and that the majority of hams WILL NOT LIKE the action they eventually take. My view of the FCC is sorta like a sleeping bear who's letting letting you borrow a part of HIS cave. If you wake him up, he's likely to be grumpy, unless it was a for a good reason. If you woke him for a SILLY reason, or because you and the kid in the next cave couldn't settle a dispute about your toys, he's gonna be ANGRY and he'll probably take the toys away from BOTH of you, so NOBODY wins.

My opinions.....

Clay Jackson

Norm Strong asks for recommendations on SW radios under $200 and is constantly referred to the Sony 2010. It really is worth saving for; an even better feature that is not found on ANY other receiver is this ECSS mode that permits better reception-don't ask me to explain it, I'm only a librarian!! Anyway, there was one recommendation for the Magnavox 2935 that has been discontinued by the manufacturer; EEB's price was quoted but this model is carried by Sears and I've seen it in Erie for $178. Good sound. This new Panasonic RFB-65 sounds good and I think you can find it for $200, but I may be wrong, which is often, but at least I try and look good, which is not bad, considering...done!

As Igor Kronikoff quotes a famous Doggonian proverb, "you can't get caviar from a possum!"

3817. Re: Units of Measure (was flu

Newsgroup: rec.ham-radio

From: koning@koning.dec.com
Message-ID: <5959@shlump.nac.dec.com>
Source record: 15735

Are units of measure arbitrary? In some sense, yes. There is no fundamental reason why feet are better, or worse, than meters. Nor are they better or worse than units derived from the fundamental constants.

Many people don't realize that the definition of units (and their standards) is a pragmatic activity. The reason why the standard for the meter, or the second, is what it is today has NOTHING to do with philosophy or considerations of fundamentalness. The only consideration is precision. The requirement on a standard definition is that it offers the best available compromise of accuracy, reproducibility, and availability. The standard kilogram isn't readily available, but its reproducibility is so much better than any alternative that it is still the choice. The standard for the meter has changed several times over the past decades to track the state of the art. When length measurement by interferometry became practical, the meter was defined in terms of wavelength. When it became possible to measure the frequency of visible light accurately, the meter was redefined in terms of the velocity of light (which is what defines it today).

The key difference that sets the (SI) metric system apart from all the others is that it defines a complete and consistent system of units. The earlier metric systems (CGS for example) come close. The "US conventional" system isn't even in the running, which is why it is being generally abandoned in industry and was abandoned long ago for many scientific applications.

paul, ni1d

PS. To answer an earlier question:
peta (P) = 10^15
exa (E) = 10^18
also:
femto (f) = 10^-15
atto (a) = 10^-18

I've got an "interesting" dilemma. I need to move a 5 1/4" floppy drive OUT of my system box and into an external unit. So, I need a box with a power supply and a set of adaptor cables of some sort. The controller I propose to use is an IRWIN 4100MC (as in MicroChannel). It has a 50 pin connector on the backplate, and their documentation claims that it will drive an external floppy.

The floppy is a 5 1/4" half height 1.2 Mb drive. The machine it's coming out of is a Tandy 5000MC, which is, for all intents and purposes (except some physical size problems) a PS/2 Model 80 clone.

Thanks!

Microsoft

3820. Product Review: HMC-2 VOX HEADSET

Newsgroup: rec.ham-radio
Date: 1989-11-06 19:40:21 UTC
From: cep4478@ultb.UUCP
Message-ID: <1568@ultb.UUCP>
Source record: 15728

Hi!

I usually like to write up what I think after I buy new
radio toys for the net to read. I wish _everybody_ did this!

I purchased one of the vox microphone/headsets from Kenwood,
for my TH-215A handheld. I have thus far been very happy with the
handheld, and also own a hand mic (SMC-30, the full-size model) which
I am very happy with.

The headset turned out to be a little different than I had
expected. The one made by ICOM is the 'usual' style - it is styled
just like a high-quality pair of walkman headphones, except with only
a single speaker and the microphone boom. The HMC-32 has a very light
headset, with no speaker on it: you listen with an attached in-the-ear
speaker - it is similar to the new style stereo headphones, sitting
in your outer ear (not ear canal).

The speaker quality is fairly good, though it has much less
high frequency response than the hand speaker-mic does. I'm not sure
what effect this will have when I'm driving in my noisy car, but at
any rate incoming audio is perfectly understandable. By far the
biggest ADVANTAGE of the in-the-ear style plug is that it lets in
sounds from your environment when the speaker is silent: if there is
nobody on the frequency, then you can still hear your world around you.
The disadvantage is that it's fatiguing to have the thing sit in your
ear, especially if you've got a smaller ear, and after an hour or two
you REALLY want to yank it out, or switch the headset to the other side.

I have gotten EXCELLENT reports on my audio so far. This is
partly due to a high-quality microphone, but is mostly because it
stays a fixed distance from your vocal apparatus. As usual, VOX
takes some time to get used to. The vox delay is not adjustable,
and is about one second. Adjusting vox sensitivity is not bad,
either - on the TH-215, you can put arrange it so that with TX LOCK
on, the radio will 'beep' to let you know that you tried to transmit,
so by noticing where the beeps occur you can quickly learn how to
speak so as to not let your first be syllable chopped off.

Finally, construction: it's all plastic (isn't everything
these days). You can turn vox off and use a PTT switch built into
the vox unit, and, as usual, this PTT switch seems to be made to
last through many excited QSO's. However, the switch that disables
VOX is not too impressive, and being a switch I'm likely to use a lot
I will certainly keep my eyes on it, because I don't trust it much.
Also, since this type of headset sits ABOVE the ear, it would be

nice if the boom were a little longer.

The only other note is that it would be really nice to have an LED on the top of the microphone to let me know when I am transmitting. I know for certain that this is possible: Kenwood's miniature speaker microphone has such an LED, and I suspect that a 0.7v drop wouldn't hurt performance too much. (the vox unit is, of course, powered by the HT).

Well, that's my $0.02 on the matter. If anybody else owns one of these things, please drop me a note re: what you think of my comments on it. In general, I've been VERY happy with my TH-215, and all the accessories that I have, so the vox headset was a little less thrilling than I had expected, but if I decide to return it after a week's usage, it'll be for financial reasons rather than quality. Very few people own these things, I notice - probably because I look like a SERIOUS geek when I'm wearing it. (It's mostly for the car, and when I'm typing).

de Chris, N2JGW

Rochester Institute of Technology
Amateur Radio Club, K2GXT

These opinions are my own, and have nothing to do with Kenwood or any other company, nor the Rochester Institute of Technology, which has no opinions that don't relate to degradation of student life and last dime.

3821. Kenwood RZ-1 Wide Band Receiver

Newsgroup: rec.ham-radio
Date: 1989-11-06 21:14:20 UTC
From: eb@lucid.com
Message-ID: <2154@heavens-gate.lucid.com>
Source record: 15739

I'm considering purchasing the Kenwood RZ-1 mobile receiver, which I read about in the 1989 World Radio TV Handbook. My main interest is in FM and TV audio broadcast reception in my car, which is difficult in the Bay Area due to the hilly terrain. I would also used it for shortwave listening, and a perhaps a little bit of police band monitoring (like when the next big one hits!). Does anyone have any personal experience with this unit, or knowledge of other reviews that have been published? Does anyone know of any competing units, or whether Kenwood has a follow-on product planned?

Thanks for your help.

3822. Re: Product Review: HMC-2 VOX HEADSET

Newsgroup: rec.ham-radio
Date: 1989-11-06 21:21:27 UTC
From: cep4478@ultb.UUCP
Message-ID: <1569@ultb.UUCP>
Source record: 15729

Oh yes, I forgot to mention two observations about vox headsets (in general).

(1) if you're full-quieting into a repeater, sometimes people start talking back to you before the vox drops PTT. This is probably because most people don't hold PTT for a full second after they're done talking. I noticed this by accidentally flipping to a repeater I don't normally use, one without a courtesy tone. The courtesy tone is a big help with the vox.

(2) I am going to have to learn better control on the highway. I don't mean about handling the radio, nor about my driving, I mean about screaming "GET OUT OF THE %*@$& WAY, YOU STUPID *!#@$& BABOON!!!" when a friendly fellow New Yorker tries to give me some of his paint. etc.

Chris

Subject: airport security

I remembered this discussion from before, so last time that I was on a
commercial flight, I brought home a copy of the "Inflight Entertainment
& Information Guide." Here is what United Airlines thinks about
electronic equipment:

Televisions, AM/FM radios, portable cellular telephones, remote
control toys, and similar electronic devices must not be used
on board because they may interfere with communications and
navigations |sic? systems.

No mention of computers, and I sure do see a lot of laptops in use on
flights.

Subject: An Inquiry Concerning Non-Synthesized Radios...

I'm sure there are a number of you out there who, like me, tend to prefer the basic crystal oscillator/VFO style of radio that preceeded the synthesized lot that makes up 95% of the market today. I'm looking for a replacement for my Kenwood TS-140, and I'd like to get some input on what radios, new and used, you think offer the best performance. In new there's not much aside from the Ten-Tec Corsair and (sort of) new Omni, but a few years ago *everything* was this way.

My own favorite of recent years was my ("why did I sell it?") Swan 102. I'm currently on the lookout for something like a 103, or perhaps a recent Ten-Tec, but before I jump I'd like to get input from the experts out there. What non-synthesized radios have you owned? What were the plusses and minuses of each? How user serviceable were they? Send me your comments direct, and I'll summarize to the net.

Group,

Have any of you had experience with the $350-400 oscilloscopes sold under name like "elenco" and so on? They are dual trace 20MHz scopes that look okay from the ad. Heathkit now has a version (assembled) for about the same price. The ads are in the back of ham and radio mags. One source is "C & S Sales". Any comment

I think that I may have a problem with my IC-720A but I would like someone who also has an IC-720A to try this and tell me if they get the same

response or not.

Go to the 20m band and put the radio in LSB using VFO A. Then attempt to store the current frequency in VFO B. When I do this the radio changes to USB!!

I do not want it to do this.

Do ALL 720A's do this or is it just mine?

Subject: Havana Moon's "Los Numeros" On-Line

Now open - for a sneak preview - on Portal*

HAVANA MOON's "LOS NUMEROS" ON-LINE

* *

** WHAT IS "LOS NUMEROS" **

"Los Numeros" is an old Shortwave tradition - it's been around in one form or another - since the days when HAVANA MOON first hit the Radio scene!

It first appeared as a column in the Newark News Radio Club Bulletin and later in Monitoring Times. Havana Moon and "Los Numeros" claim a large and loyal following among hobbyists and professionals alike.

This newest "Los Numeros" is a full featured magazine-format Shortwave Listening Conference based on an internationally accessible computer system operated by the Portal* Communications Company of Cupertino, California.

"Los Numeros" On-Line brings quality, immediacy and relevant information to the serious Shortwave Listener - and it does something no other communications or monitoring publication can do - it provides a unique opportunity for the subscriber to interact one-on-one with the Experts!

"Los Numeros" On-Line is the perfect blend of two of the world's most exciting and fastest growing electronics hobbies - Shortwave Listening and Personal Computing.

It features Articles by the Experts in radio and related fields, Radio-related Software, Club Information, Special Interest Groups, Intelligence Updates, a Crypto Corner, On-Line Newsletters and much, much more.

"Los Numeros" On-Line selected the Portal* system because of its unique characteristics, including a friendly user interface, on-line documentation, flexibility - and aboe all - its affordability.

Additionally, Portal* provides "Los Numeros" On-Line subscribers with access to its E-Mail Gateways to UUCP, ARPA and BITNET.

Portal* is linked to The Usenet, an internationally distributed conferencing network which spans four continents, 30 countries and tens of thousands of users on over 7000 computer systems.

"Los Numeros" On-Line is tomorrow's technology today - we hope to see you as part of this continuing tradition!

** WHO IS HAVANA MOON? **

Havana Moon is the pseudonym of a very well known figure in Shortwave Radio, on both the hobby and the professional levels. He is a former Intelligence Officer who is acknowledged to be one of the leading experts in the curious shortwave phenomenon known as "Spy Numbers Transmissions."

He has written two popular books, "Uno, Dos, Cuatro - A Guide To The Numbers Stations" and "Los Numeros: The Numbers Stations Guide" both published by Tiare Publications of Lake Geneva, WI. "Uno, Dos, Cuatro" has been reviewed numerous times in such publications as 73 Amateur Radio Magazine, Cryptologia, Fact Sheet Five, The Fessenden Review and the National Intelligence Book Study Center.

He has authored hundreds of articles which have appeared over the years in the major radio monitoring and related publications, including Monitoring Times and Popular Communications. He is currently a contributing editor to a number of well-known publications, including Popular Communications, The A*C*E Bulletin, The Intelligence Newsletter and Umbra et Lux. He is presently Clandestine Consultant to Popular Communications and has contributed recently to Grove Enterprises' "Shortwave Directory."

Havana Moon was featured in Sharon Churcher's "USA Confidential" column in the December, 1988 edition of Penthouse Magazine. He has done numerous radio talk-shows, most recently the Pat Murphy Show on Norfolk's WNIS. Another is scheduled for the very near future with Jonathon Marks of Radio Netherlands.

** A PEEK AT THE TABLE OF CONTENTS **

. FEATURES by some of Shortwave Radio's best known authors, including Harry Helms' *Secret Shortwave Spectrum*, Dr. John Santosuosso's *Political Ponderings - The Politics Behind Shortwave Broadcasting*, Gerry Dexter's *Clandestine Confidential*, John Arthur's *Veried Response*, Kirk Baxter's *ACE Digest* and Havana Moon's *The Numbers Stations Log*, to name just a few.

. DEPARTMENTS which provide an opportunity for interaction - including TALK BACK, What's HOT!, The RF "Source", HM's RF Curiosity Shop, Ye Olde SWL FRiendship Connection and lots more.

. Program schedules and frequency listings for some of the major English-language INTERNATIONAL BROADCASTERS.

. A DATABASE of downloadable software for Commodore, IBM and Mac users - free for the taking.

. FORUMS for a dozen or more Special Interest Groups, including Antique Radios, Covert Communications, HF Aeronautical Radio, Pirates, DXg and Utilities, to name just a few.

. On-line NEWSLETTERS including Harry Helms' red hot *Umbra et Lux, Eli Messinger's *Radiogram* and Radio Sweden's *Sweden Calling DX'ers*.

. HAVANA MOON Y AMIGAS - monthly real time teleconferencing
with the experts.

. A QUARTERMASTER'S DEPOT with on-line offerings by some of
of Shortwave Radio's major publishers, distributors and
manufacturers.

. Message Boards for Radio Clubs including ANARC, A*C*E and
NASWA.

>
>So no excuses, everybody--get those envelopes mailed off to your bureau
>right away! Otherwise you'll never get that ZA card that's waiting for you. :-)
>
NO, NO, NO!!!!!

If you are expecting cards, fine. If you are sending an envelope
"just in case", DON'T DO IT! I, as a sorter, do NOT want envelopes
from every N4TOM, D1CK, and H4RRy. That leads to storage problems
and makes sorting much slower. Only if you are expecting cards, please!

>with cards, and then mail it back to you. Some bureaus mail every
>month or so, whether you have 1 card or 1000 (they don't send empty
>envelopes, however...you gotta have 1), others wait until you have
>a few in the envelope.
>
As QSL sorter, I have been told that I mail out the envelope when
the weight of the envelope plus cards equals the postage on
the envelope. If you want to get cards often (like me, I have
NO patience), you put 25 cents postage on the envelope (good for
5-6 QSL cards). If you aren't impatient, you put on more. (I have

several envelopes with several $$ postage. They may take a long
time to fill and get mailed.)

>>I will be interested in finding out if it is bona fide or not.

The FCC Forum at the Houston Com-Vention this last weekend was run by
the local FCC field people.

They knew about a letter that the FCC sent to several people influential
in the situation. They said it was genuine.

>Well, lying or making that letter up would be "false or deceptive
>signals" which is illegal, so I kinda suspect that N4WBO did NOT make it
>up. He said that he got it off of compuserve; perhaps somebody could get
>on to compuserve and get a source, and maybe we of the net can verify it?

If someone would mail me a copy (I didn't save it), I'll float it past
the locals and find out for sure.

They did say that their opinion was that using ham radio for supporting
the missionaries (the specific example used was "We need more bread out
here") in the manner of the IMRA net, and that using ham radio to run
phone patches to avoid telephone toll charges in the manner of the MM
Net, were both illegal. They went on to say that they'd hoped that the
hams would settle the issue themselves, but it looked like FCC action -
which they expected to include a ban on international third-party
traffic - would be needed.

Looks to me as if ham radio is fast changing (has already changed?)
from a hobby plus real reasons for being (service to charitable
organizations, forefront of technology, relaying across the USA,
etc.) to JUST a hobby.

I'm assuming no one thinks we should wish for more emergencies, but
how long, now, before someone concludes that the relaxation of normal
rules during emergency operation is no longer justified because all
organizations normally served during disasters, etc., should have
planned better for their own exigencies?

Subject: Video inversion

Hello Net,

I am looking for a chip or discrete circuit that I could use to
invert the video(and sync) from the video output of a vcr to the
video input of a (wireless/uhfch14) 'rabbit' device.
and at the other end re-invert it between the 2nd vcr & the monitor.

My neighbors have mentioned to me that they are receiving a channel 14
some nights :-) ... well ... Maybe I don't want them to know what movies
I watch ;-) :-)

I'd prefer a chip that don't need too much support circuitry, but a
simple discrete circuit would be just as good. I'm not picky ! :-)

I checked an 'RCA' 'SK' cross reference book , but didn't see anything
close... how about it? anyone have a GTE/Sylvania Motorola or other

cross ref books to see if they carry anything?

Please email to : bfalcon@ls.com or |uunet,rutgers?!lgnp1!bfalcon
I'll repost , if there's any interest.

Thanks much guys/gals/??

anyhoo, have agood one, and I'll catchya later, Bob Falcon

3824. Re: Tuning dipoles and antennas.

Newsgroup: rec.ham-radio
Date: 1989-11-06 21:35:29 UTC
From: timb@hpmwtd.HP.COM
Message-ID: <1260002@hpmwtlb.HP.COM>
Source record: 15748

It is not necessary to have a resonant antenna to efficiently radiate energy.

If an antenna is matched to the source, regardless of how it is matched, all the energy sent down the transmission line is radiated (neglecting, of course, losses in the line , tuner, traps, etc.).

You need to define what you mean by radiation efficiency. The fact is that the radiation pattern will be different for a non-resonant antenna than for a resonant one. But this may be desirable in certain situations.

If your antenna SWR is 2:1, your losing about 10% of the transmitted power back to the transmitter load! This is power that is not radiated anywhere. Contrast this to a non-resonant but matched antenna which will radiate 100% of the transmitted power (again neglecting losses), albeit, into some different pattern. If the antenna length is only slighty off resonance, the pattern will not be affected significantly.

Even if you tune the antenna exactly to resonance, it is unlikely that it will be matched to the transmission line over any practical bandwidth. This again introduces SWR and a reduction in maximum radiated power.

So I say use a good quality antenna tuner with parallel wire transmission line and don't worry too much about resonating the antenna length.

Here is the latest information on the upgrade for the Kenwood TM721A / 621A...

The upgrade is only for the display and will not add any of the new features found on the TM-731A / TM-631A radios. It will also not add the ability to use the RC-20. (This is interesting to note since they also now tell me (Kenwood service that is) that they do not recommend the RC-20 on the TM-731A/631A, since all functions are not available).

The price is supposed to be less than $100.00 and it is even money if it will be factory only upgrade or if a Ham can do it....

What to do, what to do....

Re the discussion on HT's at the airport. I have done large amounts of travel in the past years with BOTH an HT and a handheld scanner and the only thing that has occured is to be asked to open the briefcase and show them. I haven't even been asked to turn them on to show they work, just let them see them lying in the briefcase. This includes such exciting places as Laguardia (just last week), Kennedy, Ohare, Denver, SFO, LAX, Seatle, etc. I have, more than once, overheard a new security guard ask his/her supervisor, "does this person fit the profile?". One could guess from this that certain people may get hasseled more than others if they "fit the profile" whatever that is.......

>I am about to purchase a Kenwood TS520 HF Xcvr for $375. It is in good shape
>and comes with a mic and all the other necessities. Is it a good deal? Will
>it do AMTOR ARQ?

You might want to check some recent QSTs. The 520 is enough of a commodity
that it appears fairly often. I put an Astatic D104 crystal mike on mine,
and get nothing but excellent audio reports. The compressor works really
nicely, and seems to penetrate far better than one would expect.

I think $375 for 520 and mike is probably not a bad deal.

Source record: 15745

I've used some logging programs before, about 3 different ones (all for PC) and my personal opinion is that they were all trash. Oddly enough the one I thought worked best was written in BASIC by a non-programmer in one evening as just a "quickie". Still I think I could do a lot better. Typical problems with these programs are lack of ability to cancel and abort things that get started, inability to change what's been typed in, and slow disk i/o and dup lookups. If I can get a clear idea of what other people would like a logging program to do, I might try writing one. If I do, it will be freeware. If you want to tell me what you would like in one, start from the beginning; don't say what you would like added to one. How should it work? What info should it keep? What user interface does it need?

3829. Kenwood TS-440s -> KAM Hookup (Help)

Newsgroup: rec.ham-radio
Date: 1989-11-07 02:23:17 UTC
From: noel@ubbs-nh.MV.COM
Message-ID: <161@ubbs-nh.MV.COM>
Source record: 15764

I need some advise on the proper hookup of the Kantronics KAM HF port to
the Kenwood TS-440s tranciever.

I am running the cable from the HF port of the KAM to ACC2 (13 pin DIN)
of the Kenwood. So far I have it working with the exception that when
the KAM toggles the PTT it does not mute the microphone.

As it stands now I have the following wired:

KAM TS-440S

White (1) 11
Black (2) 8
Brown (3) 13
(Red) (6) 3 (Audio Signal, Color is arbitrary)
Green (4) CW jack tip

According to the TS-440S manual, pin 9 of ACC 2 mutes the microphone if
grounded, but how to do it alluding me at the moment.

Thanks in advance for any help.

Source record: 15738

Maybe the quantity to be measured is RELUCTANCE, not in an electromagnetic connotation, but in the reluctance for people to give up what they've grown up with in expressing themselves.

I'd almost be like someone coming in and saying YOU GOTTA SPEAK PIG-LATIN FROM NOW ON! No matter it's better, more concise, more eloquent, more poetic, etc., IT JUST AIN'T WHAT WE'RE USED TO.

I learned MKS and CGS and SI in physics... started in Jr. High School... and can appreciate the value of them 'cause some of those values that are dealt with are inconvenient in FPS... (What *IS* the speed of light in Furlongs per Fortnight?)

I once tried to teach the metric system to my dad... looking back as the frustration is now just memory, it was pretty funny.

I wonder if some of that RELUCTANCE is the force we've seen exhibited when the FCC or someone suggests some change to the Amateur Radio Service? (For example, the Novice License... Incentive Licensing... No-Code... whatever...)

Regardless of the pros and cons of any new idea, there is an almost tangible force opposing it.

Interesting observation, IMHO, about the nature of the critter H.Sapiens...

73,

Bob WA8YCD

I'm sorry, but the scenario you have portrayed is bogus.

Commercial FM broadcasting did not begin until 1940, and the FM broadcast band so allocated by the FCC was 42 to 50 MHz. The present FM broadcast band of 88 to 108 MHz was not allocated until 1944, and did not see significant use until 1946 since prior to that time wartime materiel controls did not permit the manufacture of radio receivers for consumer use. Portable FM receivers did not see widespread manufacture until the late 1940's.

During the 1930's aircraft "navigation receivers" were essentially limited to the reception of beacons in the frequency range of 200 to 400 kHz, and the direction finding of said beacons and commercial radio stations in the overall frequency range of 200 to 1,600 kHz. Range receivers were also employed in the frequency range if 200 to 400 kHz, and relied upon the _aural_ detection of signals with "A" and "N" AFSK morse code to achieve a navigational reference.

The first commercial use of VHF for civilian aircraft navigation did not occur until 1939, when the "Z-marker" system was implemented on a frequency of 75 MHz. Z-marker receivers were intentionally NOT sensitive, and were designed for a sensitivity of 2,500 microvolts.

The use of VOR, and VHF localizer and glide slope apparatus for civilian aircraft did not begin until 1946.

If you have some specific details of this alleged "crash in the late 1930's", then please furnish them; if not, I am going to dismiss your story as an old wive's tale.

> Check Aviation Week for other examples.

Since you imply that such examples exist, perhaps you could furnish us with a few. I am aware of the situation involving a cellular telephone in a baggage compartment which allegedly activated a fire detection system; I know of no others, however.

> The bottom line is that radio equipment on a commercial flight simply is a
> risky thing to do, even if the pilot knows about your transmitter/receiver
> there may well be another he DOESN'T know about. The consequences just to
> play games are just stupid.

I do not disagree that receivers and transmitting apparatus should
not be used by a passenger on any commercial airline flight. The only
reason that should concern anyone about WHY such use is prohibited is that
it is unlawful since it violates a very specific FAR section.

My personal opinion is that it is improbable that local oscillator
radiation from any commercially available receiver or receiver portion of
a portable transceiver will cause any interference to any aircraft
navigation apparatus in use today. The use of a transmitter, however,
is a totally different matter, and could conceivably affect a variety
of non-radio flight instrumentation and controls through RFI susceptibility.

However, debating this point is senseless unless one is attempting
to convince the FAA to rescind the FAR which deals with the use of electronic
apparatus by passengers on commercial aircraft. My personal opinion is
that the FAR is just fine as it is, since surely any rational ham radio
operator, aviation or scanner "enthusiast" can live without their radio
for the short duration of an aircraft flight.

Source record: 15751

455KHz IF's - well in Europe, 470KHz seems to have been popular with the indigenous BC-band receiver-makers, but since most of these have now either gone bust or market Eastern imports badge-engineered, theres been a trend to 455KHz.
As has been said, there can be problems with images being received, despite the front-end selectivity (remember, the image is 2*the IF - this is typically a ratio in frequency terms of 2:1 from the 'intended' reception frequency. Even a poorly aligned ferrite loopstick antenna provides adequate image rejection in most cases).
Some of the early solid-state AM auto radios (Philco - as fitted to Ford cars in the late 'fifties) used an IF of about 235KHz. These radios often had 12-volt tubes for the frequency changer and used germanium transistors for the IF, and a single class 'A' power transistor for the audio output. This was convenient for the manufacturers since the early germanium transistors werent the gainiest of devices and high-frequency (over 500KHz) operation was fraught - you had to neutralise each stage independantly, and it changed with temperature!
I remember using one of these auto radios as an 'IF strip' tuned to 1.6MHz behind a simple 2-stage tunable front-end (6AC7 rf amp, 6BA7 mixer, 12AT7 VFO) because having a 235KHz IF, it was that bit more selective than a radio using 455KHz.
Also, being an auto radio, it was well screened so pickup at the 'first IF' was never a problem.

You want to get hold of a copy of the World Radio-TV Handbook.
It has been published every year for nearly (more than?) 40 years, and
is regarded as THE shortwave listener's Bible.

You can order copies of the WRTH from many Radio supply houses.
Two that I can recommend are:

Universal Shortwave Radio, Inc.
1280 Aida Drive
Reynoldsburg, Ohio 43068
U.S.A.
(phone: 800-431-3939 and 614-866-4267)

Gilfer Shortwave
52 Park Avenue
Park Ridge, New Jersey 07656
U.S.A.
(phone 1-800-GILFER-1 and 201-391-7887)

The WRTH retails for $19.95, which any serious SWL will regard as a bargain.

Another source of information is "Passport to World Band Radio", which is
also available from Universal, Gilfer, and other radio supply houses. If you
ask my opinion, the WRTH is *MUCH* more useful and valuable than "PWBR", but
some would disagree. It reails for about $14.95.

> 73's de WB9MVP/6

Tim, I don't believe you meant this literally. The only time SWR
causes power to be lost is when you are using a lossy transmission
line, like coax (types like RG58 being the worst). With a lossy line
even a perfect match at the antenna will cause power to be lost;
thats what a lossy line *is*. In this case, SWR only makes it worse.
Also, with a lossy line and 2:1 SWR, maybe you lose 10%, maybe you
don't: it depends on the type of line and its length.

Of course, there is no such thing as a completely lossless transmission
line, but the closest thing is open wire feeders. If you use them,
then it does not matter at all what the feedpoint mismatch is: all
the power will be radiated. You only need a tuner to keep the rig
happy.

> I sent Frank a nice letter with a SASE asking the name of the operator,
> but of course he never bothered to reply.

Although Frank's station makes a lot of QSOs, I believe he should lighten up and realize that QSLing is very important to many people, even if it's not so important to him.

> Wish we could start a movement where the big contesters that do reply to
> QSL get there logs rejected and can not submit until the past due QSL's
> are mailed.

On the other hand, I'm not sure how QSLing is germane to contest operating ethics. Did Frank ever promise you a card? Why do you think that you deserve a reply? Can your use of US mail to pester Frank for a card be considered harassment?

> Or maybe a column in QST where you can send in the list of stations
> that refuse to reply to SASE's so everyone can find out who does not
> reply so you wont bother working them. Sort'a like a DX manager's list,
> but for the stations that don't QSL.

I think these suggestions are more realistic. I would rather not see valuable inches of QST wasted on this, but it might be interesting to see someone like W6GO occasionally publish a "QSLing Hall of Shame."

One fact that has been overlooked in this discussion is that QSLing is a *courtesy*. If Frank refuses to honor the tradition of courtesy that QSLing had enjoyed through the years, then I (personally) am able to consider Frank nothing less than discourteous. If you want to "get back at Frank" and his success in contesting because he didn't send you a card, then I suggest that you never call Frank ever again in another contest. Furthermore, I suggest you contact his competitors, giving them a few extra points. Eventually, those handful of QSOs he loses because his philosophy about sending cards will cost him the difference between first and second place (or 10th and 11th -- a slot in the Top Ten, hee hee). When this happens, you will can have a good laugh. After all, there are plenty of other hams in Maryland who are happy to send QSLs.

In article <1260002@hpmwtlb.HP.COM> timb@hpmwtd.HP.COM (Tim Bagwell) writes:
}It is not necessary to have a resonant antenna to efficiently radiate energy.

True

}If an antenna is matched to the source, regardless of how it is matched,
}all the energy sent down the transmission line is radiated (neglecting,
}of course, losses in the line , tuner, traps, etc.).

The same is true in an unmatched condition, the only difference is in line loss.

}You need to define what you mean by radiation efficiency. The fact is that
}the radiation pattern will be different for a non-resonant antenna than for
}a resonant one. But this may be desirable in certain situations.

The normal "model" uses a concept called radiation resistance, that is the equivalent "load" presented by the radiated energy. The ratio of radiation resistance to other resitsive losses such as the ohmic resistance of the antenna and anything else which is electrically coupled to the antenna such as the ground determines the efficiency of the antenna. Very few amateur installations get over 50% efficiency BTW.

}If your antenna SWR is 2:1, your losing about 10% of the transmitted power back
}to the transmitter load! This is power that is not radiated anywhere. Contrast
}this to a non-resonant but matched antenna which will radiate 100% of the
}transmitted power (again neglecting losses), albeit, into some different
}pattern. If the antenna length is only slighty off resonance, the pattern
}will not be affected significantly.

NOT TRUE! SWR losses are dependant on the line loss, they are IN ADDITION to the "matched" loss. If the "matched" loss is under 1db (RG213 at <30Mhz for example) then 2:1 or 3:1 SWR will add less than 1db additional loss. See the ARRL Antenna Book for a very complete treatement of this including charts. This becomes significant at VHF/UHF frequencies or when using smaller coax such as RG58/59.

If you run high power (say over 100 watts at HF or 25 watts at UHF) then the power rating of the cable becomes significant. RG213 is rated at approximately 2Kw RF at 30Mhz with 1:1 SWR, with 2:1 SWR the peak voltages and currents are twice their 1:1 values so the line can handle only 1Kw RF EVEN THOUGH the losses are not increased this much. It is possible to melt coax with enough power and it melts at the current nodes, I have seen this with 500W into RG58 coax on 2M. The cable actually melted every 38 inches (1/2 wavelength)!

}Even if you tune the antenna exactly to resonance, it is unlikely that it will
}be matched to the transmission line over any practical bandwidth.

An "exact" match is only possible at one EXACT frequency. As much as 1Hz deviation will introduce a reactive component, but you won't be able to measure it. What is much more useful is the ACCEPTABLE match, normally under 2:1 at HF but some Transmitters require under 1.5:1 for full power.

}This again
}introduces SWR and a reduction in maximum radiated power.

True, but probably not significant. It is quite possible to design antennas with ACCEPTABLE matches over each amateur band. A "cage dipole" on 3.5Mhz for example imitates a 3ft diameter element and will have less than 2:1 SWR from 3.5 to 4 Mhz when properly tuned.

}So I say use a good quality antenna tuner with parallel wire transmission line
}and don't worry too much about resonating the antenna length.

Workable iff (if and only if) you can use open wire line properly (min 12 inches from ANY metal the entire length), and want to fiddle with an antenna tuner.

Generally bandwidth is not a problem for a dipole build from reasonable size wire (no 12 or no 14) except on 80M. There a cage dipole is needed.

Before you start getting too worried about SWR and antenna tuners you need to do two things (from the ARRL Antenna Book BTW), (1) ALWAYS measure antenna parameters AT THE ANTENNA! and (2) use a noise bridge that tells you reactive (L/C) component as well as resictive (R). Trying to do any serious antenna tuning with just an SWR bridge is an excersize in futility, you just don't have enough information.

THe "in line" SWR meter has really two uses: check to see that nothing has come loose and as a quick check of actual line loss. If you check the SWR with NOTHING connected at the antenna end (try both open and shorted) then a 1:1 match means ALL the power is being lost in the cable - replace the cable! I think the ARRL Handbook has a chart relating SWR to actual line loss using this method, from memory 3:1 means 1/2 the energy is being lost, and infinite SWR means no loss (and of course never happens).

Oh yes DON'T use "RG8" coax unless it is a "name" brand such as Belden, the designation is meaningless any more and there is a LOT of "junk coax" out there. If you are buying new then by RG213 or similar which IS MIL Spec. Try out some of the "cheap" cable with the SWR checking method and you will soon see why you need the better stuff.

Especially at HF, "if it conducts it will radiate" the rest is optimization!

Finally - the ARRL Antenna Book is a gold mine of good information, if you don't have it then you need it!

Generally, you hook the MUTE and the TS440 PTT line to the TNC's PTT
line. Then when the TNC pulls down PTT it pulls MUTE too. If you want
to leave the TNC hooked up all the time, you need to put a couple of
small signal diodes in the MUTE and PTT lines so when you key the mike
from the front of the set (for normal SSB operation, say) the PTT signal
which gets propagated out the ACC jack doesn't pull the MUTE low. It
HAS happened....

Hello All,

I recently bought a mint condition Icom IC-740 along with a Ten-Tech 229 200w/2kw antenna tuner from a friend. The 740 had the IC-PS740 builtin power supply, the IC-EX242 FM option, the IC-EX243 electronic keyer, and the FL-52 455kHz CW/RTTY filter installed.

I am interested in trying to locate some of the other options such as the FL-44 455 kHz SSB filter, the FL-45 9.0115 mHz CW/RTTY filter, and the IC-EX241 marker unit. Also, the manual mentions using a transverter for VHF/UHF when the FM unit has been installed. In particular, I would like to know what transverter (ICOM #?) could be used with it and if they mean theirs or some third party transverter in general, and if it is some third party unit, whos would work and where could one be gotten? Of the filters mentioned above, I am particularly interested in the FL-44 SSB filter.

Also, the unit has receive only on 17 and 12 meters, but being a micro-processor controlled type radio, and that it has specific coverage of those bands, I sort of figured that there was probably some sort if transmit inhibit diode or something. Can anyone elaborate on this? Has anyone succeeded in enabling transmit on these bands?

Any information on anything above would be greatly appreciated. As I said the unit is in mint condition and as a new licensee, I am eager to gather as much information on it as possible. Any hints and tips from other 740 owner would be highly valued too! I noticed that the 740 was replaced by the 745 only a year or two after it was introduced (in the December 1982 ICOM catalog I think). My guess is that with the new bands, and desires for general coverage, and improvements in computer controls and memories, the 745 was quickly needed. Does anyone know of any other reasons that brought this about?

Please email responses. Thanks in advance!

Mark.

In article <854@anasaz.UUCP> john@anasaz.UUCP (John Moore) writes:
>LaGuardia is the only airport in the US that has ever given me any
>hassle (other than maybe asking me to demonstrate that the radio
>works). They REFUSED to let me take it through security, and said
>I had to check it as baggage. Only the intervention of the ticket
>agent for my airline (he "vouched" for me even though he had never
>seen me before!) get it through. What a bunch of jerks!

For me, it was Newark. The radio, my FCC Amateur License,
my FAA Pilot Certificate, my FAA First Class Medical and my
driver license were presented by the airline agent, at the insistance
of the security people, to the captain. One quick look and
he handed everything to me and explained that the security people
were poorly trained and had high turnover. We then sat in the
terminal building for five hours while he refused to fly 4 different
aircraft.

I did talk to someone at the Eastern Regional FAA office,
who could not exactly answer my questions, and was unable to
tell me where in the REGS it stated that radio equipment was
restricted from carry-on status.

I have a friend who regularily carries handhelds and other electronics
on both domestic and international flights. He hasn't had any
problems...but he has described the radio as commercial equipment, and
presented his business card (radio salesman).

3848. Re: Kenwood RZ-1 Wide Band Receiver

Newsgroup: rec.ham-radio
Date: 1989-11-07 20:30:29 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <8911080819.AA09134@ucbvax.Berkeley.EDU>
Source record: 15679

This was reviewed by Radio Nederland's Media Network people some months back, soon after it came out, and the general impression was that the RZ-1 was a real loser. I think Larry Magne reviewed it on Radio Canada International's SWL Digest program too, and came to largely the same conclusion.

As I recall, the shortwave performance was really poor. It didn't fare too well in the VHF/UHF range either. If I dig up anything written about this, I will post more detail. As an interim summary, though, I think it is safe to describe it as "overpriced junk".

3849. Re: ALUMINIUM TOWERS-CRACKS

Newsgroup: rec.ham-radio
Date: 1989-11-07 20:42:42 UTC
From: rkarlqu@hpscdc.scd.hp.com
Message-ID: <5490070@hpscdc.scd.hp.com>
Source record: 15686

I remember reading an article talking about masts to mount
beams to a tower. It said that you could design an aluminum
mast that, according to theoretical calculations, was stronger
and lighter than an equivalent steel mast (although perhaps
thicker walled). But then it went on to say that the
aluminum mast will work fine for a while until it
becomes brittle and suddenly "crystalizes." At that point
your christmas tree comes down. The article strongly
recommended *against* aluminum for structural members,
if steel could be used instead. Perhaps this is also
a bad omen for aluminum towers.

3850. Re: QSLs and SASEs

Newsgroup: rec.ham-radio
Date: 1989-11-07 20:44:42 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <8911080821.AA09182@ucbvax.Berkeley.EDU>
Source record: 15683

If a "fill-in-the-blanks" generic QSL card is good enough for whatever purposes you want the card for, why not just fill in the blanks yourself and make up your own card if the other guy is too picayune to respond to your request, after you've tried once with a SASE?

Will

3851. W3LPL Operator Fights Back

Newsgroup: rec.ham-radio
Date: 1989-11-07 20:48:14 UTC
From: pescatore_jt%ncsd@gte.COM
Message-ID: <8911072048.AA25806@bunny.gte.com>
Source record: 15684

From the continuing saga of QSLs:

Hollenack says:
> Or maybe a column in QST where you can send in the list of stations
> that refuse to reply to SASE's so everyone can find out who does not
> reply so you wont bother working them. Sort'a like a DX manager's list,
> but for the stations that don't QSL.

Trey says:

I think these suggestions are more realistic. I would rather not see
valuable inches of QST wasted on this, but it might be interesting to
see someone like W6GO occasionally publish a "QSLing Hall of Shame."

One fact that has been overlooked in this discussion is that QSLing is
a *courtesy*. If Frank refuses to honor the tradition of courtesy that
QSLing had enjoyed through the years, then I (personally) am able to
consider Frank nothing less than discourteous. If you want to "get back
at Frank" and his success in contesting because he didn't send you a card,
then I suggest that you never call Frank ever again in another contest.
Furthermore, I suggest you contact his competitors, giving them a few extra
points. Eventually, those handful of QSOs he loses because his philosophy
about sending cards will cost him the difference between first and second
place (or 10th and 11th -- a slot in the Top Ten, hee hee). When this
happens, you will can have a good laugh. After all, there are plenty of
other hams in Maryland who are happy to send QSLs.

John WB2EKK says:

As a frequent operator at W3LPL (40 CW/20 SSB, usually) I feel compelled
to respond to this latest raging debate. To me QSLing is much like giving
out candy at Halloween. If you have kids, you tend to give out candy. If
you like giving out candy, you give out candy. If you don't want your windows
soaped, or your tree TPed, you give out candy.

Many who don't chase QSLs don't send QSLs. Many years I go out to a bar
to avoid trick or treaters. I don't always fill out questionaires when they
come in the mail, even if they give me a stamp, or a little pencil (what
do they think we would want those little pencils for, anyway?). If I received
2000 questionaires a year, I might not respond to any, either.

The equivalent of soaping a contester's windows is to not work him in a
contest, as Trey suggests. I have been severely berated for not QSLing by YUs
on 20 when operating at LPL, and my rate suffers for it. As a 100 per cent
return QSLer, I think we would see a slight increase in score by QSLing. To be
arrogant, we are whipping the competition by such wide margins that it would
not mean a bit of difference in the final standings (let alone are we worried

about the difference between 10th and 11th place). But I agree with the main point: if K7SS or KQ2M or WN4KKN at N5AU won't send you a QSL, don't work 'em. But lets not waste column space or energy on "QSLer Halls of Shame". Those actually cause competition to be the most shamed.

For all contests where the W3LPL station is operated by a single operator, by the way, the contest results will list the operator. On 160M and 10M contests in particular, and SSB SS, the guys who usually operate there will be glad to QSL. Just look in the results, find the operators name, and send the card direct.

For you DX stations who work the W3LPL multi-multi, there's hope yet, by the way. For the recent CQ WW SSB, all bands except 80 and 160 used K1EA computer logging software, and 80 and 160 are being merged in by hand. If we can talk Frank into paying for 20,000 or so cards, and volunteer to put labels on, we may bulk QSL soon.

Message-ID: <5490071@hpscdc.scd.hp.com>
Source record: 15687

Order your filter as a replacement part for a tranceiver. Most all of the commonly available HF transceivers have a 40 to 70 MHz. "roofing" filter for the first IF, which is usually 20 kHz. wide.

Also, TOKO (Mt. Prospect, Ill.) just announced an 82 MHz. SAW filter for cellular radio first IF's. You should be able to buy small quantities of them.

3854. Re: Looking for amplifier, Really All India Radio

Newsgroup: rec.ham-radio
Date: 1989-11-07 21:15:38 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <8911080822.AA09293@ucbvax.Berkeley.EDU>
Source record: 15680

I'm sorry to say that it is just about impossible to get good, listenable reception from AIR here in the US. I have been trying for years, and get only marginally-intelligible signals at the best of times, even with an outdoor longwire antenna. What All India Radio needs to do is to work out a transmitter-time swap with one of the big religious broadcasters. The Voice of Free China, in Taiwan, did this with WYFR, and thereby became an easily-received and popular shortwave broadcaster, instead of being barely receivable.

There are enough Indian nationals (and people like myself who are interested in Indian music and culture) in North America that AIR would have an immediate and sizable audience if they would take this step. It could be done with very little expense -- certainly far cheaper than installing new high-power transmitters and trying to reach this continent directly!

To any Indian nationals reading this -- if you or your families have any influence at all in the Indian government or can reach officials of AIR, *please* push this idea.

Regards, Will Martin

Here's some comments on the RZ-1 that I found I still had on-line:

Date: 28 Dec 88 12:49:47 GMT
From: att!ihuxz!parnass@ucbvax.Berkeley.EDU (Bob Parnass, AJ9S)
Subject: Kenwood RZ-1 [Wow!, or Bow-Wow?]

In article <1495@umbc3.UMD.EDU>, battle@umbc3.UMD.EDU (Mr. Rick Battle) writes:
> I was in my local ham radio store (Maryland Radio Center)
> when I saw the Kenwood RZ-1 for the first time....
> Any comments on the radio or my reactions.

Larry Wiland published an unflattering review of the RZ-1 on
page 90 of 1/89 "Monitoring Times." Larry probably saved his
readers (potential buyers) a lot of money.
--
~~~~~~
Bob Parnass AJ9S, AT&T Bell Laboratories - att!ihuxz!parnass - (312)979-5414

Date: 28 Dec 88 21:42:40 GMT
From: hpda!hpcupt1!bmp@ucbvax.Berkeley.EDU (Brian M. Perkin)
Subject: Kenwood RZ-1

There is an article about the RZ-1 in Jan 89 Monitoring Times.
When I first saw the unit I was ecstatic because I thought
I had finally found a unit that was a full coverage SW radio
and scanner and would have the best features from both worlds.
I was all set to sell my pro-2004 and buy a RZ-1.
~~~~~~

The more I researched it, the less I liked it.
The RZ-1 scans slowly,
doesn't have SSB capabilities and is hard to program.

Monitoring times suggests waiting for the RZ-2 or the RZ-3 where the "bugs" will be worked out. I tend to agree with them. However if I had a DIN size car radio in my car, I could be tempted to replace it with the RZ-1.

>letting you borrow a part of HIS cave.
>...take the toys away from BOTH of you, so NOBODY wins.

It seems that thats the way the FCC appears to think of it too, at times.

>Clay Jackson
>(Reaching for nomex longjohns)

I hope you won't need them...

In any case, my questions are - what can we do about it now?

and, How can we avoid getting the FCC awake next time?

(OR at least how can we keep from getting the FCC wide awake.
It sounds to me like *some* of the activity on the nets *might*
(PLEASE note the highly qualified nature of this statement!) be
illegal. It also seems to me that, regardless of the legality
of the patches/3rd party traffic, the responses of the hams who
jammed were also illegal. In any case, it would be nice if we
had a place to turn with authority somewhere between the FCc and
individual hams. Something like binding arbitration? I dunno, just
thinking out loud - a dangerous activity on the net, for sure!
Anyway, my question is - how to solve problems like this one
without getting the FCC quite so involved? Ideas?)

Enough raving for now, time for the nomex longies.... :-)

From: 702WFG@SCRVMSYS.BITNET
Message-ID: <8911090804.AA03598@ucbvax.Berkeley.EDU>
Source record: 15677

I have two requests today. One directly related to ham radio and the other only of minor interest but I'm sure someone here can help me.

#1: Is there anywhere online that the VEC question pool is kept? My daughter is going to have her NOVICE real soon now and I would like her to go straight ahed for at least a TECH but hopefully her GENERAL. And being as I am spending a lot of time working with the code to get her thru this I am even considering going after my EXTRA just for the fun of it.

#2: Can anyone point me to any articles online or not that discuss the effects of extremely strong magnetic fields on the human body?? I know research has been done recently and although I didn't pay a lot of attention to it before (I don't live near any big power lines) I have been asked about it recently because of a situation here at work. Apparently they rea arranged some offices and now we have a person sitting on the opposite side of a wall from an ~25KVA transformer. The immediate effects are that her PC monitor is trashed by the magnetic field and when ever she sits at here desk the amount of static electricity in the air makes her hair stand up (like the old experiment with the VanDeGraff generator). I think a field that strong warrants some investigation. A call to NIOSH didn't reveal any concrete information other than their oppinion that the transformer should not be located inside the building.

Any help will be, as always, greatly appreciated.

The satellite is probably not Polar Bear. Polar Bear (for Polar Beacon Experiment and Auroral Research) is a modified U.S. Navy Navigation Satellite System (Transit) satellite that hung in the Smithsonian Air and Space Museum for about 8 years (I have a slide I took to prove it) before being refurbished for launch. The transmitting frequencies are believed to be about the same as those used by the Transit system plus an L-band channel. Frequencies are probably 149.981, 399.962, and around 1575 MHz.

I believe that both the Kettering Group and the Dallas Remote Imaging Group are trying to determine which satellite is actually transmitting on 432.875 MHz.

>whether Kenwood has a follow-on product planned?

I was seriously going to buy one several months back. So serious in fact that I drove over to Kenwood (only about a 10 minute drive) and I bought the RZ-1 service manual.

Well me and my friends just critiqued the thing to death. Everything above 30 Mhz is handled by a modified cable TV front end. Yep, just one of them varactor tuners! There are about 4-5 separate front ends for the shortwave stuff. Again, not a very impressive design.

Don't think about modifying it unless you like toying with surface-mount parts. Also someone else who did buy one said the front panel bulbs burned out in about a month. Very hard to get to and replace.

If you want more technical stuff, let me know. I've got a $10 manual for a radio I'll never buy.

I bought a brand-new HF6V a year ago. I couldn't find a place to
run decent radials and then got a Cushcraft R4. I still have most
of the pieces to the butternut. The coax i found in the box was
a generic RG-59 hunk that was 62 inches long. If I can find the
original instruction sheet in my vertical piling system I will
verify whether is was to be trimmed down or not. Hope this helps.

3868. Have the name - need the call!!

Newsgroup: rec.ham-radio
Date: 1989-11-08 16:03:04 UTC
From: chuck@ncrcce.StPaul.NCR.COM
Message-ID: <1696@ncrcce.StPaul.NCR.COM>
Source record: 15694
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Question:

Is there a way to find out somebody's call sign if you know their name?

I don't know if Buckmasters (tm) can do it, and even if they could, I don't need the service bad enough to spend the Bucks they want. There must be a database somewhere else that hams can access and do searches on. I see people looking for lost ham buddies all the time. In my case, it is a lost relative.

It would even be nicer to find out all the hams in a given area or to find the call of a ham at a given address. The call book is fine for finding the information if you know the call.

I wonder if the FCC has a complete set of files they sell. Maybe there's a need here that can be filled by a cheap "inexpensive" service.
Anybody want to go into business? :-) Maybe the packet networks could have this service incorporated into it.

Thanks,

3869. are QSL cards really necessary for awards?

Newsgroup: rec.ham-radio
Date: 1989-11-08 16:50:49 UTC
From: kawai@csli.Stanford.EDU
Message-ID: <10967@csli.Stanford.EDU>
Source record: 15693

Will writes:

> If a "fill-in-the-blanks" generic QSL card is good enough for whatever
> purposes you want the card for, why not just fill in the blanks yourself and
> make up your own card if the other guy is too picayune to respond to your
> request, after you've tried once with a SASE?

Now here's something to think about. This is the way I feel:

* I'm not sure whether sending and receiving QSL cards is an inseperable act
from the actual contact itself. There are other ways to confirm a contact
asides from receiving a QSL card.
* I don't want to forge contacts.
* If getting a QSL card is too much of a hassle, then I might as well forget
the award, and work somebody instead.

Say, for example, you tape-record all your contacts. Then, by
listening to your tape-recordings, anybody can verify you have indeed
worked the stations you have claimed to have worked. There would be
no need for obtaining QSL cards.

Likewise, an honest person can simply enter the contact in his logbook.
Awards bring nothing but personal satisfaction to begin with, so there
is little reason to cheat. I wish awards were given out using the honor
system. Brings back some humbleness into the hobby, doesn't it?

Many award issuing organizations require possesion of QSL cards. I
interpret this as a requirement for objective proof of the contact.
It so happens it is the least bothersome to validate from the award
issuing organization's point of view. Unfortunately, getting the QSL
cards seems to be as difficult as getting the contact itself. It
appears that the integrity of the award is being maintained at the
expense of time and effort of its applicants.

If an award is given to people who are not only capable of working a
set of stations, but also managing to obtain QSL cards from them,
that's fine. But such requirements should be explicitly stated in the
award requirements. Most awards state that they require proof of the
contact in the form of QSL cards. The first half of this proof
requirement is fine; the second half is debateable, because it means
that the applicant is measured by a scale that is not deeply connected
with the actual contact itself, but by a scale that measures an action
that is separate from the contact. In other words, you find that to
qualify for an award that is given to people who work, say, a hundred
DXCC countries, you not only need to work them, but you need to get
QSL cards back, which means that that award is actually given to

people who know both how to work people on the air and through the mail.

I love sending and receiving QSL cards - my room is plastered with them - but feel it's a hassle securing QSL cards to qualify for a reward after you've worked them. If DXCC plaques are given out only to those who work people once on the air and once on the ground, then so be it. Unfortunately, this diminishes my enthusiasm for DXCC awards somewhat. I can still work countries, and say that although I haven't got a card from many of them, I have worked over a hundred. This is what I have been doing, and I suspect there are a lot of covert DXers like me - quite possibly much more than those who actually claim awards.

Bottom line is this: if awards require QSL cards, I will not forge cards to get that award, but I may not try very hard to get QSL cards back, either. I hate forgeries and can't spend extra time and money on what I view as an optional task.

(In fact, since QSL cards cost so much and major awards signify substantial investment on part of the receipient, they should do away with QSL requirements, and ask for an application fee that would be used to support QSL bureaus in DX countries, so that everybody can start getting cards if they want to! Kidding here...)

Airplane phones are not cellular phones. They couldn't use the cell approach for the same reasons air-mobile hams have to watch out when using repeaters. More to the point of the interference with avionics issue: as I understand it the rules allow for any electronics that have been certified for the aircraft. That obviously applies to the airplane phones -- but not to cellular phones.

Re aluminum suddenly "crystallizing" and turning brittle: as a blanket statement that is obvious nonsense. If it were true, airplanes would not be made of aluminum!

It IS true that metals in general are subject to "fatigue" failure. As I've seen it explained, each metal has its own characteristic relation between number of times it is flexed and the permissible load. Supposedly aluminum is more tricky than steel in that respect: the permissible load for steel becomes independent of number of flexures sooner than aluminum does, so you need to de-rate the breaking strength of aluminum by a bigger factor than steel. But that's quite a different statement than the bogus assertion that aluminum is by definition unsuitable for structural applications.

Since I'm not a mechanical or structural engineer, I can't give more precise comments. You might want to read the book "Structures -- or why things don't fall down" (don't remember the author's name).

Suppose you had used "some" logging program you really liked, but forgot where you had actually used it and had no link back to find it. Can you describe HOW that program actually works, as opposed to just naming who wrote it. I'm interested in things like:

1. Can I enter things in any order I want, even switching from entry to entry while each is partially done, or am I forced to enter data only in a predetermined invariable order?

2. How easy is it to configure it for a contest that the author did not plan for? Can it be configured to validate a wide variety of different exchanges?

3. Will it look up a call sign in an online database? What format must database be in? How slow is the lookup? Can I enter another QSO WHILE the previous one is concurrently being searched in the database? Do I have to buy a database package to do this?

4. What statistics/needs does the program display? Do I have to ask for them each time, or can they be displayed continuously while entering new QSO data?

5. Does it support larger screen data sizes of EGA and VGA displays, e.g. 43, 50, or 60 rows?

6. Can it continuously write a backup stream over a port to another machine? Would it use TCP/IP if the package was resident?

I personally will not buy a logging program when I an perfectly capable of writing my own. The disadvantage is that I won't get to see what others consider to be useful user interfaces. I have seen some before, but they are all different and I am not convinced there is any standard yet; I have not seen one anyway.

In article <10967@csli.Stanford.EDU>, kawai@csli.Stanford.EDU (Goh Kawai) writes...
>Say, for example, you tape-record all your contacts. Then, by
>listening to your tape-recordings, anybody can verify you have indeed
>worked the stations you have claimed to have worked. There would be
>no need for obtaining QSL cards.

If nobody ever pretended to be a station they weren't then that might be
true. But there is no way to verify the station you hear on the tape is
indeed the station it claims to be. The thought is that by contacting
that station by mail and having the operator send a written confirmation,
you can reasonably verify the contact. (There are scenarios where
fraudulent contacts can still be perpetrated, but they start getting out
toward the end of the bell curve. I think a QSL card gives greater than
95% confidence that the contact was genuine.)

In re some other message:

Making out your own QSL cards and trying to pass them off for awards
seems to be in the gray area between ethical and unethical. Certainly
if I found a lot of fill-in-the-blanks QSLs in the same handwriting, I
would put the entire stack under extreme scrutiny. And maybe if I found
even one or two from stations that I knew don't QSL "nohow, noway" it
would be likely to turn ugly. In a hobby that communicates around the
world, do you want your name associated with something that is not on
the up-and-up?

You can carry it on all you want; you just can't use it in flight
without explicit prior permission from the airline, _NOT_ the captain.

The last time this came up, I posted the relevant parts of 14 CFR 91,
which are general flight regulations applying to all flights inside the
US or on US-registered aircraft.

Does anyone out there in net-land have any experience with Missouri Radio Center? So far they've given me the lowest quote on an Icom IC-U16 handheld (commercial UHF - I'm in the public safety business) at $499, whereas most other places (Ham Radio Outlet, Amateur Electronic Supply, etc) have quoted about $599 for the same radio. It seems strange that one place has it $100 lower than anywhere else, hence my post.

Thanks in Advance,
Greg

I have an ICOM-228A and need mic connectors.

I want to wire up an extension cable to connect a Yaesu auto-dialer mike to the 228. In order to do that, I need an inline mic plug and jack. I have found the female jack at Radio Shack, but they don't carry the mating plug (inline or panel mount). C W Electronics in Denver doesn't either. (jack == female, plug == male, jack is on mic cord, plug is a panel mount on the 228.)

Does anyone know what I'm talking about and know where I can get the correct 8 pin plug?

IMMEDIATE RELEASE

TO: ALL@ALLBBS
FROM:N2DSY@KD6TH
BID: $0811_ROSES
SUBJECT: ROSES-1 Event Schedule

11 November 1989

ROSES-1 Schedule of Events

As of 28 October 1989

The New Jersey Institute of Technology Amateur Radio Club and
the Radio Amateur Telecommunications Society are co-sponsoring
the first RATS Opens Systems Environment Symposium (ROSES-1).
ROSES-1 will be held on the 11th of November 1989 in the Student
Center of the New Jersey Institute of Technology from 8AM to
6PM. Talk-in will be on 145.19 (-600) and 147.225 (+600) MHz.
For further information contact Gordon Beattie, N2DSY at
201-387-8896 or via packet n2dsy@kd6th.

This event will include talks for the new and experienced operator.
All software discussed at the sessions will be available for free.
(plus cost of media - so bring 5-1/4 or 3-1/2 inch disks)

Also: Question and Answer Sessions,
Demonstrations,
TNC Tune-up (bring TNC and radio)
Equipment Literature,
Software Distribution,
License Examinations.

NOTE: ALL Sessions include a Question and Answer period.

Plan on dinner with your fellow operators!

For further information contact:

General: Gordon Beattie, N2DSY 201-387-8896 n2dsy@kd6th
Testing: Pete Adley, K2MHP 201-796-6622

The tentative schedule follows:

Activity 1 Activity 2

08:00 Coffee, Tea, License Exams
Doughnuts Start
*
09:00 Introductions, *
Announcements *
*
09:15 How to Set Up a *
Packet Station *
*
10:00 Operating a Personal *
Mailbox *
*
11:00 Networking with the End
ROSE X.25 Switch

12:00 Frequency Coordination
Forum

12:30 Announcements

<------------- Lunch ------------->
Available in Cafeteria

13:00 ROSErver/Packet Packet for the Blind
Radio Mailbox Voice Synthesizer Demo
System User Forum *

14:00 Open Systems Mail, ROSErver/PRMBS Demonstration
Directory and *
Network Management *
Forum *

15:00 Break, ROSE X.25 Switch Demonstration
Announcements *
*
15:15 Broadcast File *
Distribution *
and Roundtables *
via Packet *

16:00 User Forum ROSErver and ROSE X.25 Switch
Open Q&A Switch Sysops Meeting
for All! All Welcome!
*
16:30 Informal Discussions, *
Demos Before *
Dinner at the Diner *

Let us know if you're planning to attend by sending a packet message to
N2DSY@KD6TH.

73, and see you at ROSES-1 !

No, it boils down to a technology difference.

Cellphone base stations are really close together in airplane terms. The
inflight telephones use similar technology but on different frequencies
and with the cells much, much farther apart. They do not interoperate.

- - The original note follows - -

I might be the only one that didn't know about it, but in the off chance t
hat someone else didn't know, here goes:

I caught a ham radio show on 'The Voice of the Andes' which was kind of interes
ting. I am not sure if it is nightly or weekly yet, but here's the info:

Thursday 11/9 0200Z-0230Z (Wednesday in USA)
HCJB
Voice of the Andes
Seto, Ecuador
South America

9745khz, 11775khz, 15155khz

15155khz came in full scale, while 9745 was a bit lower in strength.

The show this time read letters from around the world, and discussed the no-cod
e license idea.

Two techniques I've come across - one directly, one by repute: -

(a) a ZL replied to a bureau card by returning my card but with a rubber stamp on the back saying "verified". I wasn't thrilled about this and I doubt that the DXCC guys would accept that! But I'm not short of ZL cards, and whenever I send a card via the bureau it's with the expectation that I'll get no reply, so I can only be pleasantly surprised.

(b) I'm told that the DXCC guys received an application for DXCC, and had an uneasy feeling about the 100 or so cards submitted. Then they realized that they were all the same size, and had only a few different print types represented on them. The applicant had printed them all himself - who said the art of home-brewing is lost?

From: caf@omen.UUCP
Message-ID: <865@omen.UUCP>
Source record: 15718

Another reason for the lower IF frequency in car radios was that they use to be permeability tuned (variable inductors instead of variable caps) and tracking was easier with the lower IF. This was long before transistors made it to car radios.

You could rewire a tube car radio into a 6 meter transceiver without too much trouble.

3896. starter shortwave radios ...

Newsgroup: rec.ham-radio
Date: 1989-11-09 09:35:43 UTC
From: muller@sdcc10.ucsd.edu
Message-ID: <4959@sdcc6.ucsd.edu>
Source record: 15719

There are two types of markets:
1) DX radios for grabbing those "down in the mud" signals
2) Hi-fi radios for quality audio

Obviously it is hard for a radio to do both well. Lower cost radios
do either 1 or 2 well but not both (usually). Higher cost radios add
electronics to improve either 1 and/or 2, but even then doing both
is hard.

For example take the Sony 2020 (aka 2001D outside of the USA). It is great
DX radio for it's price, but it audio quality is far from Hi-Fi even
on the best of signals. The Grundig 650 is great for Hi-FI, but it is
not in the same class as the Sony 2010 for weak signals.

For a first time radio one nice choice is the Sangean ATS-803A (aka radio shack
DX-440, eska RX 33). It is not the DX performer the sony is but is close.
It has much better audio. (The FM stereo output is pretty good). And it
costs a lot less ($180 USA versus $350+ USA).

If cost is no object then the Grundig 650 for Hi-FI on strong signals. The
kenwood R-5000, JRC NRD-525 or the Icom R9000 are good at DX (and good
audio on the R-5000). The R9000 is looks awesome in the ad's, though I
have never seen one in person. The icom R-71a used to be good, but
the newer serial numbers in the USA show several problems. JRC radios
are built like battleships, though the performance is not up to same
level as similar priced radios in some respects.

For used radios. Drake R-7 and similar models should be kicking around.
Drake made some really good radios even at todays standards. I have no idea
what they go for now.

My favorite of the group is the Kenwood R-5000. It has the DX performance
and I can listen to music on it for hours. Listing to a strong music
station on the Sony 2010 is hard on the ears.

I have just seen an ad from Telex about a product called Ear-Mike.
It is a speaker/mike built into an ear peace that is connected through
an adapter to your radio. It is reported to be good in high noise areas.
Has anyone seen one of these? What is the sound quality like (talking through
my ears - seems like it should sound different)?

Chris Allison N8DSC

3898. Headsets and VOX.

Newsgroup: rec.ham-radio
Date: 1989-11-09 11:12:23 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <09.Nov.89.11
Source record: 15715

I have an 'AIRLITE 62' headset with built-in noise-cancelling boom mic.
(dynamic type). I have found that this headset is one of the most comfortable
for long periods of wear (8 to 10 hours at a stretch). It has very good
sealing round the ears to keep out extraneous noise, and removable cotton
covers over the ear-pads and head-band.
'Airlite 62' headsets are used by the majority of British airlines for
their pilots/copilots. I beleive they were also used on Concorde at
one time. Mine cost 35 pounds sterling, new.
I use the thing without VOX, i have a small diecast box fitted in the
lead, with a 3-position biased switch, so its possible to flick to
'TX' against the spring bias for short overs, or put it the other way
(latching TX) for longer overs.
This avoids the problem of someone creeping up behind you & tapping you
on the shoulder (because the external noise sealing of the headset is so good,
and theyve shouted at you 3 or 4 times without you hearing) and they then
startle you, and the sounds of you having a coronary are then broadcast to
the world coz the VOX has gone 'on'.............!
I used to use VOX with *VERY* short timer (20mS hang time) and with good
net discipline, its almost like full-duplex. It would drop the
transmitter between words. Long enough for someone to shout 'Priority'
or 'safety' and take control of the net. Sort-of like the audio equivalent
of full-break-in on CW. (It does tend to rapidly destroy the TX/RX
changeover relays though :-).) I also used to use a 'fast' repeater
along the same lines - no courtesy tones, voice idents, bleeps or
other 'noises off'. We needed PL-tone (or as we call it here, CTCSS)
for this though.

>You can carry it on all you want; you just can't use it in flight
>without explicit prior permission from the airline, _NOT_ the captain.

This is a sticky point. If the airline gives you permission, the captain
can still stop you. The captain has ABSOLUTE authority while in
command. (It used to be that the captain even had control over the
FAA in an emergency. I presume that is still true.)

If the airline DOESN"t give you permission (they say NO!), then the
pilot is going against company regs/policy if he does give you
permission.

(One Christmas, I was given a CHEAP, CHEAP aircraft radio receiver
(for picking up the proper aircraft frequencies). On my flight home,
I explained to the captain that I was a pilot and wanted to monitor
their transmissions from the main cabin. He gave me permission and
gave me the first (ground) frequency to use.

SOmetime later (well into the flight) the captain was making
a routine "If you will look out the left side...." type announcement.
At the end of the announcement, he said "and for Mike back there, if you
have lost us, we are on xxx.xx". I was very impressionable and thought
that was really neat. To this day, that airline is one of two that I
tend to use.)

>Making out your own QSL cards and trying to pass them off for awards
>seems to be in the gray area between ethical and unethical. Certainly

Perhaps a slight change to QSL design might help. Currently a lot of
QSL cards have "PSE ___ TX ___ QSL" on them where one can check
the appropriate place. Maybe it could be changed to
"PSE ___ TX ___ CONF ___ QSL". It would work like this. I would
fill in the card for the other station and mail it to him/her. It would
already be posted back to me. All the other station has to do is initial
and send back (presumably after checking the log). I would have the QSL,
he/she has confirmed it and now it is legit.

This will break down somewhat for DX since you couldn't put stamps on but
might still improve QSL probability somewhat.

(THis is just a suggestion and I don't know if it would work. I don't send
QSL (even though I am a sorter) since my radio is "mothballed".)

3902. Old QSL Hints and Kinks

Newsgroup: rec.ham-radio
Date: 1989-11-09 13:25:10 UTC
From: pescatore_jt%ncsd@gte.COM
Message-ID: <8911091325.AA08317@bunny.gte.com>
Source record: 15598

QSL HINTS AND KINKS - WB2EKK

I cut this out of an article I had written for an old novice cookbook we put together in the 70s, and updated it a bit. Its sorta stream of consciousness:

The best way to increase your QSL return rate is to think about those things that prompt you to respond to someone else's QSL card, and to decide how badly you want each individual card. The amount of time and money you spend on QSLing will be directly related to these two factors.

HOW TO FILL OUT THE CARD:

Log the time and date of the contact accurately. Use GMT for the time AND DATE. Write the date 4 Sep 89, not 9/4/89 which means April 9th to many people. Write your numbers legibly.

DOMESTIC QSLs:

If you are a ragchewer and just like to collect cards, slap a 14 cent on 'em and send 'em out. If you really want the card back, put it in an envelope with an SASE enclosed. In the remarks part,
use the other guy's name, make it personal. For domestic QSLing, what YOUR card looks like is important; an attractive or unusual card will increase your return rate.

If you are 18 years old or younger, mention your age in your remarks. In fact, if you are, say 13 or younger, by mentioning your age you can probably get away without an SASE if you write in block scribble.

DX QSLs:

For the garden variety countries (most of Europe, JA, VK/ZL, etc) bundle them up and send them to the ARRL outgoing bureau (look in the How's DX column in QST for info on how to do this). One exception seems to be south America; with the exception of PY and LU, most of the SA countries seem to ignore the bureau.

For the slightly rare countries (like PZ, 5H, 5B4, etc) listen to what the operator says about QSLing (direct, via bureau, or a manager). If its via the buro, do that. If it is direct or via a DX manager, put your card, a self addressed large (more in a bit) envelope, and a dollar bill (euphemistically called green stamps these days) in an envelope
and send it to the DX address. Don't put any callsigns on the envelope and put the dollar bill between the SAE and your card so it doesn't show through the outer envelope. You'll keep the honest Postal workers honest this way.

For the SAE, I've found that using the European size Air Mail envelope greatly increases my returns. Our business size envelope costs more for the DX station to mail, and often gets discarded. Any stationary store will sell you a bunch of these.

What your card looks like matters less for DX QSLing, but a nice card can't hurt. If it is an important card to you, and after three or four months you have not gotten a reply, try again. I usually include another buck, since I assume it was lost in the mail.

For stateside managers, use an SASE like going for a domestic. You can help the manager, and maybe increase your return, by putting your call and the time and date of the contact on the top of the back flap of your SAE/SASE (not the outer mailing envelope). This helps because many managers will get your card before the get the logs from the DX station, and they sort the cards by time and date to await the logs.

For contacts with Russkies, send them all to Box 88. Yes, I know you can send direct these days, but lets not spoil them. It takes a little longer, but it sure is a lot cheaper.

HOW DO I KNOW WHERE TO SEND THE CARD?

Buy the DX callbook. Too cheap? Too bad. Subscribe to the W6GO list, or a DX bulletin. Listen to the DX operator. Check the Packetcluster of your local DX club, most have a QSL manager database these days.

3903. QSL-ing

My $0.02: I don't send cards, unless specifically requested- which isn't too often, as few people have a hard time confirming Michigan for WAS! I never request cards from DX stations, as a lot of them probably make half their contacts with people who just want the card. The operating side of radio is for me a casual, relaxing affair. I get wound up enough at work.

Having said that, I in no way denigrate the "59 Michigan QRZ?" group nor the heavy duty DX-ers; it's just not my vision of radio. I log *all* my contacts, and I like collecting DX stations, but I'd rather have the memory of a long QSO than another postcard. So rog, OM, and by the way, I QSL 10%....

It has been a few weeks now, since I last said anything about my MacIntosh HyperCard Ham Stacks. I've been desperately trying to find the time to upgrade the Novice and Technician Ham Stacks with the latest (newest) questions. Not easy with my full schedule..... But FINALLY, I believe I can see the light at the end of the tunnel. I've completed upgrading the Novice stack, and I am only 7 questions from the end in the Technician stack. Both are now version 2.0.

I have about 6 requests for these stacks sitting on my desk. I apologize for the delay and I will be sending them out shortly (this weekend). The Extra Ham stack is still incomplete, so I won't say anything more about it for now....other than I'm working on it!

For those who are unfamiliar with these stacks, each one is a randomly generated test, from the appropriate question pool. They are extremely helpful in studying for the written tests. They DO require that you have a MacIntosh computer, and that you have the program HyperCard....and HyperCard almost requires a hard disk and at least 1 Megabyte memory. Currently available are the Novice Ham Stack, the Technician Ham Stack, the General Ham Stack and the Advanced Ham Stack. If you have Stuffit, all four will fit on one diskette. Otherwise, please specify which two (or three sometimes) you want. These Stacks are PUBLIC DOMAIN and may not be sold by anyone.

The stacks may be obtained from me by sending me your NAME AND MAILING ADDRESS and choice of stacks. Alternately, you may mail me a diskette and a SASE and I'll return it with your choices. My address is:

Diana L. Syriac
49A Meadow Pond Drive
Leominster, Mass. 01453

Although I do not have the facility to transmit these stacks via email or FTP, another person has volunteered that service. The stacks may be obtained by anonymous FTP at tank.uchicago.edu, located in the directory /pub/public, names similar to HamNovice.sit.bin (yes, these are in Stuffit format, so you need UnStuffit to access them). The latest upgrades for Novice and Technician will be mailed to Peter shortly.

Meanwhile, I'm still struggling with Morse code, having failed the 13 wpm test twice thus far.....sigh.... :-(

> Does anyone have a manual they might part with? The formula for ordering
> xtals would get me started.

I have a Regency MonitorRadio also. It is set up for Civil Air Patrol.
When the tones go off (on?) it opens the audio and it is loud. The
volume is not controlled by the volume control until the decoder is
turned "off". My problem is that when the unit decodes, the volume
produced is too loud. If I could get a schematic, I think I could
change the (probably fixed) resistor to make it softer.

I've opened it up and it is a jungle of point-to-point and I don't want
to hack.

So, please email if you can provide the "fix" I need, or a schematic and
operator's guide for copy + postage cost.

3908. are QSL cards really necessary for awards?

Newsgroup: rec.ham-radio
Date: 1989-11-09 17:07:55 UTC
From: doug@NISD.CAM.UNISYS.COM
Message-ID: <8911091707.AA21464@KRONOS.NISD.CAM.UNISYS.COM>
Source record: 15595

Recently the ARRL sponsored an Aniversary WAS that only required log extracts. No QSL Cards had to be submitted. As it turns out, that was probably the only time I would be able to get WAS. I rarely stay in a QTH long enough to get 50 cards back. I wonder, though, just how this approach worked. Was the forge rate high, or did hams honestly follow the rules? I would like to hear how ARRL felt about this program, as well as others who participated or observed.

3909. A Contesters Viewpoint on QSLing

Newsgroup: rec.ham-radio
Date: 1989-11-09 17:12:31 UTC
From: n2ic@druwa.ATT.COM
Message-ID: <12132@druwa.ATT.COM>
Source record: 15601

First of all, relative to W3LPL, I am a small-time contester.
My own call is only used for single-op efforts, which means I make,
at most, 1/4 of the QSO's made by W3LPL in a DX contest.

This is my personal philosophy on QSLing for contest QSO's. I will not
make any judgements about other hams' QSLing practices.

On the negative side .....

From here in Colorado, I work TONS of JA's in contests.
It seems that every JA sends me a card for every QSO, regardless of whether
they need Colorado on that band/mode. The poor sole who handles my
QSL's at the W2 bureau, sends me shipments in shoeboxes, or larger boxes.
(Thanks W2RQ !).

Before the sunspot cycle started heating up, I could barely handle the cards
from the bureau. I was typically 2 years behind, but I did get around to
returning all cards via the bureau. I kept a database of JA cards received
organized by call, band and mode. I felt good about helping out a new
JS1 with "first Colorado". But for Gods sake, why do people like
JF1SEK send me cards for EVERY 15 meter SSB QSO they have made with me ????
I must have 30 JF1SEK 15 meter SSB cards !!

Now that the sunspot cycle is up, along with the number of contest QSO's,
I am totally overwhelmed by incoming cards from the bureau. My only hope
is to print labels from my K1EA computer logs and QSL 100 %.
I haven't yet resigned myself to the cost.
For cheap cards, labels, shipping, and the ARRL outgoing QSL
bureau fee, I can't do it cheaper than 4 cents per card. When you
make 2500 QSO's in a DX contest, that really adds up !

On the positive side .....

I QSL 100 % to anyone who sends me a self-addressed stamped envelope.
In some cases, such as cards from an Eastern-block country,
I'll even spring for the stamp !

If I receive a card from someone who is obviously a new ham, I'll reply
directly to him/her.

When I receive a card with no envelope and/or stamp from a ham who should
know better (like a 1x2 call), the card goes into the trash.

Basically, show me that you REALLY DO want my card, and I'm glad to
reciprocate.

One of the other local hams, W0ZV, QSL's nearly 100 %. I know it helps
his scores in contests. I haven't resigned myself to 100 % QSLing yet.

Until I do QSL 100 %, for both contest and non-contest QSO's,
I can't whine about being beaten by him !

Steve, N2IC/0

3910. FCC ALLOWS UPS ON 220 NOW !!!

> please) guide to shortwave listening and was disappointed. Is there
> a good listing of SW stations out there somewhere. I would think the
> list should be posted to this group. It should have broad interest.

In addition to the WRTH and the Passport, you will find an excellent,
up-to-date listing of SW in English in 'Monitoring Times' magazine, which Grove
puts out, which you should be able to find in better magazine stores and radio
stores. Each issue has about 20 pages of station/frequency tables organized by
time of day, plus about 10 pages of program listings, plus good features,
columns, etc. Far superior to 'Popular Communications', the other SW mag.

The U.K. Department of Trade and Industry handles radio licences in the U.K.
Their address is:
Department of Trade and Industry,
Amateur Radio Licencing,
Waterloo Bridge House,
Waterloo Road,
London SE1 8UA.

Licence fees are collected by the Post Office:

Post Office Headquarters,
FA3.4RALU
Chetwynd House,
CHESTERFIELD
Derbyshire S49 1PF

I wrote to them with a copy of my licence and certificate of proficiency
(what you get when you pass the Australian amateur exam). They issued me
with a class A U.K. Licence not a permit! I pressume they have permits,
or have them now (I got my UK licence in 82) which would be much
cheaper than the annual licence fee of 12 pounds. One BIG advantage of
a licence rather than a permit is that you can use it throughout Europe
(if you are travelling) because the U.K. is a member of C.E.P.T..

3916. Butternut Vertical Questions answered

Newsgroup: rec.ham-radio
Date: 1989-11-09 20:10:12 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <180367@Wayne-MTS>
Source record: 15596

Granted, by the time my stuff gets posted it's usually old news, but
in answer to an inquiry:

The 62" length of 72 ohm cable is referred to by Butternut as a matching
section. What it matches, I don't know, but it is roughly a quarter wave
at 10 meters, so that must be where it's doing its transformation. The
antenna works very well with a good chain-link fence ground, by the way,
as many have suggested. I was 57 into Maine running 10W SSB from near Detroit
the other day.

Someone also asked about the R5; I've not played with this, though I have
heard very positive reviews locally about its predecessors, the R3 and R4.
They're half-wave antennas, and thus ground independant.
--mike ke8yy

3917. Product Review : KAM

Newsgroup: rec.ham-radio
Date: 1989-11-09 20:26:17 UTC
From: mslee@KRSNUCOM.BITNET
Message-ID: <8911092026.AA00836@snucom.snu.ac.kr>
Source record: 15720

I recently buy KAM at T.ZONE (Akiabara, Japan).
And I tried to connect it to my AT clone PC.
But KAM didnot react my typings though all the connection is VY OK.
I check all Computer I/F part of KAM circuits and finally
found some bad things.
RS-232C data (about +10 ~ -10V) from PC was guides by a resister and
a capacitor, and a negative voltage (~ -10V) is pulled at the TXD pin.
and the signal is entered to XOR gate (CMOS 4030, or 4070),
another input of XOR gate is pulled up to ~ 10V.
This will normally work well, but my problem is :
negative voltage of KAM is made with +12V and the specific
pull-down negative voltages are from op-amp(MC34074),
I found the negative supply voltage has VY MUCH ripples (10% or more.)
And this ripple makes interference to CMOS, so the output of
CMOS XOR is the SQUARE WAVE. (I had thought KAM's 68B03 CPU intentionally
make the square pulses for unique serial communication, hihi,
but oscilloscope drew the same pulse width of the ripple.)

My solution of this problem is :

1. Cut all the OP-amp driven pull-up and pull down of 4030(4070).
2. +10V -> 5V (VDD line , pin 14 of 4070(4030)) with series of 10K Ohm
3. -10V -> GND (GND line , pin 7 of 4070)

3918. Re: Tuning dipoles and antennas.

Newsgroup: rec.ham-radio
Date: 1989-11-09 20:54:51 UTC
From: timb@hpmwtd.HP.COM
Message-ID: <1260003@hpmwtlb.HP.COM>
Source record: 15591

John, I do mean it literally and I'm not talking about transmission line loss.

If you understand that what I mean by "transmitted power" is the maximum available power from the transmitter. This is the amount of power delivered to a matched load. This is also the power incident on the antenna if the transmitter is matched to the transmission line (say both are 50 ohms and neglect losses for the moment). A mismatched antenna causes a portion of the incident power to be reflected back to the transmitter. This reflected power is completely absorbed in the transmitter load if it is matched. For the purpose of radiating energy, this reflected power is lost.

So SWR does cause available power to be lost. If the antenna SWR is 2:1 then the reflection coefficient is 1/3 which corresponds to a mismatch loss of about 0.5 dB. While this may not sound like much on a logarithmic scale it is a loss of about 10% of the power which is nothing to sneeze at.

It may help to think in terms of a CW pulse. This pulse is launched onto the matched transmission line, propagates to the antenna where a portion of it is reflected by the mismatch. The reflected wave travels back to the source where it is absorbed (and lost to radiation or re-radiation) by the matched source load. This is, afterall, why finals burn-out if not matched properly. While the net power dissipated in the transmitter load may be zero (for an open or short circuit) the reactive currents flowing through the device can be enormous.

As for transmission line loss, you won't do better than an open parallel line. That is why I suggest it. Also, even if the line is mismatched to the antenna, the fields are confined and the line won't radiate much (if things are balanced well). This is not true of coax, since the outer conductor will support fields that are not confined and thus may radiate. This is energy that is lost above and beyond the normal resistive and dielectric losses. You may argue that it is not completely lost since it is radiated, but it is usually not controlled and may help or hurt the composite radiation pattern.

As for antenna efficiency as a whole, I would expect that a horizontal dipole with say 1 dB of transmission line loss could achieve an efficiency of about 70% or so. A vertical antenna will be somewhat less efficient due to increased ground (Earth) losses.

Personally, I have done pretty well with 100 watts and a good dipole and tuner. If you don't like the minimal effort of adjusting the tuner, then you can spend your time building tuned dipoles for every band and eventually burn-out your finals on a mismatched antenna system.

Let me know if this still doesn't make sense.

CONFAB '89
The 1989 Traffic Handler's Confab will be held at Rutgers University at the Busch Campus Center in Piscataway, New Jersey on Saturday, December 2nd from 11 A.M. to 4 P.M. Admission is free.

For those who don't know, I will quote David L. Wiesen -K2VX

Tentative agenda items: VHF nets and recognition of those involved, net manager reports, certificates and awards, recruiting and training, scanner law, and the Bulletin.

The confab is the anunual conference of those involved in amateur radio traffic handling in the state of New Jersey.

Directions to the Busch Campus Center:

* from route 18
Follow rt. 18 North until it ends. You will be at a traffic light. Go straight through the light (you are now on Metlars lane). Make the third left off of Metlar's Lane. You are now on Bevier Rd. Follow this road until it intersects with Bartholomew. Make a right on to Bartholomew and you will see the Busch Campus Center ahead of you on the left. Turn into either lot #51 or #59.

>From Route 1
Take route 1 to route 18 North (New Brunswick Exit). Then follow from * above.

>From the New Jersey Turnpike
Take the Turnpike to exit 9 (New Brunswick). Follow signs to Route 18 North. Follow from * above.

>From The Garden State Parkway
Take the GSP to exit 130 (Route 1). Take Route 1 South to Route 18 North and folloe from * above.

P L E A S E N O T E: Parking has been arranged for lots 51 and 59 ONLY. Parking in any other lot may lead to a ticket or tow.

If you have any further questions, I can be contacted at:

Jeffrey A. Schwartz - KA2QOU
RPO 6129 Box 5063
New Brunswick, New Jersey 08903
(201) 878-2340

or

jschwart@hardees.rutgers.edu

Talk in will be on 145.700 Simplex.

We are looking forward to seeing you at the Confab!

3920. Multi-tube Linear Amp Question

Newsgroup: rec.ham-radio
Date: 1989-11-09 21:58:17 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880094@hpfcdc.HP.COM>
Source record: 15589

I'm working on a multi-tube amplifier, and need some advice from the net. The amplifier isn't putting out as much power as it should (40 instead of 400), and I'm wondering if the pi tank is correct.

I used the formula Rp = Vp / (Ip*K) I think everyone recognizes this one. The question is whether Ip is for all the tubes, or for just one tube. Anyone out there have the answer ? Any wisdom on how to experimentally determine Rp (and hence tank component values) ? Thanks.

3921. Using A Dentron Clipperton-L On WARC Bands

Newsgroup: rec.ham-radio
Date: 1989-11-09 22:10:45 UTC
From: noel@ubbs-nh.MV.COM
Message-ID: <163@ubbs-nh.MV.COM>
Source record: 15605

I'd had it! After patiently waiting almost two hours for a "CO3" to get around to the "2" calls, only to be repeated be walked on by the big boys who refused to allow anyone running barefoot work the station.

So I went out and purchased a Dentron Clipperton-L amplifier.....

Anyway... the question at hand, can the Clipperton be used on the WARC bands?

If modifications are required I'd like to get the instructions for doing so, as well as any other modifications, hints, kinks etc.

3922. Magnetic effects

Newsgroup: rec.ham-radio
Date: 1989-11-09 23:41:59 UTC
From: BERTSCH-S@osu-20.ircc.ohio-state.edu
Message-ID: <12540965679019@osu-20.ircc.ohio-state.edu>
Source record: 15585

I just read a posting by Bill, KB3YV looking for info on the effects of magnetic fields on humans. Since my outgoing mail bounces so often I thought I'd post the reply here.

A very good book on the subject is:

The body electric: electromagetism and the foundation of life.
-by- Robert O. Becker and Gary Selden.

I found this in my local public library. One point that stood out from the authors research was that low frequency (60 Hz) fields were far more dangerous than HF thru Microwave (at the same energy level).

Steve N8KWV

3923. marvin server (again)

Newsgroup: rec.ham-radio
Date: 1989-11-10 00:26:29 UTC
From: bowen@cs.Buffalo.EDU
Message-ID: <13035@eerie.acsu.Buffalo.EDU>
Source record: 15586

A lot of people wrote and said they couldn't find my message about using the callsign server so I'm reposting.

I just installed the new data for the marvin callsign server. So it's fresh as of whenever Rusty got the tape cut. If you notice any problems with it please let me know.

For those that aren't familiar with the server, it's a telnet based server that you can connect to if you have Internet access. The machine name is marvin.cs.buffalo.edu (128.205.32.4) and the port number is 2000. For most machines, the connection would be made with a command like

telnet 128.205.32.4 2000

But your system may be different. If this doesn't work, I'd suggest asking your system administrator for assistance.

Once connected, the "info" and "help" commands can get you started. The server allows you to lookup callsigns by last name, callsign or city/state. Many new additions will be coming as soon as I get some time.

Enjoy...

Devon

3925. 20M Debacle - Letter From FCC?

Newsgroup: rec.ham-radio
Date: 1989-11-10 02:11:35 UTC
From: pff@thumper.bellcore.com
Message-ID: <1773@thumper.bellcore.com>
Source record: 15580

Gang,

I downloaded this from GEnie last night. While I can't vouch for its authenticity, I thought it might be of interest to some. Please excuse me if this has already been posted - due to a long chain of events (locally called "Micom security improvements" - ahem!) - many newsgroups have been rather bizare in respect to whether or not we get them, etc.

Anyhow, here's the file, as I downloaded it, unaltered by me:

This is the text of the letter that the FCC mailed to
numerous participants in 20 meter net activities.
- - -
FEDERAL COMMUNICATIONS COMMISSION

Dear Mr. [amateur's name]

This letter is being sent to you because you may be serving in an influential position with respect to third party telephony traffic, information bulletin or telegraphy practice communications transmitted on the amateur service HF bands. You may possess, therefore, information and insight that could help bring about a resolution of the unfortunate continuing over-the- air dispute that takes place on the amateur service 20 meter band. A similar letter also is being sent to other amateur operators and organizations who may be of assistance.

We fear that enhancement of international goodwill -- a fundamental principle of the rules for the amateur service in the United States -- is being jeopardized as a direct result of this dispute. We are concerned, moreover, that the experimental nature of the amateur service is being suppressed. When a channel is used to carry on a never-ending debate, it is denied for the purposes for which the frequencies were allocated. Finally, requests to the Commission to resolve the dispute are diverting far too much staff time from other essential activities.

The Commission has, on numerous occasions, provided guidance to amateur stations conducting third party communications. In the Report and Order in PR Docket No. 88-139, for instance, the Commission concurred with the American Radio Relay League's observation concerning the proper balance in the rules between the flexibility to achieve the objectives

of the amateur service and the degree of protection necessary to prevent exploitation of the service. The amateur service should be allowed to utilize its allocated frequencies unfettered by encroachment from commercial entities. It should not be allowed to be exploited by those who would use them as an alternative to the land mobile, broadcast, maritime, or common carrier radio services.

For the above reason, Section 97.113(a) of the Commission's Rules, 47 C.F.R. Part 97.113(a), prohibits an amateur station from transmitting any communication the purpose of which is to facilitate the business or commercial affairs of any party. No amateur station shall transmit communications as an alternative to other authorized radio services, except as necessary to providing emergency communications under Sections 97.401-97.407 of the Commission's Rules, 47 C.F.R. Part 97.401-97.407. In the Order adopted June 29, 1983, 48 Fed. Reg. 32999 (1983), the Commission stated that the term "business" in this instance, is used in the broadest context. It includes all types of communications which are intended to facilitate the regular business or commercial affairs of any party, whether individual or organization, whether for-profit or not-for-profit, whether charitable or commercial, and whether government or non-government. By Public Notice titled Amateur Service International Radiocommunications dated September 1, 1989, the Commission further elaborated upon the scope of Section 97.113(a): All types of communications relating to business activities, including the advertising, soliciting, ordering, furnishing, delivering, accounting, or billing of any supplies, materials, or services are prohibited.

Although Section 97.115(a) (1), 47 C.F.R. Part 97.115(a)(1), permits an amateur station to transmit messages for a third party to any station within the jurisdiction of any foreign government whose administration has made arrangements with the United States, all international communications by amateur stations are subject to Section 97.117 of the Commission's Rules, 47 C.F.R. Part 97.117, which limits amateur station transmissions to a different country to messages of a technical nature relating to tests and to remarks of a personal character for which, by reason of their unimportance, recourse to the public telecommunications service is not justified. This rule conforms to the international Radio Regulations applicable to the amateur service.

Considering the above limitations, it is not apparent why there should be any significant amount of third party communications transmitted in the amateur service. It appears, however, that as much as 15% of the 20 meter band

is being claimed for such communications by some amateur operators and by organizations apparently organized specifically to utilize the amateur service for third party telephony communications. The justification for any such entitlement, however, has not yet been made to the Commission. Nor does it appear, as evidenced by the presence of the on-the-air dispute, that any such privilege claim has been accepted by the entire amateur community.

Our approach has been to allow the amateur community to resolve the issue in a spirit of cooperation, as it has for many issues several times in the past. Because this approach has not been effective in this instance, we are looking to other alternatives. One alternative approach may be rule making that could range in outcome to an outright ban against all third party traffic to the designation of specific channels in some segment of certain amateur bands where only third party telephony communications could be conducted. Before taking so drastic a step, however, we want to gain a better understanding of the issues behind the dispute.

We request your cooperation in resolving this matter. We therefore ask that you submit a report to us on the matter by November 15, 1989. While the submission of the report is voluntary, failure to submit it may mean that we have to proceed without the benefit of your expertise. Your report should include the following information based upon your personal observations during periods when the amateur service is not generally being used to provide emergency communications under Subpart E of Part 97, 47 C.F.R. Section 97.401-97.407:

(1.) Is there, in your view, a channel plan? What is the channel plan for the analog emission segment of each amateur service HF band? What is the channel spacing? How many channels are utilized for telephony in each band?

(2.) How many channels in each analog emission segment are used by Commission-licensed amateur stations for domestic third party telephony communications? What is the general nature of these communications? How many phone patches are transmitted per channel per day? What effect does the transmission of such communications have upon the amateur service? Why isn't a public telecommunication system, maritime service, or other radio service used for such communications?

(3.) How many channels in each analog emission segment are used by Commission-licensed amateur stations for international third party telephony communications? What is the general nature of these communications? How many phone

patches are transmitted per channel per day? What effect does the transmission of such communication have upon the amateur service? Why isn't a public telecommunication system, maritime service, or other radio services used for such communications?

(4.) How many channels in each analog emission segment are used by Commission-licensed amateur stations for information bulletin telephony communications? How many amateur operators listen to one of these transmissions? How many information bulletin communications are transmitted per day? What effect does the transmission of such communications have upon the amateur service? Why aren't amateur digital systems used exclusively for such communications? What stations transmit such bulletin type messages? Is the transmission of such messages desirable or necessary?

(5.) How many channels in each analog emission segment are used by Commission-licensed amateur stations for telegraphy practice communications? How many persons make use of these transmissions for telegraphy practice? Why is an analog emission segment used for such communications? What effect does the transmission of such communications have upon the amateur service? In view of the availability of recorded telegraphy training material, why are amateur service frequencies still used for this purpose?

(6.) Please suggest a statement of practices that you believe should be followed by amateur stations transmitting third party communications, information bulletins, and telegraphy practice. Comment on whether the amateur service can voluntarily adopt your suggested practices, or should Section 97.101, General standards, 47 C.F.R. Section 97.101, be expanded.

Please feel free to provide any other factual information that would assist in a more complete understanding of the issues involved in the dispute. An envelope is enclosed for your reply.

Thank you for your cooperation.

Sincerely,

Robert H. McNamara
Chief, Special Services Division

That's it. I think this may tie in with some recent subject matter being discussed here. My gut <<impression>> is that the above text is authentic.

3926. Bearcat 800XLT Guru Needed

Newsgroup: rec.ham-radio
Date: 1989-11-10 02:21:38 UTC
From: pff@thumper.bellcore.com
Message-ID: <1774@thumper.bellcore.com>
Source record: 15581

Lately my Bearcat 800XLT seems to be getting "tired". Specifically, if I leave it on for several hours (maybe a day or so), turn it off for awhile, then turn it on again, the display is VERY dim. I have NEVER liked the display - especially mobile. I always thought it was dim when compared to say an old 210XLT I used to own, etc. On a sunny day in the truck, forget it! But for the past year or so I've been running it strictly off of AC (de-spiked at that!). Sooo, no matter when I turn it on, the display is almost not visible, and gets usable after maybe 45 seconds or so. Any suggestions? Hint: I don't have any service manual / schematic for the creature (but wouldn't whine if someone wanted to photocopy one for me :-)). Any part#'s, etc; will have to referrenced accordingly (ie; "The third IC over in the second row...").

Bob Parnass, are you reading this? Anyone else? HEEEeeeeellllpppp!

Many thanks!

Please e-mail your best bets to:
Pete Ferris, N5KBD

>but for the public good! If they would simply bust some jerks instead
>of making more things illegal when they aren't willing/capable to
>enforce the laws that are ALREADY on the books things would be
>a lot more civil.

HEAR HEAR!!!!!!! Typical bureaucracy... Never enforce the law, that
costs too much money! Simply make a NEW one and that makes everybody
think that you are doing something POSITIVE! COW MANURE!

Let me tell the net a little story... well a LONG story! About 10 years
ago a fella showed up on the local repeater using the call WB4EYE. Some-
thing about him didn't ring true so I looked him up in the callbook. Hmmm.
No WB4EYE listed, PLUS this guy says that he got his ticket very recently
... and got a WB4 call? Not likely.

So myself and a few other guys engage this fella in a nice conversation
while alerting each other over the phone to start recording this whole
thing. We then actually talked the guy into meeting us for a cup of coffee!
Well, he actually showed up and we then asked him to see his license. He was
VERY upset and wanted to know why. We told him that we suspected he was a
bootlegger and would sincerely apologize if he could produce a ticket...

Well, he left it at home don't you know! (Yeah right) In any case, we warned
him to stay off the air and to not use his radio again until he could produce
a valid amateur radio license. We even told him where there were some local
amateur classes being held if he wanted to try and get a valid ticket, but
he wanted none of that "since he already had one". By the way, we actually
got his name and address in the process. Well, then our repeater started to
get jammed and suspecting where it was coming from, it wasn't too hard to DF.
We called the FCC in Norfolk and they really could have cared less. They told
us to call the Federal District Attorney for our state!

Then all of a sudden all the jamming stopped and we heard no more from this
fella. ONE YEAR LATER, a guy comes on the repeater again using the call
WB4EYE (I guess he thought we all must have left the area) and sure enough
our same old friend is back. We call his parents and find out that he has
joined the Navy! We trace him back and call some of the local repeater ops
in the places he has been and sure enough, they all remembered him but never
realized he was a bootlegger (he had gotten pretty good by this time). So

out came the recorders again and we all start calling the FCC. Again these people could have cared less and said (and I quote) "As long as he is not causing interference to emergency communications, then we really have no time to deal with it". We told them we had the tapes from BOTH times and had witnesses to the whole thing... IT DID NOT MATTER! We then called the Federal District Attorney and he LAUGHED at us (can't say I blame him!).

We put the word out on one repeater after another about this guy, but he would continue to just move around to different repeaters. Then we heard that he had bought a HF rig and was putting up antennas. This was a little much, plus by this time I was getting seriously P.O.'ed at this guy, since the jamming on our repeater was starting up again.

Well, we finally had a brain storm. Being that I was in the Marine Corps and so were a few other hams in the area, and that there was a retired Navy Captain in the club.... we decided to prefer charges on this guy under the UCMJ (Uniform Code of Military Justice). Ran up a real neat list of charges and had everybody sign them. We took this mess to his Commanding Officer. At first he was not impressed, but then the C.O. took a look at who had SIGNED the charge sheet and ALSO that we were sending a copy to SECNAV (Secretary of the Navy). Now THAT got his attention REAL quick! Well, he brought in this jerk and then confiscated his ever present handheld and put him up for NJP. So ... in the end, we finally got the SOB, but NOT with any help from the FCC.

With all the discussions I read on this net concerning what is legal and what is not, it always strikes me as ironic that this guy didn't even need a license to operate any amateur gear that he wanted to!

I am really curious... would any brave souls stand up and tell the net when they were last or EVER violated by the FCC, even for an honest mistake? I have NEVER received even a warning in over 20 years! That's not saying I didn't DESERVE a few... but I or no one that I know EVER got one!

These days we have intentional jamming of emergency communication nets, we have self appointed FCC reps "taking over" frequencies, profanity galore on 75 meters (in fact a LOT of bands) and who knows what else! Is there then any need to argue whether it is legal to order a pizza on the autopatch, or whether digital music files are legal, or phone patches, or etc., etc.? I am starting to think that you really can do just about anything and get away with it, because complaining to the FCC just pisses them off to where they will "teach us a lesson" by passing some new and ridiculous law and then we can argue about that!

Self policing is a joke if we have no enforcement arm.

BERTSCH-S@osu-20.ircc.ohio-state.edu (Steve Bertsch) writes [in part...]:
>I just read a posting by Bill, KB3YV looking for info on the effects
>of magnetic fields on humans. Since my outgoing mail bounces so often
>I thought I'd post the reply here.
...

Having missed the original posting, let me add three more pointers:

Biological Effects of Power Frequency Electric and Magnetic Fields
a summary prepared by the Office of Technology Assessment, US Congress
ca 100 pps, $4.75 from the US Government Printing Office. GPO book
stores are in "major cities". Order desk phone number is
202-783-3238, they take Visa, M/C, etc.. Order number is
052-003-01152-2.

Reportedly, there is an article on this subject in the November '89
issue of Consumer Reports.

Also, some discussion is going on the net in sci.skeptic, started
about two days back, just picking up "volume" now...

There is a series of articles by Paul Brodeur in the June issues
of The New Yorker. I have reservations about these articles.

..
>
>I found this in my local public library. One point that stood out
>from the authors research was that low frequency (60 Hz) fields
>were far more dangerous than HF thru Microwave (at the same energy
>level).
>
>Steve N8KWV

FWIW, this does not match my understanding, or my understanding of the
data and conclusions in the OTA Study, for one. Briefly, OTA study seems to
be saying (as I read it...):

There have been "effects" demonstrated, reproducibly, in lab work.
We can't tell now if there is a risk.
If there is a risk, it is probably small.
If there is a risk, it is not just due to "high voltage lines".

BIG DISCLAIMER: These are my PERSONAL Opinions.

Thanks, Tim. It certainly makes sense that if the reflected energy sees
a matched resistive load, it will be dissipated in that load. That must mean
that when you are using a tuner, the reflected energy does *not* see
a matched resistive load and gets re-reflected back down the line.
Same thing for any impedence matching network (tank circuit in the final).

When I made my comments, I guess I was thinking there was some impedence
transformation device at the transmitter.

Thanks for clearing this up.

> It is not necessary to have a resonant antenna to efficiently radiate energy.
True, but resonant antenna has the remarkable ability of NOT creating
cancelling fields. This is like putting energy into pushing as well as pulling.
I have a perfect match to my G5RV on 10M, but its 32M length is no match for
radiation efficiency to my 2:1 matched 5/8 wave 6M long antenna. Granted 1/8
of a wavelength of my 5/8 is cancelling some of the field, but the G5RV
cancels every 10M leaving only about 4M of radiating section with a heluva lot
of loading in between doing nothing.

> If an antenna is matched to the source, regardless of how it is matched,
> all the energy sent down the transmission line is radiated.
Nope, some of it is heating the air :-{ cancelling itself out.

3933. why JAs send multiple QSL cards

Newsgroup: rec.ham-radio
Date: 1989-11-10 17:53:19 UTC
From: kawai@csli.Stanford.EDU
Message-ID: <10992@csli.Stanford.EDU>
Source record: 15606

Steve (N2IC/0) writes:

> It seems that every JA sends me a card for every QSO, regardless of whether
> they need Colorado on that band/mode. ... But for Gods sake, why do people
> like JF1SEK send me cards for EVERY 15 meter SSB QSO they have made with me?

Oriental courtesy requires that you express your gratitude over and over.
In the United States, I have noticed that if you are invited to a party,
you thank the host when you are invited, when you arrive at the party,
when you leave, and later, you may send a thank you card. However, I rarely
see people thanking each other some time after the event. Not to say that
they are not grateful - it is just a difference in customs.

In the far east, Chinese tradition (especially Confucian teachings) require
that you repeatedly express your favorable emotions towards others.
Therefore, if you feel grateful, it is polite to repeatedly assert your
gratitude. In amateur radio, this principle is realized as multiple QSL
cards, which means, "I thank you for another enjoyable QSO with you, dear
OM. You are not one of those operators with whom I may engage in polite
conversation, but actually not enjoy it very much. I want to be friends
with you. To show my sincerity, I am sending you multiple cards, even though
I know this is redundant, not to mention time and money consuming. I will
not necessarily be hurt if you do not reply - I know that Americans do
not recriprocate as heavily as we do in the far east - but I would appreciate
it if you could kindly remember me and the nice QSOs we have had. If you
hear me on the bands, do drop me a call. If I hear you, I would like to
call you again. My English may not be good - I hope my actions express
my true feelings, which I cannot adequately enunciate with my English."

The main reason you do not receive multiple cards from HL, BY, BV, HS,
and 3W is not because they are not part of this cultural tradition, but
because QSLs cost money. A minor reason is because you don't often have
multiple QSOs with hams from these places!

My thanks to Diana for putting together these hypercard stacks. I've been in a novice ham radio class now for only two weeks. I got the stacks off of tank.uchicago.edu yesterday. Even though I'm only 1/2 way through "Tune in the World with Ham Radio" I still managed an 80% on my first crack at the NoviceHam stack! (That's enough to pass, right? Rest assured I'll study the rest of the manual before I take the real test.) Anyway, I anxiously await the posting of the updated stacks (I've got the October 20 tank.uchicago.edu versions).

AND....

Are there any Macintosh programs out there for Morse code practise?

I have to back further than 20 years. I remember getting several ARRL OO reports and two slips from the FCC 'round about 1964 when I was in high school and a new ham (WA8HBS). One of the FCC warnings was when I accidently slipped just below the band edge. The other was for having a second harmonic that they detected outside the ham bands. For the latter, I had to write to them and explain what I was going to do to fix up my transmitter. To a high school kid, getting slapped by an agency of the Federal Government was kinda scary back in those days, and I took it all very seriously (so did my parents). But it did impress me that transmitting radio was a responsibility as well as a hobby. The impression it made was strong enough that I have never knowingly violated the provisions of my license since then (well....I have kerchunked a repeater a few times).

Thanks, Mark, for an interesting story.

i have tried used the cross-band repeater features of both the ft470
and the ic32at, and must say that the ft470 does not perform nearly
as well. the repeated signal from the ft470 sits under a good deal
of noise, whereas the added noise from the ic32at is negligible.

3938. QSLing - another twist

Newsgroup: rec.ham-radio
Date: 1989-11-10 18:53:39 UTC
From: oo7@ut-emx.UUCP
Message-ID: <20760@ut-emx.UUCP>
Source record: 15613

I just received a reply to a QSL card I sent for a South Shetlands station. The manager (an HL) sent my card, but also sent me 6 other cards, in sealed enevlopes, to send on to other USA stations. Being a Good Guy, of course I'll shell out the $1.50 to do this. He did send me a couple of IRCs to help towards the cost.

I've had this happen several times, and usually I have to supply the 25c stamp, or even a 45c one to send a card to S. America. But if all these 6 guys whose cards I'm supposed to send on actually sent 2 IRCs with their requests, it's a pretty good deal for the manager: input = 12 IRCs, output = 2 IRCs to have good old AA5BT send the cards on.

On the other hand, maybe these W stations sent SAEs but no return postage, and this is a way of getting cards to them cheaply. Most managers would use the bureau in this case, though, I suspect.

Still, I wonder if this practise explains why I sometime don't get my cards returned - they are sent via (insert name of your favorite non-QSLing contester here) and never get forwarded.

In a similar vein, I always feel a little cheated when I have sent 2 or 3 IRCs and an overseas card comes back with a 25c stamp on it, from NYC. Still, I was willing to spend the money on getting a card, and I got a card, so I shouldn't complain, right?

Chuck writes, "You could rewire a tube car radio into a 6 meter
transceiver without too much trouble."
I go back at least that far in fooling around with radios, but I never did
find or hear of a way to convert the 200-meter radios (tube, transistor;
car or home) to a 6-meter rig without an awful lot of trouble. Perhaps
Chuck refers to some of the "add-on" transverters that have been used in which
the auto radio became a tuneable IF for the Rx, and a completely separate
the auto radio became a tuneable IF for the Rx, and which included a completely
separate transmitter circuit........

I wrote a question if Ham radio exists in China, and how restricted it is,
etc, on soc.culture.china newsgroup. Below is a response posting that
appeared on scc:

>From: shuang@alberta.uucp (Shuang Deng)
Newsgroups: soc.culture.china
Subject: Re: Ham radio in China
Date: 9 Nov 89 01:46:15 GMT
Organization: U. of Alberta, Edmonton, Alberta, Canada

In article <67119@philabs.Philips.Com> rfc@briar.philips.com.UUCP (Robert Casey) writes:
>... Maybe trying to get an amateur radio license
>there would attract a lot of undesired "attention". Anyone know?
>---
>73 (best wishes) de (from) WA2ISE (my radio callsign) rfc

Sure, big brother has been listening already.

I don't know the regulation on amature radio in China.
But I had used both radios (HF & UHF) and satellite transmitter
for data communication in China. As far as I know, there have been
lots of attention already. First, purchase and installation of
any (communication) radio have to get approval from local
Administration Commission of Radio (ACR) in advance. The frequency
intended to use must be registered at ACR. Then, the actual use
of radio will be monitored by ACR and some other agents.

One morning, on their way pursuing better data communication quality,
some of my colleagues forgot the rules and tuned out off our specified
frequency for a while. In the afternoon, investigators came to our
lab. Boy, they not only pinpointed the location, but also decoded
almost all messages!

The government control is basically effective on senders only.
Occasionally, we did turn to other users' frequency to listen their
conversions as taking a break in frustrating experiments. With a 50
watts HF radio in Beijing, we could listen some guy yelling from
Guangzhou (in southern China) to Bao3ji1 (in western China).

(end of his posting)--

I suppose that these guys can hear American hams talking to each other.

I know someone who grew up in China, and he once built a small FM broadcast
band transmitter (a few milliwatts at most) just to see if he could do it. He
set it transmitting an unmodulated carrier, then rode a bycycle with a radio
to see how far he could recieve it. Then he went back home to turn it off

quick before it would get noticed by thier "FCC". Seems that he would have gotten into big trouble if they found him. I did the same thing back before I was a ham. I suppose that it would take a few hours for the Chinese fcc to (a) notice it, (b) fire up thier tracking van, or equivalent, and (c) DF it. I suppose it would take the FCC a week or more to notice mine, and maybe another week to even worry about it. I guess that he might get jail, I'd get told to not do it again, at worse a small fine.

Anyway, I suppose that we should be glad that the FCC doesn't listen to the ham bands that much. I'd put up with a few bozos like the ones on 14.313 (or whatever) rather than having an FCC that comes down on you if you so much as sneeze on the air. This doesn't mean that I like the bozos, but I would err on the side of too little control than too much. One thing for sure: any bozo who intentionally interferes with emergency traffic should lose thier license, or worse.

(please e-mail any flames)

Funny, I just had a similar experience with a VU ham. I felt a little
odd about it. I sent the card on, supplying the envelope and postage because
I like to think of myself as a Good Guy (regardless of what Boulder County
thinks of me because I'm a ham) but I felt a bit used. It was presumptuous
of the DX ham to assume that, because I'm an American, I'm defacto fortunate
enough to have the resources to indulge him. I know US hams who would not
be able to do this. I'm curious why some DX hams don't just send their
outgoing QSL's via a buro? Is it an underlying philosophical problem with
bureaus, or are their bureaus unreliable?

This is not an act of self-policing. This is vigilantism, maybe even terrorism. Who are you anyway, some self appointed lord of harassment.

How would you respond if surrounded my men you had never met and they demanded that you produce certain documents for their inspection.

The (civil) police can't to this and I think the Attorney General's office would think considerably less kindly about this act than any transgression of the FCC's rules.

What if your kid comes home from school some day and a gang of his alledged peers do this to him. How do react in that situation? Anger? Rage? Violence?

The bottom line is that Amateur Radio is a privledge, but it's still just a regulated HOBBY.

>Only in the past ten years have nanofarads come into use

So far the unit seems to be most popular in Europe. Unfortunately, it's still almost unknown in the US. It's so much easier to say "10 nF" (a common enough value) instead of .01uF or 10000 pF.

How many people do you know who know the peta- and exa-
>prefixes, and the femto- and atto- prefixes? (Admittedly not useful to most >of us, unless you're measuring the circumference of Pluto's orbit in electronic >radii....;^)

Some of these larger prefixes are becoming useful when describing the size of digital databases, or the number of bits you can send over a fiber in a day, or the average age of the US ham population. :-)

Actually, the differences between cgs and MKS are trivial in comparison to the *real* problem, which is the brain-damaged English system of units. It's a considerable embarassment to me as an American that we're still not metric. I for one would love to take all the money that's currently being wasted on "OSI migration" in the US and put it into going metric. (See? I'm not an American with an NIH syndrome. When the Europeans -- even the French -- come up with an idea that's actually *better* than what we're already using, I'm all in favor of converting.)

This has very little to do with Ham Radio, but I figure that it can hurt, so here goes.....

Recently I took over as the Technical Director of our Campus radio Station , WNDY-FM. I did this for three reasons, 1) a personal favor to the General Manager, 2) a ham background, and 3) I was the only one they knew who could figure out which end of a soldering iron to grab.... (liberal arts colleges are fun..) I am a History and Technical Theater major.... but I ramble on. The problem is as follows. WNDY has recentely upgraded to 3000 watts ERP. The antenna is right on campus... Major lobe goes directly across town. We have the reputation of being the "station you can pick up on your toaster". We are causing QRM to everything in sight. The Kappa Sigma fraternity house on campus objects to us being heard on their phone lines. We have to keep the 3000watts to keep our advertisers, though. How can I cut down on front-end loading, without cutting power, or installing filters on every blessed thing on campus? Any ideas?

de Todd Perry, "Mr. Lapsed Licence..."

p.s. I'm getting back into the Ham end of radio. Anyone want to get rid of a used HT or HF rig? The Eico rock-bound rig i used to use has had it, and I'd rather buy used from another ham anyday..........

I don't have the scanner so I can't say, but you CAN get it cheaper. I have
my Grove catalog in front of me and they have it for $249.00. It has 40
channels (two banks of 20), 15 ch/sec scan rate, covers 29-54, 136-174,
118-136, 406-512 and 840-912 Mhz.

And for those with $$$$, Grove is selling the R9000 for $4795.00. Not bad
for a receiver retailed at $5495.00.

I am far from an expert on this, so anyone, feel free to correct me, but I believe that 'spy numbers transmissions' refers to the seemingly random and meaningless strings of numbers that can occasionally be heard on shortwave radio. They are believed to be coded intelligence reports of spies in foreign countries, sending their info back home over the airwaves.

> I received my DAK catalog yesterday, and saw a scanner for sale. $299 for (I
> can't remember) a Bearcat 800XLT (?). Is this a decent scanner?

The 800xlt has 40 channels in two banks of 20 each. DAK is no bargain
here. I think the Uniden/Bearcat 760xlt 100 channel scanner with
service search and wider frequency coverage is a better value for
about $279 from Grove Enterprises (in Brasstown, NC).

I've owned both models -- two 760xlts, in fact, and I still use one
daily. If you absolutely must buy an 800xlt, Grove's price is
only $249. The best current model scanner is probably still the
Radio Shack PRO-2005, which Grove lists for $389.

Attached is my 'dated' review of the 800xlt, written long before
the 760xlt era. In summary,

"The 800XLT's tendency to overload on strong signals and
awkward squelch action detract from an otherwise good
performance."

x-------------- CUT HERE --------------------------------------x

- 1 -

OWNER'S REPORT: UNIDEN/BEARCAT 800XLT SCANNER

Bob Parnass, AJ9S

Manufactured in Taiwan, the 800XLT is the first programm-
able Uniden/Bearcat scanner to cover a portion of the 800
MHz band. Covering 40 channels in 2 banks the 800XLT is
specified to receive in the following ranges:

TABLE 1. 800XLT Frequency Coverage

```
_________________________
| 29 - 54 fm|
| 118 - 135.975 am|
| 136 - 174 fm|
| 406 - 512 fm|
| 806 - 912 fm|
|_________________________|
```

Only a portion of the new 902-928 MHz ham band is covered.

Differs From Past Models

There are several differences between this scanner and its Bearcat predecessors.

- There is only a single scan/search speed: fast!

- 800XLT channel banks contain 20 channels, not 10 as in previous models. Although we should be thankful for the inclusion of a channel bank feature, doubling the number of channels in a bank is a step backwards.

- Scan delay, channel lockout, and priority enable are indicated by separate, colored LEDs rather than the numeric display, making a colorful light show.

- Both the selectable scan delay and the priority sampling period are 3 seconds vs. 2 seconds in the older scanners. Although a matter of personal preference, I like the 3 second scan delay, but would opt for a 1 or 2 second priority sampling period.

- Despite claims on the 800XLT box to the contrary, a 2 digit channel counter is displayed while scanning, as in the BC350, rather than "rolling zeroes" of the BC210/220/250/300. This is unfortunate, as rolling

zeroes make it easier to discern what channels are locked out from scanning without having to step through each one manually.

- The keyboard has a good feel, although quite different from the "chicklet" keyboards on Bearcat 250 and 300 scanners. Keys travel further, with less of a positive click. The 800XLT keyboard is much easier to read, as each key has its function printed right on the keytop, rather than labeled above it on an inlay.

- The 800XLT seems to lack "window detection" circuitry, so the scanner may stop prematurely (off frequency) in the SEARCH mode.

- There is no date of manufacture stamped on the cabinet.

- Mobile DC power cord is optional, but is supplied as standard equipment with other Bearcat scanners.

Inside Appearance Pleasing

The inside of the 800XLT consists of 3 circuit boards:

1. a main receiver board, containing vhf/uhf front ends, IF stages, audio amplifier,

2. a feature board, containing microprocessor and keyboard logic, and

3. an 800 MHz front end board, which uses surface mount components.

The boards appear very neat, and it is obvious that computer aided design and automated component insertion techniques were used. What a welcome change from the chaos inside a hand assembled BC250!

No schematic diagram is furnished. Whereas the identity of many of the ICs in earlier Bearcat scanners was obscured by the use of "house numbers", the ICs in my 800XLT are clearly marked with their original designations (e.g. National LM382). This makes repair easier, as one may obtain parts from several sources rather than being forced to buy from Uniden.

- 3 -

Side-by-Side Performance Comparison

Side-by-side tests were performed, switching a Butternut SC3000 tri-band antenna at 20 feet among 3 scanners: the 800XLT, a new Bearcat 260, and an old Bearcat 300 workhorse. The test equipment used was a pair of human ears, which we all use when scanning.

As the following table shows, the 800XLT was more sensitive on some frequencies, but suffered much more overload from strong signals. This is important if the 800XLT will be used with an outdoor antenna. The 800XLT had fewer annoying birdies than the other models tested.

- 4 -

TABLE 2. Performance of Bearcat 800XLT vs. 260 vs. 300

Band	Bearcat 800XLT	Bearcat 260	Bearcat 300

On the 800 MHz band, several police, business and cellular telephone stations were received using the supplied 3" antenna. Clear reception of a repeater used to dispatch Chicago Tribune photographers was possible from 50 miles distant.

The 800XLT audio output is clean and strong, with little synthesizer whine.

- 5 -

Early Problem Fixed: Memory Loss

My 800XLT lost its memory contents when unplugged from 117VAC, even though loaded with a fresh pair of alkaline AA batteries. The problem was traced to a metal contact, installed backwards in the battery holder. Repair required desoldering a red wire, repositioning the contact, then resoldering the wire. No further memory problems have been encountered.

Too Much Hysteresis in Squelch

There is too much "free play" in the stock 800XLT squelch control, the same affliction designed into Radio Shack scanners. The remedy consists of replacing the 860K ohm resistor on pin 14 of the MC3359P IC with a 2.2M ohm resistor.

Not As Selective as Older Bearcats

At -55 dB @ +- 25 KHz, the 800XLT IF selectivity is not as good as the BC350 and BC300, which are rated at -60 dB @ +- 25 KHz. The wider selectivity causes the scanner to stop prematurely in the SEARCH mode, and makes it difficult to determine, for example, if a station is transmitting on 855.0250 as opposed to 855.0125 MHz.

Since the 800XLT tunes in 12.5 KHz steps on the 800 MHz band, the wider selectivity is handy when scanning telephone cell sites, which are on channels spaced on 30 KHz apart.

Overall Evaluation

The 800XLT is the most conventional and easiest to operate of the new 800 MHz-capable scanners. It is plagued neither with the slow scan/search rate of the Regency MX7000, the low audio output of the MX4000, nor the unfriendliness of the Yaesu scanning algorithms.

The 800XLT's tendency to overload on strong signals and awkward squelch action detract from an otherwise good performance.

Can anyone recommend a Packet BBS program running under CP/M for a two floppy Kaypro II? We just got this machine as a donation to the campus amateur radio club and are trying to find something useful to do with it. Many thanks. Please direct E-mail to the following address:

3955. Re: 2 way radio in China

Newsgroup: rec.ham-radio
Date: 1989-11-11 16:33:58 UTC
From: kawai@csli.Stanford.EDU
Message-ID: <11004@csli.Stanford.EDU>
Source record: 15631

On the topic of ham radio in the People's Republic of China:

Only club stations (most of them university stations) were allowed until recently. Nowadays, people have started receiving individual callsigns, and use club station equipment.

The recent influx of BY stations, especially some of the 2-by-3 callsigns, seem to be a result of this.

I did not know it was possible to even purchase ham radio equipment for private use - perhaps the original author in soc.culture.china was talking about two-way radio gear for research use. It is illegal to own devices that can be used to disseminate information in the PRC. For example, it is illegal to own printing presses. Perhaps the rules have changed. A friend of mine from Shanghai told me that if you have a VCR, you must register it along with all the tapes you have with the nearest police department. An adventurous individual who had been secretly watching soft porn video tapes (smuggled from Hong Kong) with his friends was arrested and sentenced to two years hard labor. (Which, as you probably know, means he has a very slim chance of getting a respectable job for the remainder of his life.)

The above info is all hearsay from what I believe are informed sources.

Have any of you engaged in a meaningful ragchew with PRC hams? I can only manage to get quick contest exchanges. My Mandarin is certainly not native speaker quality, but much better than a regular non-Chinese ham's, and I would like to try it out.

3956. REC.RADIO.SHORTWAVE voting results: 265 yes, 10 no

Newsgroup: rec.ham-radio
Date: 1989-11-11 18:38:59 UTC
From: rshapiro@BBN.COM
Message-ID: <48092@bbn.COM>
Source record: 15630
Cross-posted to: news.groups,news.announce.newgroups,rec.ham-radio

Rec.radio.shortwave passes with a comfortable margin: 265 yes, 10 no.
In accordance with the guidelines, the complete list of votes appears
at the end of this article.

The distribution over time was as follows: 84% of the votes were cast
in the first week (including 9 of the 10 'no' votes); another 10% the
second week; and the rest dribbled in during the rest of the period.

I'm working right now on the getting the swl-l gateway set up.
Hopefully it will be in place not long after the group is created
(assuming no problems arise during the 5-day waiting period).

Thanks to everyone who voted.

YES votes

From: karn@ka9q.bellcore.com
Message-ID: <18189@bellcore.bellcore.com>
Source record: 15632

>In article <8910310803.AA27197@ucbvax.Berkeley.EDU> 702WFG@SCRVMSYS.BITNET (bill gunshannon) writes:
>>But today things are different. Today you can call anywhere in the world
>>from the comfort of your living room using the telephone....

Yes, things today are different -- but in another, far more important way: it is no longer US government policy to protect the monopoly of a single large telecommunications carrier (i.e., AT&T). Given the divestiture of AT&T and the radical changes in US telecommunications policy that have since led to wide-open competition in domestic telecommunications, I find it VERY hard to understand how the use of an amateur phone patch to avoid domestic toll charges could somehow be considered "illegal".

Of course, there are caveats here -- the communication has to be otherwise suitable for amateur radio transmission (no business use, no obscenity, etc) and it must be between points in the US; international third-party traffic rules still apply. But there is absolutely NO reason not to use your local autopatch merely because a cellular company *could* have carried your traffic.

Phil

3958. Re: airport security

Newsgroup: rec.ham-radio
Date: 1989-11-11 20:26:51 UTC
From: karn@ka9q.bellcore.com
Message-ID: <18190@bellcore.bellcore.com>
Source record: 15633

I'm a fairly frequent flyer, and I almost always have an HT (an Icom IC-32AT) in my carry-on briefcase.

My experience with US airport security has been VERY consistent. If I remember to disconnect the antenna from the radio, no problem. But if I leave the antenna on the radio, it looks sufficiently suspicious that the X-ray operator invariably asks about it. Usually they want to see it, but some times they'll ask "Is that a radio?" and they're satisfied with a verbal answer.

Things are quite different at non-US airports. I usually bury my HT (if I carry it at all) in my checked luggage. Cameras loaded with film are the real problem; even though ICAO member countries are required to provide hand inspection on request, I've had problems. In Montreal they made me take a picture of the floor to prove that my camera was "real". Most recently in Stockholm the cretin at the security checkpoint insisted that my camera go through the X-ray machine, even after a heated argument in which I mentioned the ICAO rule, took the lens off to show that nothing was hidden, and complained that my camera was loaded with high speed (ASA 1000) film.

I wonder if there's any place one can obtain some sort of official-looking document that describes the ICAO rule about hand-searching in as many languages as possible.

Phil

3959. Re: Where is the FCC when you need them? (long)

Newsgroup: rec.ham-radio
Date: 1989-11-12 00:58:07 UTC
From: tad@ssc.UUCP
Message-ID: <265@ssc.UUCP>
Source record: 15634

I thought that WA3JPY's use of military justice against a serviceman
who was bootlegging on the ham bands was really interesting and
creative.

He asked for examples of the FCC actually busting anyone, and I know
of a few.

Here in the Seattle area we have had a problem with fishermen using
2 mtr handhelds in Puget Sound. The local amateur auxillary FCC
folks (really ARRL Official Observers). The auxillary did some of
the footwork and this resulted in some arrests.

Also I know of a few unlicensed folks operating in this area who have
been busted.

The FCC is severely restricted by budget cutbacks. I think we can
blame this on the Reagan era cutbacks at ALL regulatory agencies, including
the FCC, bank regulation, SEC, etc, rather than bureaucratic lethargy.

73,
Tad

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

3961. Re: More on the RZ-1

Newsgroup: rec.ham-radio
Date: 1989-11-12 05:48:40 UTC
From: alan@km4ba.UUCP
Message-ID: <310@km4ba.UUCP>
Source record: 15635

Having owned & used the RZ-1 since april, I would say that I am pleased with the radio. There are some qualifiers, however:

1) This radio was never designed or intended to be a Communication quality SW receiver! It *is* however a convenient way to swl while riding around in the car. I have both a TS-440AT & the RZ-1 in my car..... given the poor preformance of my short antennas, I can tell little or no difference between it & the 440 rx. It is nice to be able to listen to foreign broadcast & TV.

2) It was never intended to be the "be all-do all" scanner! It is not a 1000 channel, turbo scan scanner nut box. It is a usefull, compact easy to use scanner for Pub. Serv., Ham, and (god forbid!) cellular. It does have most of the features of the best scanners, and a few they don't have.

As to the front end, I have used it next to Pro-2004's, and could tell little difference in sensitivity. So it uses a CATV front end! That means it is rugged,wide band, Voltage tuneing, and cheap. Makes sense to me! (sounds alot like an early Bearcat circuit) It is much more sensitive than my 721 mobile, when listening to pub service.

3) All the reviewers/commenteers were comparing it to radios costing much more, which did less. Yes it is a compromise, but it is a good one. It is ideal for mobile all purpose RX. Look at the size! DIN pkg. 2"x6"x7". Yet it replaced 2-3 cubic feet of equivilant gear in my car!

The radio has several attributes which attracted me to it:

1) It was compact. I got tired of having 47 radios in my front seat. I mainly used my hf rig for swl anyway (hf mobile got tiresome), and I did not want a full sized scanner installed for the same reason. I used to run it stacked under my 721 dual band. I am now going to replace my AM/FM with this and use an external amp. (Yes, it does do conventional FM stereo) If you have a jap car, there are installation kits in Japan which I/F it to your factory sound system.

2) The Alpha display feature more than offsets the slow scanning speed! IE: DEA CH1 is much better than 418.xxx. Broadcast band stations listed by country! ham repeaters by city & club. this should be on all radios.

3) It is handy to listen to TV while mobile. I even sometimes plug in a 9" CCTV monitor (12v even) and watch TV.

4) due to the bad reviews, it was priced aggressivily, with $50 of RS Pro scanners, and you got HF & alpha to boot! much cheaper than a cheap SW receiver and a scanner would have cost. Not much more than a good FM/cassette.

Bottom line: I like it enough that I am considering a second one for the shack, to set next to the TS-440 & the bearcat. it is just a handy radio.

Ya'll keep up the bad press, so I can get another good deal!
73,

Alan Barrow KM4BA

Out of curiosity, where do you draw the line between shortwave listening and espionage?

> Anyway... the question at hand, can the Clipperton be used on the WARC
> bands?

S 97.313 Transmitter power standards.

(a) An amateur station must use the minimum transmitter
power necessary to carry out the desired communications.
(b) No station may transmit with a transmitter power
exceeding 1.5 kW PEP. Until June 2, 1990, a station transmitting
emission A3E is exempt from this requirement provided the power
input (both RF and direct current) to the final amplifying stage
supplying RF power to the antenna feed line does not exceed 1 kW,
exclusive of power for heating the cathodes of vacuum tubes.
(c) No station may transmit with a transmitter power
exceeding 200 W PEP on:
(1) The 3.70-3.75 MHz, 7.10-7.15 MHz, 10.10-10.15 MHz and
21.1-21.2 MHz segments;
(2) The 28.1-28.5 MHz segment when the control operator is a
Novice or Technician operator; or
(3) The 7.050-7.075 MHz segment when the station is within
ITU Regions 1 or 3.

n is within
ITU Regions 1 or 3.

Yeah... me too. We had two hot air balloonists bootlegging on
220. With help from the amateur auxilary, FCC hit both with $750 fines.
We had a ham who was interfering on HF and VHF. FCC hit him with $1500
fine. Numerous out of band CB'ers (sidebanders) around here have
had unpleasant and expensive visits. A computer company that didn't meet
part 15 got hit. A CB linear manufacturer had a large find and lots
of amplifiers confiscated.

They're out there, folks!

>Vertical. I am interested in hearing from others using multiband
>vertical antennas. What is your opinion of there performance?

Buy it! In my opinion this is one great little (?) antenna. I purchased mine about 4 weeks ago, worked great with the mast bungied to the rail of my back porch and even better when I put it up on the roof of the house (chimney mount) about 30 feet up.

I worked the DX WW contest the first weekend it was up and can honestly say that in three days of operation I could count the number of stations I couldn't work on one hand. Basically, I found that if I could hear them I could work `em, given enough persistence.

10 Meters is basically flat across the band, and SWR on the others is more than acceptable.

I have ABSOLUTELY no complaints about this antenna, except the price, but even that is within the realm of reason. I'm planning to buy another for the QTH in VO0 land when I go up next summer.

BTW, at this time the R5 is the only HF antenna that I have, so if I were unhappy withit I'd surely know by now.

>Is the R5 design different from other verticals in some significant
>way as to eliminate the need for ground radials?

It does have radials... built in, that is. Their are 4 48" stainless steel radials at the base of the antenna, a matching network of some sort, sorry I didn't crack it open to check it out.

>How is the R4 different from the R5?

They have, I believe, added 17 meters which is by the way a blast! Buy the antenna, have fun but please don't work 17 meters, I want it all for myself!

>>pilchuck!prager@uunet.uu.net (David Prager) replied:
>>This is not an act of self-policing. This is vigilantism, maybe even
>>terrorism. Who are you anyway, some self appointed lord of harassment.

This is GREAT! I tried to tell a true story with some humor David and
your response left me rolling in the isles! Thanks! However, I think for
the non-hams that read this posting some clarification is in order. First
of all David I was (am) a control operator for the repeater that this gent
was using. As such when I suspect that a NON HAM is using that repeater
including autopatch, it is my RESPONSIBILITY to check it out. I did not
beat the guy over the head, I did not threaten him, I asked to see his
license. This is a rational request that any HAM would understand. I
noticed that you did not list your callsign David, are you a licensed
ham? However if your definition of a "Lord of Harassment" pertains to
a repeater control operator asking to see a hams ticket whose callsign
happens to not be listed in the Callbook, then yes... I am a Lord of
Harassment, especially to bootleggers which this gent turned out to be.
Do you support non licensed people using the amateur bands?

>>How would you respond if surrounded my men you had never met and
>>they demanded that you produce certain documents for their inspection.

If I was a HAM (which I am) in a area that I did not normally operate
from and 4 control operators from the repeater I was using asked to see
my Amateur Radio License (while at the same time presenting theirs, which
we did by the way) I would be PROUD to present it to them or to anyone
else that asked for it. To the best of my recollection the FCC wants you
to have it in your possession anyway when you operate. As a pilot of
General Aviation aircraft, I have been asked to present my pilots license
on two occasions. It was a pleasure to comply... I earned it, and I am
proud to show it off. PLUS, if this situation happened to me, I know that
it would embarrass the 4 gents talking to me TREMENDOUSLY if they questioned
that I was a HAM and then I pulled out an EXTRA CLASS TICKET! I'd get a real
kick out of that! Does that answer your question?

>>The (civil) police can't to this and I think the Attorney General's
>>office would think considerably less kindly about this act than
>>any transgression of the FCC's rules.

The police can't ask for your drivers license? OH REALLY? I'll have to remember that the next time I am caught speeding! Can I quote you? :-) Remember that driving a car on our highways is a privilege too!

If a HAM refuses to show his license to the control operator of a repeater, I do not think that he can then continue to demand to use that repeater, remember it is not just his ticket on the line here especially if he happens to be a BOOTLEGGER, which he was.

>>What if your kid comes home from school some day and a gang of his
>>alleged peers do this to him. How do react in that situation? Anger?
>>Rage? Violence?

We talked to his parents and asked if he had an Amateur Radio License. We also found out later that he was using a commercial handheld on the local fire department frequencies and was jamming them. He had been kicked out of the local volunteer fire department. I should clarify this. He had the radio, the fire department was experiencing jamming as soon as he was kicked out. We never could actually PROVE it was him, but after we nailed this jerk the jamming stopped. Draw your own conclusion.

If I had a son that used my amateur radio equipment illegally, his ass would remain red for weeks, but then I guess I'm not a "modern" parent! :-)

>>The bottom line is that Amateur Radio is a privilege, but it's
>>still just a regulated HOBBY.

True David, but that does not mean that you can use the hobby without a license and that we are powerless to stop those that do. In addition the final action was accomplished at a military level which I am afraid that you are not qualified to comment on, but if you are interested I will explain to you that under the UCMJ this man committed a FELONY. He got off lightly and very easily could have received a Court Martial.

>>PS I'd normally use a signature that includes my address. I'm
>> afraid if used you'll come around and check my yard for antennae.

If you don't have an Amateur License and you lived in my area, yes you are right.... I probably would!

For the past 4 days I have been picking up police transmissions on 42mHz from California. Pretty good skip, I would say, considering I am in Michigan. I have caught 18 different frequencies in the 42 mHz range from 10:00 am EST - 2:00 pm EST. The locations that have been given range from San Diego to Sacramento/Oakland/Berkeley. My question is - is the 42 mHz range a statewide Sheriff frequency for California? There have been no license designations given (i.e. KMG367, etc). Can anyone give me some information about this? I have been having a great time listing to these transmissions! I have a Bearcat 800XLT with an outside antenna.

I was quite touched to receive the following email from a new ham, and thought it was worth sharing with the rest of the world. (I have deleted the name, since I didn't get his permission to print this letter):

Dear Diana,

I want to thank you very much for creating the
hypercard stacks, they helped me allot to study for my exams. I study best when I can "hang" the information on something.

When I took the exam, I was so nervous that I forgot my street address. One of the questions asked me to draw a block diagram of a simple ham station, the supervisors were impressed.

I actually knew some theory to begin with. When I took your simulated exam I didn't pass, but after about 20 rounds I was progressing into the 70's-80's. I couldn't have done it without you!

Sincerely,
<name deleted>, N6WUR (Technician)

P.S. I am 13 years old.

CONGRATULATIONS are in order for another young HAM. Now if I can just get my 13 year old going on this....

It's been better than that. 6 meters (50 MHz) was wide open to Europe Wednesday through Saturday this past week (11/8-11/11), and yesterday, 11/12, the band was open to the west coast (W6/W7, but alas, no Alaska or Hawaii yet). Some solar flares this weekend seem to have taken the edge off, but look for good conditions to return no later than this same time next month.

I have never been hassled over my HT, but I was once refused permission to board an airplane in ATLANTA because I was hand carrying my tool kit. It is a typical kit, canvas bag and lots of screwdrivers. Xrays well and they opened it up to look at it. Then they told me carrying tools on an airplane was in violation of Federal Law and made me take it back to the ticket counter. I made the flight, but not by much. Of course I have a solution to problems like this, being as my job at that time required that I carry my tools when I travel, I merely told my employer that no matter what the additional cost, I would not travel using that airline again.

I guess they thought if I got bored on the flight, I would start dismantling the plane or something. "Lets see, if I take this bolt out I wonder if the wing will fall off." :-) :-) :-)

3980. mod for tm721A,731A (corrected version)

Newsgroup: rec.ham-radio
Date: 1989-11-13 14:29:25 UTC
From: rfc@briar.philips.com
Message-ID: <67971@philabs.Philips.Com>
Source record: 15654

copied from packet:
From: KA2YKC@KA2YKC
To: MODS@ALLBBS

The attached file is the corrected version of the KENWOOD TM-721A/731A expanded RX/TX frequency modification which has been circulated throughout the USA. I had tried the procedure previously and was unable to complete it with results. I got lucky and an anonymous source with pull at Kenwood USA was able to obtain the correct procedure for me, including a diagram!!!!!... I have tried the procedure on both a 721A and a 731A, and it works perfect.

**** DISCLAIMERs ****

The above information is intended to be distributed for overseas, military, government, and laboratory/experimental use only. I assume no responsibility for the results obtained by this modification.

P.S.> The repeater modification for the new TM-731A/631A rigs is identical and exactly the same as the procedure on the TM-721A/631A rigs.

73 and enjoy Eric ka2ykc @KA2YKC-4
(note: I haven't tried this, proceed at your own risk! WA2ISE)

<< KENWOOD TM-721A/731A EXPANDED RX/TX FREQUENCY COVERAGE MODIFICATION
------- ------- ---- -------- -- -- --------- -------- ------------

The following is the modification for the TM-721/731, which will allow TX/RX out of band, and allow tuneable windows from 100-200 MHz and 400 to 500 Mhz.

1 - Disassemble the radio as per the instructions in the cross band modification, so that you have the control panel exposed.

2 - On the board vertically mounted to the main chassis now exposed, locate R57 (TM-721A, R25 on TM-731A) towards the middle and bottom of this circuit board and remove. Be careful not to confuse this resistor with R58 (R26 on TM-731A) at the top of this board.

3 - Look on the board which is part of the front sub-chassis which is now free of the main unit, on the same side as the lithium battery, for a line of resistors, R110, R113, and R114. Between R113 and R114 is a pair of pads. They are SMT pads, so they are small and hard to identify.

4 - Connect a jumper across the pads. Be careful of this one because there is another conductor running between the opening of the pads. DO NOT SHORT !!

5 - There is another pad pair on the other side of R114, about one one inch and very close to the lithium battery. It has a blue surface mount resistor connecting it presently. Add a jumper here, thus shorting across the resistor. The first jumper is approximately 1 inch from the bottom of the board. The second is about one quarter of an inch from the bottom. This area is very sparse, and these resistors are all dead in line, and about slightly less that 1/2 inch apart.

It is strongly suggested that you do not attempt to do these mods unless you have the right equipment and skills. Also, the VCO has to be adjusted as per the service manual, and receiver allignment is also recommended for out of band operation above 460.000 Mhz.

**** For MARS/CAP frequency transmit enable only (142 - 152 Mhz), complete **** STEP 2 ONLY
---- - ----

Original procedure written by NZ2T, corrected by KA2YKC with help from an anonymous ham friend at Kenwood USA.

Wow, all the way into Michigan!? Well what you have been listening to is our California Highway Patrol (aka CHiPs). That's pretty good considering how far that is. Unfortunately, you won't be able to pick up the mobile units (but who knows?). They run extremely low power, so low in fact that I use an antenna up 40 feet plus a GaAs FET preamp to listen to them. I can get about 20-30 miles range.

As Bob Parnass can attest, the 800XLT is extremely sensitive. Usually in metropolitan areas this causes intermod and overload problems, but fortunately it's in advantage in your case.

If you're interested, send me email and I'll send you a list of frequencies along with their city/area designations.

3982. Re: A Contesters Viewpoint on QSLing

Newsgroup: rec.ham-radio
Date: 1989-11-13 16:23:13 UTC
From: wolff@cpoint.UUCP
Message-ID: <2820@cpoint.UUCP>
Source record: 15647

As the author of the K1EA contest program I figure I should finally post something. I share N2IC's problem and views on QSL'ing almost entirely. The cards come from the buro in 1 to 5 pound packages and I have stopped opening them because they are easier to store that way. What I HAVE done, in fairness to the many stations who want my card, is write a program that accepts K1EA .BIN files and produces QSL labels. The program keeps a MASTER.QSL file which contains all the band-calls from all the .BIN files ever run through the program. The first time a station works me on a band he gets a card, thereafter he never gets one again for that band. Up to four band contacts fit on a label to further reduce the number of cards sent. This algorithm results in about 50% fewer cards sent than 100% QSLing. Roughly 40% of the stations worked each year are new to the hobby. Callsigns seem to appear for 1 to 2 years then drop out. I try to reduce the QSL burden further by asking guest ops to use their own call. The net result is that of the 25,000 QSO's my station made last year I only had to send 4,000 cards, I didn't have to look at the incoming pile and everyone who wanted my card got one. My apologies to the stations who didn't want my card who got it.

If there is interest, I am willing to post comments on the design of my program (CT) and post the data structures so other people can fool with K1EA .BIN files.

The reason I haven't distributed sources to CT is that my family life can't tolerate any more phone calls. There are 400 registered users of CT who have manuals and roughly 2,000 unregistered users who don't. I have no objection borrowed copies, as long as I don't have to support them. A normal weekday evening results in 1 to 10 calls starting in the middle of dinner and continuing through my kids bedtime stories. I'm proud of my code, but it really wasn't written with the idea that dozens or hundreds of programmers of unknown experience would have a whirl. It really needs a full program specification and alot of internal comments before it could be unleased upon the world...

>
There was a mod. to minimize the 2nd harmonic. It consisted of
placing a series-tuned trap across the antenna terminals. It was
made by cutting the leads of a small value SM capacitor (I don't
remember the value) to a certain length. The assembly was installed
between the PA board and the heatsink.

> The higher harmonics were also right up there falling off with

This sounds pretty unusual. I'm tempted to say that some part(s)
is missing/broken in either the exciter section or PA section.
It's also possible that things are way out of tune.

> The design of the output filter looks somewhat cheesy... That is, the coils

>
Outside of doing the obvious things like checking all solder joints,
etc., and since you have access to a spectrum analyzer, look at the
excitation going into the PA. It should be relatively clean but not
perfect (the PA section adds additional filtering). If that
signal looks noisy, the problem is further back.

To amplify on Jim Reisert's comments, the 50 MHz band is now hitting its sunspot-maximum stride at last. Now that most European countries have joined the rest of the world in allowing hams on 6, we're seeing what a good place it is for the band. The Gs have been working Australia, Japan, and all over the middle east, Africa and South America, as well as much of North America. As stated, this past week has been especially good, the best day being Saturday. At last the openings didn't stop in the northern states, and we in the D.C. area had a chance. I picked up 7 new "countries" (GU, GI, OH, LA, F, SM, PA), as well as wokring a number of Gs. Other locals worked Senegal, etc, and of course the HCs have been in most days. Saturday the opening extended into Texas and even New Mexico (to Europe), and there was one Washington (state) to G contact.

Propagation is best when it is around mid-day at the path mid-point. In other words the US West Coast works Japan and VK in late afternoon PST.

ALL of this operation is using CW and SSB, and spreads over the 50.0 - 50.3 MHz region of the band, peaking 50.1 to 50.15 MHz.

Come join us on 6.
Bob, W3OTC
(BTW - Jim AD1C, I assume you are related to W1JR.)

3985. Re: airport security

I haven't had any problems so far taking my HT with me on domestic flights. Last week I went thru security 4 times without any hassle at all. In fact the security people didn't even ask any questions. At 3 of the checks I sent the HT thru the x-ray machine packed in my briefcase with my RS PRO-2004 scanner. The last time I handed the HT to the guard as I went thru the metal detector. He handed it back to me on the other side of the security checkpoint without a question. I have mixed feelings about this. After 8 security checks of my bags at various US airports not one has even questioned me about my HT or scanner. While I am happy not to be hassled, it makes me feel less confident about the quality of our security checks.

I used to own a 730 (before that, a 720, and after a year, I went back to a
720); As I Recall, the 730 uses several different vcos, one for each band.
If the vcos could be stretched out of band, then GC is a possibility. But
I doubt that's the case, and in any event, you'd have to reprogram the
cpu which controls the synth.

If you can deal with the rotary relay noise, go out and find a 720.

What difference, You're still transmitting a RF signal from an airplane, Using a downconverter(mixer, local osc, etc) inside the plane. What's the diffenence in my using a 1.2G handie or a two meter handy (other than then external antenna)??? The question was what am I missing in the technology difference? Are these planes modified somewhat? Are they using a particular group of frequencies which are guaranteed not to second (3,4,5) harmonic on a nav freq?

All the prevouis stated ideas (from the last year's news) put forth the propostion that the RADIO would effect the airplanes EQUIPMENT!!!. So where's the technology difference?? Enquiring minds want to know....

Speaking of scanners in catalogs...

Anyone else get the new EEB SWL catalog with a "soon to be available" scanner
in the back - supposedly to be imported by Heath - with a large LCD display
on which a *spectrum* is displayed? I know a spectrum analyser/monitor
would be great for sleuthing those military aircraft freqs and I wonder
if anyone has ever heardof/seen this scanner and whether the spectrum
display thing is any good.

I have a interesting story to relate about this subject.

On June 6th I was in a small car going to the Beijing airport [for
obvious reasons!]. We stopped at a traffic light, and up ahead at the
next light could see some small crowd of people. I happened to glance
to my left, and saw an old man, in the classic asian resting-squat
position, as you might see anywhere in China. Except, in this case, HE
WAS TALKING INTO AN HT, and looking toward the next intersection.

Needless to say, I got very excited and I scanned the crowd at the
next intersection, locating one man with another HT.

Apparently, the old guy was a lookout for police and military types, and
was reporting us in as just bunch of tourists, so we got waved through
without trouble.

The HT looked like a low-range 49Mhz type of thing, probably from Hong
Kong.(?)

A quarter-wave matching section has an input impedance equal to the
geometric mean of the section's charateristic impedance and the load.
As a vertical antenna has a feedpoint impedance half that of a dipole -
about 37 ohms, in other words - this section would provide an input
impedance of:

SQRT(37 x 72) = 52 ohms!

(And now we start to see that the characteristic impedances chosen for
"standard" cables weren't quite so random after all! :-))

]What did the Xray do to the film? Enquiring minds want to know...
]--
According to a friend of mine (can you guess where she works?), the xray
at the airports can take at least one years of the film's life out of it.
I had a similiar problem coming bakc from Germany. I had lot's of 1000 spd
film which was exposed, in my luggage., I didn't remember that they Xray that
too. I asked about my pictures and she pointed out to me that the film
has lost two years worth of life (ie if you bought film off the shelf that
was two years old, that's why professionals use a frigerator). When I
looked at the date, the two years would have put it out of date!!.
Anyway grainy pictures with not do great color... the faster the film
the more effect it has. She also said that it effects ALL film and if you
want to enlarge that 25spd film, you'll be very disappointed after the
trip past the security guard.

Rule # 1 let them check the film by hand

Rule # 2 It doesn't matter whether the film is exposed or not

Rule # 3 It effects all film

If I missed something feel free to note it, maybe I can get here to post
the real truth (providing it isn't a secret :-).

The CHP (California Highway Patrol) operate on a bunch of frequencies
in the 42 MHz area, throughout their operating regions in California.
I can post specifics if you'd like.

RTTY DX Notes for Weekending 10th November 1989
part 1 of 2
BID: RTDX1011

As this weekend is the W.A.E. RTTY DX Contest, we hope to see some good
DX and some new callsigns around the various bands. We wish that the
conditions will help us all to work many new countries. Well, i guess
that we can all hope.

We thank the following for their contributions to our DX notes this
week: DU1AUJ, G3XTL, I5FLN, JA1BLV, OD5NG, TG9VT, VK2EG, W1DA, W2JGR,
W5KSI, W6/G0AZT, W9CD, W0LHS, and others. Thanks for your help.

Thursday

ZK2RY 28088 at 0050Z
CU2EM 21086 at 0925Z
BZ1FB 14090 at 1935Z QSL

QSL Information.

9M8AX requests that his cards go to JA5DQH.

5W1VB cards go via OH3GZ, as do the cards for ZK2RY.

KD7P/NH2 cards go to Robert Winters, NCWP, MOU 3 Guam, P.O. Box 8265, Dededo, Guam 96912-8265.

5N0ALE says to QSL via DJ2VZ.

UA9MBM cards go to Box 71, Omsk USSR.

OX3XR will QSL via OZ3PZ.

YB8HX will QSL from Box 4, Makassar, 90001, Indonesia.

YN4JR collects his cards from Box 122, Jinotepe, Nicaragua.

BZ1FB says to QSL via Hugh Dean, 420 West Rose, Lebanon, Oregon 97355 U.S.A.

ZD7CW has a QSL manager who is N4CID.

Notes of Interest.

6W6JX has returned from holidays and is active with a new antenna system, making a big noise.

KD7P/NH2 and NY6M/NH2 will go to Midway Island (KH4) from the 23rd to the 30th of November, all mode operation, including RTTY after the CQ CW Contest. They would appreciate donations for the costs of the trip, and they may be sent to Robert Winters as per QSL QTH.

LY2BOK is a special call from Lithuania.

Raimo, ZK2RY, says that they will remain on Nuie Island until November 15th, then they will return to 5W1 for a short period.

UZ3DWH is running a robot station, not much different from the Commodore 64 type.

EA9JV reports that all is go for the (S0) Western Saraha trip from November 13th to 17th. He is expected to operate around 14090 KHz, plus or minus the dogpile.

Bouvet Island. One of the many groups due to attack Bouvet will include HB9CEP. His group will be there in February and will be the only ones to include RTTY. The other groups will only include white knuckle microphone holders and sore arm key thumpers. HI!

3998. How to get the Yaesu ft-411 into extended receive?

Newsgroup: rec.ham-radio
Date: 1989-11-14 00:05:53 UTC
From: spector@cmcl2.NYU.EDU
Message-ID: <43166@cmcl2.NYU.EDU>
Source record: 15665

I just got the Yaesu FT-411 and the FT-811; and I understand that at least the 411 cn be set into an extended receive mode.. is this possible without a hardware modification? Is there a way to enable this mode from the keypad? (like the APO and reset modes?)

Thanks in advance for any pointers..

Regards,
_DHMS, N2BCA
PS: In case anyone is curious as to why I got two separate radios as opposed to just buying a Yaesu FT-470 (the dual-band rig); there is a rather nasty microphonic feedback problem that happens on a bunch of frequencies in the FT-470 on both bands...

Source record: 15666

I've taken my handheld scanner through X-Ray (Uniden BC-100XLT) and have never been questioned. I was questioned about a Laerdal Portable Suction unit that I had, and was asked to show it (it's a medical suction unit I was taking for repairs, as I work for an ambulance company). At Sacramento Airport, I was also asked to place my pager (Motorola Bravo, little display pager) on the belt to be X-rayed. This thing is tiny, and I can't imagine anyone fitting a bomb into it (I can barely understand how Motorola gets a 900MHz receiver, LCD display, speaker, and vibrator in it! ;-).

Since I'm here, I'll post on my earlier message too... Regarding Missouri Radio Center, I received 3 email replies. One requested a followup, one requested the address, and another said that they had bought a Kenwood mobile from them and had good results. It looks like I'll be giving them a try for the Icom IC-U16 land-mobile handheld. I'm going to call Icom tomorrow and try to get a service manual for this radio. I'm hoping that they sell service manuals for their commerical stuff (and not just to commerical techs licensed by the FCC).

4000. Re: Spy numbers transmissions

Newsgroup: rec.ham-radio
Date: 1989-11-14 01:37:48 UTC
From: HAVANAMOON@cup.portal.com
Message-ID: <24033@cup.portal.com>
Source record: 15660
Cross-posted to: rec.ham-radio,sci.crypt,sci.electronics

"Spy Numbers Transmissions" are a shortwave oddity which have
been around for the last 25 years. They are commonly heard
in English, German, Spanish and the Slavic languages and take
the form of four and five digit groups of numbers which are
preceded by a three digit "identifier" and "group count".
They are generally broadcast by a mechanical-sounding female
voice, although Morse code (CW) "cut number" transmissions
are also frequently reported.

The who, where and why aspects of these transmissions are,
for the most part, unknown. Their mysterious nature has
resulted in their common characterization as 'spy' trans-
missions.

The spy theory has been enhanced over the years by the FCC's
inconsistent position in response to numerous inquiries by
the Shortwave Listening community.

If you've never heard a numbers transmission, tune your
radio to 11468 kHz any Saturday at 4pm EST (2100 UTC).
You'll almost certainly hear a 'classic' numbers transmission
which will run from 15-30 minutes. The signal from this
Saturday transmission is very powerful and can be heard
across the United States.

If you're interested in additional information, I've written
two books on the subject - "Uno, Dos, Cuatro: A Guide to the
Numbers Stations" and "Los Numeros: The Numbers Stations Guide"
both are available through Tiare Publications, Department P/U,
Box 493, Lake Geneva, WI 53147.

Numbers continue to fascinate the Shortwave Listening community.
There are a number of other publications which detail this topic
on a regular basis. If you'd like to know more, let me know.

4002. Getting mods from manufacturer

Newsgroup: rec.ham-radio
Date: 1989-11-14 01:43:30 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500280@ux1.cso.uiuc.edu>
Source record: 15668

The current policy of the radio manufacturers is to NOT give out mods info except to those with a MARS license. I would like to know why I need to have a MARS license to:

1. Expand my UHF radio to operate in 420-440 Mhz.

2. Expand a VHF or UHF radio for wide band operation so that I can drive a transverter and get full band coverage on a microwave band.

They cite two things to me when I ask for the info:

1. It is against FCC rules to sell radios that can transmit outside of ham bands.

2. The radios might be used on public service bands which is illegal since they are not type-accepted for it.

Number 1 is totally bogus. They could not cite FCC rules or any law, and said that someone from the FCC simply told them so, and could not name either the person or the office.

Number 2 applies just as much to someone with a MARS license since a MARS licensee cannot operate on public service bands (with a non-type-accepted radio) any more than other licensed hams can.

My point is that licensed hams DO HAVE LEGITIMATE needs and uses for modifying radios to transmit on frequencies other than what they are marketed for. This includes both expansion of full band coverage where the foreign radio makers failed to know and understand the American radio system and rules, as well as use in driving transverters.

To one manufacturer, when they told me that the mods would open up public service bands, I described how they could make their NEXT radio model so that it would NOT. The diode selectable bands are coded into the uCPU ROM memory, which simply can have things like 420-430 added, and make 430-440 NOT mutually exclusive with 440-450. Their response to my suggestion is that the radios are designed in Japan and they have no control over such things.

BALONEY AGAIN...

Maybe it is the case that NO ONE at the American offices communicates to people in Japan about design issues. Surely they must have at one time or we would not have even seen any 220 Mhz radios. But I do know that radios are coming out of Japan with incorrect or silly designs. For instance, 23cm radios have channeling in 10 khz incrments instead of the 25 khz standard the ARRL has establish in the USA. They CAN MAKE them with 25 khz because the European versions do it (time for yet

another diode surgery session).

What the manufacturers could do is this: when someone wants the info
for the mods, they write a letter to the manufacturer with the appropriate
documentation of what they need the mod for, and include a signed statement
that they understand the potential illegal uses of the radio and will not
be using it for such purposes. I see no reason why the manufactures have
to discriminate between different legitimate uses.

4003. SuperDF

Newsgroup: rec.ham-radio
Date: 1989-11-14 01:57:17 UTC
From: john@anasaz.UUCP
Message-ID: <898@anasaz.UUCP>
Source record: 15669

I have had a few email requests regarding how well the SuperDF worked out...

Well... I finished building the SuperDF kit Saturday in time to take it out for the evening transmitter hunt. Although we did most of our DF'ing with the doppler, the few times that the SuperDF was needed, it worked extremely well. We got snookered by a reflection, resulting in us being on the wrong side of a freeway, about 250 yards from the "T". We got out of the vehicle and fired up the SuperDF, and followed its bearings in a perfect straight line (taking bearings as we went) to the edge of the freeway. Across the freeway we could see a restaurant directly in line with the bearings.

Climbed back into the truck and drove to the restaurant. The doppler said the T was hidden in a thick hedge near the street corner by the restaurant. However, a quick on-foot survey didn't yield anything (it was a VERY thick hedge). Pulling out the (by now) trusty SuperDF, took a bearing next to the sidewalk that said the "T" was on a line parallel to the sidewalk about 4 feet in. Walked down the sidewalk until it said the signal was from straight into the hedge (about 20 feet from first bearing point). Sure enough, 4 feet into the hedge was an antenna and two well hidden operators.

The unit is as sensitive as the radio attached to it. It gives a very sharp indication of the bearing - you could probably read that indication to within a fraction of a degree (although other anisotropies would probably prevent the bearing from actually be that accurate).

The kit was of medium difficulty. The documentation is excellent, but the mechanical construction was a bit tricky (at least for one with 10 thumbs). The device quality is quite good, although I had to troubleshoot it because one 51K resistor turned out to measure at 900 ohms. However, the troubleshooting flow chart pointed out exactly where the problem was.

To forestall EMAIL queries, I'll give out the address here for queries. The unit can be purchased from

Cc:

I was wondering how much it cost you and if it would work with my radio.
I have a Santec ST-20T, and the pinout looks like this:

Plug 1 (Microphone): 3/32", combines PTT and audio lines (audio thru a cap).
Plug 2 (Speaker): 1/8" (That may be inaccurate, but it's the next size up), direct connection.
Both plugs are 2 leads only. I THINK it delivers its own power (I operate it off my PK-88 all the time). Could you let me know what you think? 73's,
****

I dislike posting this, but I've gotten enough responses from net users that it warrants posting.

A number of people have emailed me to request the Ham Stacks. I don't have any problem sending the diskettes out IF I KNOW WHERE TO SEND THEM. I've received a number of requests saying "please send me your stacks".... and no address. A few others have sent "please send the stacks to the address below".....and forget to provide a complete mailing address. The name of a University is NOT sufficient mailing address for USnail. What city? What state? What's the Zip code????

Might I suggest that net users change their .signature to include a valid mailing address? Just a suggestion. Meanwhile, I still have one request from the University of Illinois who will not be receiving any diskettes until an address is sent (hope he figures out who he is....:-). The one from University of Maine finally realized his mistake and sent the request again WITH an address.

Sorry to bother the net with this.

Noting months of continuing postings about carrying [insert favorite active electronic device] in aircraft, I think it useful to add to the traffic!

Over in Annapolis, MD, there is an organization called Aeronautical Radio, Inc. (ARINC), which is sort of a consortium of the major airlines in the radio/ communications field. Among other things, they have served as an anti-trust umbrella so that the airlines can get together and work out standard connector pinouts with theirs suppliers, etc. They also operate the HF communications which acts as the path between the air traffic controllers and transatlantic flights. I understand that they operate VHF nets for company traffic for some of the US airlines.

For many years ARINC (has) operated the electromagnetic compatibility center for the Department of Defense. This operation has a data base of spurious emmisions and sensitivities for all the military's gear.

It wouldn't take much imagination to think that ARINC would be involved is a xxxxx in a similar undertaking for the commercial air carriers, and would be a suitable place to determine that the airborne phones wouldn't interfere with the rest of the plane's vital electronics.

And then there was the Braniff flight I took back from Hawaii, where the HF SSB transmitter on the plane got into the PA system whenever the cabin staff was making announcements --- and when they stood too near a speaker and the PA oscillated the redaing-light pattern moved down the plane like a moving electric sign!!!

Diana,

Have you ever heard of a CALLBOOK? If not (and it's obvious you
haven't), let me tell you about it. By looking in the U.S. Callbook,
ANYONE having a U.S. amateur's call letters (assuming they are valid and
not too new), can find out the name and address that are listed on that
license.

What that means is that, by providing call letters, you HAVE
provided his name -- maybe not right now, but definitely when the Callbook
or Supplement containing it comes out.

Maybe you should get his permission.

4012. Microwave hops on localtalk network

Newsgroup: rec.ham-radio
Date: 1989-11-14 16:15:00 UTC
From: U009@CCIW.BITNET
Message-ID: <89Nov14.111810est.57392@ugw.utcs.utoronto.ca>
Source record: 15504

A co-worker recently remembered an article (with photograph) read in a computer related magazine 2 or 3 years ago. It dealt with a localtalk network with one or more of the hops handled by microwave links. The frequency could have been 3 or 10 GHz but the author specified that rather small dishes were required for 10 mile distances.

He suspects the installation is (was) on a university somewhere. Exhaustive search of various magazines (Dr Dobbs, etc) has not proved fruitful. Does anyone remember the article, better yet was anyone a participant? We would like to build up something similar.

Regards, Stu Beal, VE3MWM, (U009@CCIW.BITNET),
National Water Research Institute,
Burlington, Ontario, Canada.

> way as to eliminate the need for ground radials?
>
> How is the R4 different from the R5?

The Vertical HF Antenna, generally, refers to a quarter wave vertical
antenna. This antenna requires ground plane radials to `mirror' the
vertical (as far as field dynamics) so that it looks like a half wave
dipole antenna. The R3, R4 and R5 verticals are half wave vertical
antennas. These half wave verticals do not require a counterpoise to
to `mirror' the vertical since the antenna is already resonant. However,
two design considerations: The half wave is too big, so they do have
saome inherent loading due to the traps that shorten the antenna; And,
an end fed half wave (voltage fed) are VERY sensitive to interference
of it's field (and thus it's impedance)by conductive objects near by, thus
requires a small decoupling counterpois. It is tricky to end feed a half wave,
but cushcraft has managed to do it, I praise them for being able to do it on
a mass produced product.

The R3 was a three band version 10, 15 and 20M. R4 added 12M I think, and
the R5 added the other WARC band for a total coverage of 10/12/15/17/20 Meter
bands. The reports on this antenna are VERY good (I don't own one .. yet)
but not as good as available 5/8 Wave antennas (which by no means provide the
bands the R# series have) but often provide surprising better results than
some HF beam antennas !!!

> system and rules, as well as use in driving transverters.

If a company fails to understand the needs of a market, you need not buy
their product. Or, more constructively, you might tell them what to do.
The key is to talk directly to the people who design the product.

> Their response to my
> suggestion is that the radios are designed in Japan and they have no
> control over such things.
> ...
> Maybe it is the case that NO ONE at the American offices communicates to
> people in Japan about design issues.

Quite likely. Those Japanese companies may not even listen to retailers
in Japan. Same thing goes for your favorite brand washing machine. How
much input you give to your sales rep actually makes it back up to the
design board? I believe it is much more effective to write to the company
design team direct, rather than complain to a local office.

> What the manufacturers could do is this: when someone wants the info
> for the mods, they write a letter to the manufacturer with the appropriate
> documentation of what they need the mod for, and include a signed statement
> that they understand the potential illegal uses of the radio and will not
> be using it for such purposes. I see no reason why the manufactures have
> to discriminate between different legitimate uses.

There is a marketing issue here concerning liablity which you may not
be aware about. I will not go into the details here - suffice it to say
at this moment that your attitude may well be shrugged off as perfectly
sound yet so naive that it is senseless for the manufacturer to produce
a new product line or release modification info.

I would suggest that you contact the head offices of the companies you
are dissatisfied with, and let them know of the various radio practices
you feel they do not understand. They tend to have staff that understand
English.

From: lcz@dptspd.sat.datapoint.com
Message-ID: <208@dptspd.sat.datapoint.com>
Source record: 15490

My Kenwood TS-430S will not receive anything below 150 KHZ. There is a definite, sharp, cutoff at that frequency. Does anyone know how to change this? I realize that performance may be less than great, but I would like to at least give it a try.

Thanks!

Ditto the '32AT, tho I have a Armadillo nylon case I'm fond of... :-) I imagine I've paid Mr. Crandall's mortgage payment more than once (if he has one!). Anyhow, I frequent the EWR <--> DFW <---> TUL route.

>My experience with US airport security has been VERY consistent. If I
>remember to disconnect the antenna from the radio, no problem. But if I
>leave the antenna on the radio, it looks sufficiently suspicious that the
>X-ray operator invariably asks about it. Usually they want to see it, but
>some times they'll ask "Is that a radio?" and they're satisfied with a
>verbal answer.
>

Hmmm. Hadn't made the connection (no pun intended!) as to antenna being on or off. I may check this. To bolster ones confidence on the topic of airport security, I'll share my "true story":

I recently made my trip - but last time it was a little different. A good friend had asked me if I could take a look at an extension phone he had in his garage. Fine. After I packed my bags, I realized I'd forgotten the tools. Having the room in my 'dillo bag and NOT in my suitcase, I threw the following goodies into my carry on - among other things:

In addition to the '32AT, I had:

Butt-in test set (with amp & memories, etc.- outta look good on the x-ray, no?!), a Progressive Electronics 77M tone tracer & line aid (inductive amp / "sniffer" for the tone tracer - more electronics), a Fluke 87 DVM (Oh boy!), Paladin automatic strippers, about 25' of Teflon station cable, cable spudger, cable connectors, misc screwdrivers, etc; etc.

Well, I hadn't given this much thought until I walked down the long red carpet corridor at Newark. Then it hit me! I thought:"Omigod! I'm gonna miss my plane while I wait for a manager to show up and interrogate me...". Boy was I wrong! I kept my mouth shut, flung the bag on the conveyer, walked through the detector (with plastic handled-metal bladed flip knife, {thanks Apple!} in pocket). The gal watched the monitor - as I did - DIDN'T SAY A WORD. I'm not trained in operation of that hardware, but based on what I saw on the screen, I might've at least wanted a closer look!

As a test, leaving Tulsa (I knew I'd get to the airport early), I decided to leave the tools in my carry on. I was stopped immediately at the x-ray deal.

The gal opened the bag looked at most of the items, and said:"Oh, you do field service?" I said:"Yeah, something like that!". "Oh okay..." and asked me for a business card (either to substaintiate my "story" in case anything "happened" {in the air}, or else she liked me - in either case she never called! :-)).

While neither event slowed me down enough to cause any real aggravation, and that's good, it does make me wonder if terrorists and other hombres need to go through the hassle of stuffing the PE inside of cassette player or ghetto blaster (or "Third World Briefcase" as I once heard them called!).

>Things are quite different at non-US airports. I usually bury my HT (if I
>carry it at all) in my checked luggage. Cameras loaded with film are the

Dunt know about that, Phil, I haven't left the US of A in YEARS!

(rest of stuff deleted)

4023. 1st Experience with Cushcraft R5 (works great but have TVI/RFI)

Newsgroup: rec.ham-radio
Date: 1989-11-14 22:04:36 UTC
From: forrest@sybase.com
Message-ID: <7071@sybase.sybase.com>
Source record: 15497

I recently decided to bite the bullet after many years of fooling around with vertical antennas with radials. So, I bought a Cushcraft R5. I first checked around the mailorder places for the best price. The range was from $239 to $259. The funny thing was almost everybody was out of stock. I instead bought one from a local Ham Radio Outlet store which had a whole bunch. They only charged $249.

I assembled the antenna without any problems except they had forgotten to put two minor parts in the box. I was able to assemble the antenna without them. The construction looks well done and all the metal looked like stainless steel. I was carefull to measure the spacing between the various sections carefully. Although the instructions weren't the step by step kind you'll find in Heathkits, they were good enough to put the antenna together.

I put the antenna on a standard 10' Radio Shack steel mast and attached some new Belden RG/8 to the antenna. Since my rig is a solid-state Icom IC-730 I first wanted to check the SWR to make sure I wouldn't be transmitting on too high an SWR. Much to my pleasure, the SWR was just about what they claimed it would be in the instructions.

Since there was a JA contest going on last weekend I was able to try out the antenna on some DX right away. I was able to work every JA I heard. Since they always give a 5x9 report I really couldn't tell how well I was doing. Then I heard a KH3 on Johnston Island who was causing a big pileup. There were many very loud stations calling him. Much to my amazement, after giving him several calls, he came back to me. He only gave me a 5x5 but the fact that he heard me at all with all those big signals made me feel very good.

Then came the bad news. My father-in-law, who lives next door, called to tell me I was getting into his TV. The strange thing was I wasn't interfering with the picture, only the sound. Also strange was the fact that he could still hear me even with the TV turned off. (It turned out that his TV is one of those TV's that are never actually turned off unless they are unplugged in order to keep the picture tube warmed up). He was also able to hear me on his telephone. I tried my TV and heard nothing but I could hear myself on my stereo. I didn't try my phone. I should add that I have the negative side of my power supply connected through some heavy copper wire to a 4' ground rod.

The next working day I called Cushcraft to ask for the missing parts. They right away agreed to send them to me without the slightest hassle. I also described my interference problems to the person I was talking

to. He said they've heard that before and that the low angle of radiation of the R5 sometimes causes problems. He recommended that I raise the antenna and also use filters on the TV and phone, something that I will do when I get a chance.

So, to summarize, I'm quite happy with the antenna but concerned about my interference problems. I'd be glad to hear from anyone who might have some advice on how to solve the interference problem.

Anything you read here is my opinion and in no way represents Sybase, Inc.

Aircraft radios are tested and approved by the FAA. One of the tests is
to insure that it does not interfere with other equipment aboard the
aircraft. Your cellphone or ham HT doesn't have this testing and
approval.

>the reputation of being the "station you can pick up on your toaster". We are
>causing QRM to everything in sight. The Kappa Sigma fraternity house on campus
>objects to us being heard on their phone lines. We have to keep the 3000watts

Phones are not designed to act like shortwave (or FM BC) receivers, and
when they do, there is something wrong with the phones and/or the phone
lines. Contact the phone company and ride herd on them until they put
filters on all the lines. They are required to do this.

>to keep our advertisers, though. How can I cut down on front-end loading,
>without cutting power, or installing filters on every blessed thing on campus?
>Any ideas?

Beg borrow or steal a spectrum analyser that goes up to at least 1 GHz,
and check out the purity of your signal. If there is a problem, use
standard troubleshooting techniques to find and correct it. Make sure
all your antenna connections are good and tight, with no corrosion
anyplace. Make sure you aren't overdriving any amplifier stages in your
transmitter. Make sure your exciter is clean. (That spectrum analyser
will come in handy here also.) After that, the only thing you can do is
look into another site for your transmitter.

In the rare case that original ideas Kenneth J. Hendrickson N8DGN
are found here, I am responsible. Owen W328, E. Lansing, MI 48825

4026. To QSL, or not to QSL?

Newsgroup: rec.ham-radio
Date: 1989-11-15 00:48:02 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <13.Nov.89.18
Source record: 15491

Question: Why do hams insist on QSLing? OK if you're trying for WAS or
something, fine. Go ahead, send off your QSL card.
But for every QSO with somebody just down the road?
I've been asked for QSLs when working through a repeater!
If i want to write to people, I would join a pen-pals society.
I dont QSL. I make it obvious during QSOs that this is the case.
Keeping the postal service in profit doesnt turn me on.
I dont participate in contests or go in for awards, but accept that
some hams do and have nothing against them for it.
Thought: If you have a video camera, scanner, or a fax, you
could digitise your QSL card, capture it on your PC or whatever, and send
the file to someone using packet, then they print it out on their
machine. Would this be a valid QSL card?
'Sorry OM, no QSL - my printer is not PostScript compatible'.
(could open up interesting possibilities though...)
Or would they then ask you for a QSL card to confirm your packet QSO?

> Rule # 1 let them check the film by hand

DEMAND that they check the film by hand. Refuse to pass until they do.
If you encounter trouble in a foreign country, by all means let EVERYONE
know about it and name the country.

> Rule # 2 It doesn't matter whether the film is exposed or not

But, X-ray exposure does not affect the film the same as leaving it on the
shelf. The effect varies according to how well the film is shielded. The
best shield, unfortunately, is one that can also hide a gun.

> Rule # 3 It effects all film

It effects already processed film much less, though.
One alternative is to process the film before leaving the foreign country.
In Europe, either use a PROFESSIONAL film processor that knows about the
appropriate C-41 or E-6 processing, OR use a European film such as Agfa,
which is still using their own processing chemsitry. In Japan, you are
probably best off using Fuji or other Japanese film as the processing there
is sure to best match that film as opposed to Kodak.

Rule # 4 Never mail unprocessed film home or to a USA lab as it can get
X-rayed that way as well.

There are no American manufacturers of a full line of VHF and UHF HT's
and mobile rigs. Your suggestion rules out Japanese imports. Like I
said in my posting, I do suggest to them what to do, but they just rebut
with the excuse that the radios are designed in Japan. I guess I need
to call Japan.

While I am disappointed there are no American manufacturers making the ham
equipment of this type (Ten-Tec, are you listening, really?), I am not
against buying from Japan except for the apparent ignorance of the American
market on the part of the Japan designers, which may well be a result of
shielding by the American offices who are primarily concerned with marketing
issues rather than innovative solutions to problems non-existant in Japan.

I guess I need to call the local office and ask them this. I did that
yesterday as a matter of fact for one company, and I could get no further
than the head of marketing who said it would do no good. I will try one
more time and refuse to explain to them WHY I want to talk to Japan, in hopes
that they won't "try" to deal with it locally. If I get the numbers and
addresses, I will post them on the newsgroup.

> There is a marketing issue here concerning liablity which you may not

They have plenty of oppurtunity to tell me this, and have only mentioned that
their concern is being accused of selling non-type-accepted radios into the
public service, land mobile, or maritime markets. The concern is valid, but
they still recognize a legitimate need for the mods regardless, and fail to
recognize other legitimate needs; I call that discrimination.

I could make an issue that since they refuse to give out the info to a limited number of people who understand the type acceptance problem, they are effectively encouraging a "black market" of mods information that is in fact bigger, and lets less legally concerned individuals, including non-hams, have a radio that is operable on public service, land mobile, and maritime bands. If I wanted to make waves, I could do this, but I will restrain myself.

> I would suggest that you contact the head offices of the companies you

4030. Six Metre Band Opening to JA

Newsgroup: rec.ham-radio
Date: 1989-11-15 02:00:36 UTC
From: grogers@Janus.MtRoyal.AB.CA
Message-ID: <891114190058.094@Janus.MtRoyal.AB.CA>
Source record: 15508

For all hams who are (or WILL BE) 6m ops: the promised band openings off-continent has started! I logged 8 Japanese QSOs on or about 50.125 from 12-Nov-89 2333Z to 13-Nov-89 0009Z. If you are one of those who dusts off the 6m rig from 1-Apr until 1-Sep - better RE-DUST! The upswing is with us.

For info's sake, I run an Icon IC-575A at 10w PEP out into a 4-el YAGI at about 10m (about 30 feet if you have average-sized feet).

The sigs hit a peak at about S9.

Good dx!

4031. doppler vs. superDF

Newsgroup: rec.ham-radio
Date: 1989-11-15 03:10:37 UTC
From: john@anasaz.UUCP
Message-ID: <901@anasaz.UUCP>
Source record: 15500

I got an email from someone at NCAR but lost the mail before I
had a chance to reply, so I'm doing it here.

The question was essentially why I use both a doppler and a super-DF,
and which is best.

The doppler has the following advantages:
(1) it has no moving parts. This means that one person can drive
a vehicle and read the doppler at the same time. The SuperDF
requires you to rotate it to determine the bearing. I suppose
you could fix mount it on the car and rotate the car, but that's
a bit awkward also!
(2) it can take bearings on short signals such as a ker-chunk.

The SuperDF has other advantages:
(1) it is portable. It can be used on foot.
(2) It gives very accurate bearings.
(3) It works with weaker signals than available dopplers
can process (although in theory the doppler should
be better at this).
(4) It costs less.

4032. SuperDF Principle of Operation

Newsgroup: rec.ham-radio
Date: 1989-11-15 04:34:41 UTC
From: john@anasaz.UUCP
Message-ID: <902@anasaz.UUCP>
Source record: 15492

Sorry to keep posting about the SuperDF, but I just got two email
requests to post the principles of operation of the SuperDF.

The unit has two identical dipoles, which are alternately connected
to an FM receiver through switching diodes. If the antennas are at
equal distance from the source (ie the bearing to the source is
perpendicular to the line between the antennas), essentially
nothing happens to the signal when the antennas are switched. However,
when one antenna is closer than the other, a positive phase shift
is generated when switching to one antenna, and a negative when
switching to the other. When this phase modulated signal is
fed to an FM receiver, it results in positive or negative
pulses, somewhat delayed from the time of switching. The SuperDF
uses a synchronous detector (essentially a switch between the
signal and the signal inverted) to convert the pulses to the
same polarity, then uses a narrow sampling window to grab the
peak of each pulse, which is then applied to a filter. The output
of the filter is a signal whose polarity depends on which antenna
is closer to the signal (thus resolving the 180 degree bearing
ambiguity you would expect from two antennas), and whose amplitude
is non-linearly related to how far off center the bearing is.
The polarity of this signal is used to either driver LED's or
a variable frequency oscillator. These are used by the operator
to determine which way (if any) to turn the antenna.

[PS to KA6S - yes, it is similar to the Double Ducky, but is a
much improved design. The trick you mentioned may work, but the
filter is very narrow, giving either a 10Hz or a 1Hz bandwidth,
which makes it pretty tough!]

Phil (ka9wgn) asks for the addresses of the big three Japanese ham radio companies. I didn't know that you couldn't find that out here in the U.S. ... not that I ever paid notice.

Here they are:

Kenwood
Shionogi Building, 2-17-5 Shibuya, Shibuya-ku, Tokyo 150, Japan

Yaesu
1-20-2 Maruko, Ota-ku, Tokyo 146, Japan

Icom
6-9-16 Kamihigashi, Hirano-ku, Osaka-shi, Osaka 547, Japan

If you need others, such as Alinco, Uniden, Standard, Azden, and so on, let me know, and I will supply you with the info.

But both systems are ARBITRARY. Neither is really better than the other.
I really cannot see that a system based on the distance from the North
Pole to the Equator passing through Paris (based on an incorrect survey)
and various properties of water is any more logical than one based on
the average length of a man's foot.
It is about time that all these units were swept away and replaced by a
logically consistent set based on universal physical constants such as
the velocity of light in vacuo, Planck's and Boltzmann's constants and
the universal gravitational constant.
The much-vaunted "consistency" of SI only comes about by giving some
quantities fictitious dimensions divorced from physical reality. B and H
should logically have the same dimensions (which they do in cgs units)
as should D and E. A thoroughly confusing situation.

Why am I interested ? Because it is one part of the hobby (the hobby being radio in general) that I enjoy. There are many people who enjoy scanning the mil aircraft band or the FBI or the CIA or the DEA etc. If you were to do this professionally for some government agency you would be known as a "spook". Ther are MANY amateur spooks as can be exemplified by Pop Comm and Monitoring Times Mag. If you watch any of the "utility" columns you will see this type of information (mil callsigns, frequencies, etc) published on a regular basis. There have been many books published on this and other spook subjects. What do you think this "havana moon" stuff is all about ?? Their area of spooking is the number stations. The bottom line is.... LIGHTEN UP ! No one is betraying the security of the United States. It's all just another part of this facinating hobby. You should give it a try. You never know when you will hear a flight of F-16's practicing in a Military Operating Area (MOA) or couple of ANG A-10s refueling.

In article <1022@unsvax.NEVADA.EDU> storkus@arrakis.nevada.edu (Mike Storke) writes:
> I was wondering how much it cost you and if it would work with my radio.

Hi Mike + Net ...

The headset lists for around $57.00 from Kenwood. Unfortunately, it looks like EVERYBODY sells such accessories at list price, with no discounts to be find - when it comes to hand/speaker mics, headsets, PL boards, etc. it is REALLY worth waiting for your next hamfest.

As far as what radio it will work on ... this is an interesting question, that I've fought with several times hooking packet TNC's up to various handhelds. For the kenwood 215 and 25 series HT's, there is a separate PTT line. It is from this line that the vox unit in the HMC-2 is powered. It is probably not worth modifying and building connectors for this headset to work on your radio ... you would be better off with one that uses the same PTT scheme (of the radio sensing the presence or lack of the microphone element itself upon PTT) as yours does. I think that the IC-2AT's use that scheme, and the older Yaesu's, don't they?

Furthermore, if you were to buy an ICOM model instead of the Kenwood, you would get the "traditional" earphone style, rather than the separate ear plug arrangement that is attatched to the HMC-2.

I am curious ... does anybody know why manufacturers would go to the trouble to have the microphone-in-line PTT system, instead of just a wire that goes to the switch and gets grounded when you push it? It sure seems like a lot more work to build the radio that way. I'm glad most of them don't do that any more.

Wait a minute! The Air Force transmissions are deliberately sent unscrambled because we have an agreement with the Russians that normal traffic will be sent unscrambled so that each side can tell that there is nothing nefarious afoot.

Are you telling me that it is OK for the Russians to listen to SAC, but NOT OK for Americans to listen to SAC?

When I was a kid, we had the Communications Act of 1934, which said I could listen to ANYTHING, so long as I didn't use it for commercial gain. I'm certainly not going to trust YOU to decide what I can listen to!

4050. More Heathkit/Standard

Newsgroup: rec.ham-radio
Date: 1989-11-16 03:39:16 UTC
From: skoh@aludra.usc.edu
Message-ID: <6518@merlin.usc.edu>
Source record: 15517
Cross-posted to: rec.ham-radio,sci.electronics

Hello again,

Since I have been getting a large amount of mail asking for more information
regarding my recent post about a friends HeathKit radio, I thought that
I would post the info. over the net, so here it goes:

The unit is a Heathkit HWS-24-HT and, from what he understands, it
is made by Standard radio (model C500) in Tokyo Japan and imported
to be sold/distributed here by HeathKit.

The unit is only sold fully assembled (as it comes from Japan), and
receives from 130-170Mhz and from 418-470Mhz. It stores 20 memory
channels.

What my friend is looking for is any advice or information that might
be passed along to him (i.e. do's and don't for the radio); also
he has heard that the radio can me modified for more memory and for
the MARS/CAP frequencies.

He has requested a service manual for the radio, but since it is
new, Standard says that it will be some months before one is out;
so if ANYONE has any information about the unit please send it to
me and I will pass it along.

Thank you,
skoh@aludra.usc.edu

>You might be interested that my boss, who takes domestic flights quite
>frequently, ALWAYS makes outgoing calls on his RS portable cellular phone
>WHILE AIRBORNE.. and continues to do so, since to my knowledge he has never
>been hassled.

I was on an America West flight just yesterday where a guy was using
his cellular phone while we were sitting on the taxiway. I pointed out
the prohibition in the safety manual in the back of the seat to the
flight attendent and she shut him down.

Maybe most people don't know about the hazard but that's no reason not
to educate the people you come in contact with.

If you guys don't think Japanese manufacturers listen to U.S. hams,
talk to Chip Margelli, K7JA at Yaesu.

Yaesu is so interested in feedback from American hams that they
assembled a board of hams of varying background to help them in
picking features for new radios. A guy from this area, WW7Q is
on that committee.

Regarding the statement that the telephone company is required to get the radio interference out of your phones, this is not quite true.

Since the MFJ breaking up AT&T, most LECs (local exchange carriers) have not been in the business of supplying phones, or even inside wire. They just supply dialtone up to the "point of demarcation" (often the "protector" on the side of your house.

If your inside wire is picking up RF and your phones are rectifying and detecting it, this is probably YOUR responsibility.

So in the case of the campus FM station, if the transmitter is clean, then the RFI responsibility falls to the owner of the affected phones, or the private company that they have contracted with to maintain their inside wire and phone gear.

I have an AOR AR-900 and we can say that the thing is less than perfect.
Mind you, it does a good job and has lots of features. Here is a list
of complaints. I think that this scanner was designed quickly or not tested
very well.

-- pauses when scanning locked out channels. If I am scanning bank A and have
channels 11-20 locked out, the scanner gets to 10 and then pauses a while
before going back to 1. It may take the same amount of time to scan a bank no matter how
many channels you're actually looking at.

-- sometimes the delay doesn't work right. It will keep going right after the
carrier drops. And sometimes it delays several seconds. It's unpredictable.

-- On mine, memory channel A1 (first one in bank A) doesn't work as well as
others. i.e. if I have the same freq. in 2 memories, it will skip A1 but
catch the other. If I open the squelch more, it will catch either.

-- Fairly picky about squelch. Sometimes a memory will click as it's scanning.
This means that there is a station on that channel but the squelch didn't open.
If you open the squelch more, it will stop.

-- The audio is very quiet. Without mods, you cannot put it on your belt
outside and expect to hear what's going on.

But, there are many nice features. 5 sets of upper and lower band scan limits
instead of 1 set like most radios. 800 MHz, of course. It does a good job
and isn't too expensive, but is not always as predicatble as it should be.

I've got a Regency HX2000E Scanner (I think the 'E' designates it as a
'European' model) coverage 60-89, 118-174 and 406-512MHz.
It is troubled by two serious symptoms::
1) In-band spurii, particularly in the 60-89MHz band, so strong as to open the
squelch and stop scanning.
2) Synthesizer whine accompanied by a 'wobbly' spurious, that creeps
HF to LF for about 10 minutes after switch-on. I think that this is
the LCD Display multiplexing oscillator, as it stops when i disconnect
the display power feed.

I have taken the thing to pieces and made sure that the shielding cover of
the microprocessor/display is adequately soldered to the PCB, also added
a number of 1nF decouplers at what look obvious places (power supply feed to
synthesizer, across battery terminals, across the tuning-voltage-to-frontend
feeds) and this has made a slight improvement. Anyone else got one of these
beasties and cured the noise? Or should i start putting ferrite beads on all
the non-RF wiring?

4058. 42 millihertz (mHz)

Newsgroup: rec.ham-radio
Date: 1989-11-16 14:58:20 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <8911161458.AA06225@cmr.ncsl.nist.gov>
Source record: 15540

***** Mounting Soapbox *****
Where do you get a receiver for 42 millihertz (mHz) ? I didn't know that
one could achieve enough bandwidth there for useful communication. etc. etc.
***** Dismounting *****

Seriously, there are good reasons to use correct abreviations for units, and
mHz is an example. Though the poster likely MEANT MHz (megahertz), the
posting specifically SAID something the poster DIDN'T MEAN.

Universally accepted multiplier prefixes for units are:

Factor Prefix Symbol Example
10**12 tera T THz
10**9 giga G 1 GHz (1000 MHz)
10**6 mega M MHz
10**3 kilo k kHz
10**2 hecto h hg 100 grams
10**1 deca da dam (decameter)
10**-1 deci d dl deciliter
10**-2 centi c cm centimeter (re)
10**-3 milli m mm millimeter
10**-6 micro u (l.c. Greek mu) uF microfarad
10**-9 nano n nH nanohenry
10**-12 pico p pF picofarad
10**-15 femto f fW femtowatt (FM rcvr sens)
10**-18 atto a am attometer

You will note that multipliers of a million and greater have capital-letter
symbols. The common computer K multiplier is an unoffical
indicator for 2**10 times. M and G are used loosely in the computer world
to mean 2**20 and 2**30.

As for the units themselves, the ordinary rule is that the spelled-out
name of the unit is NOT capitalized. The abreviation is capitalized ONLY
IF THE UNIT IS NAMED FOR A PERSON.
W James Watt s second
H Joseph Henry S Siemens
Hz Heinrich Hertz F Mike Faraday
V Volta A Ampere
m meter g gram
t tonne (1 Mg, 1000 kg) K (Lord) Kelvin
As best I can tell, there aren't standard abreviations for bit, baud, & byte.
I'd like to see b, Bd, and by - but then, who cares what I'd like.

Bob W3OTC

4061. Emergency Communications

Newsgroup: rec.ham-radio
Date: 1989-11-16 15:46:52 UTC
From: AXVSCCN@UICVMC.BITNET
Message-ID: <8911170806.AA23165@ucbvax.Berkeley.EDU>
Source record: 15544

John has made some interesting points about his bad experiences with hams in emergency communications. I feel the biggest problem is the lack of dedication of most hams to serve their communities. Most hams I've met refuse to accept formal training. My personal experience comes from SKYWARN training. The attitude I run into is..."when we're needed we'll be there"..."but don't call us before that". Many feel that working a 2-3 hour shift at the yearly homecoming parade clears them of any further "community service". I put on an intensive SKYWARN training program this past January. It covered weather, communications, safety..etc. The only hams that showed up were those who were directly affiliated with our local emergency services agencies. Where were the rest? With the "me have license...me communicator" attitude that so many hams have it's no wonder that many emergency officials refuse to deal with them. My suggestion is that hams re-evaluate their traditional thinking about emergencies and start concentrating on more useful aspects --namely tactical traffic. It *is* just a matter of time before we see more VHF frequencies dissappear. Simply licensing more hams (greater numbers) will not provide the voice we need to maintain our ground. We need to prove our usefulness on a daily basis --not just when the big one hits. ...Chris...

Source record: 15557

PJML@IBMA.NERC-WALLINGFORD.AC.UK ("Pete Lucas writes:

>Question: Why do hams insist on QSLing? etc. etc

I enjoy sending and receiving QSL cards. I don't collect stacks of them
but I always QSL when requested and I enjoy a QSL from a good friend that
I meet over the air. A conversation can be forgotten over a year or so but
I always find it enjoyable to "go through the stack" and be pleasantly
reminded of an old friend. It's kinda like looking through an old photo
album... it's nostalgic. My reason for getting on the air isn't simply
to "add to the stack". I enjoy meeting people over the waves.
I'm not a "5-9 QSL" conversationalist.

I don't usually QSL to "locals" unless I run into them repeatedly and
set up a schedule or the like.

("old fart" talk coming...)

Yes, I have been licensed for 21 years. I have lost contact with many
of the high school era friends I met "back then" but I can still
browse through the stack and remember the 10 meter nets on an otherwise
dead SSB band that we had weekly. I recall when someone on "one of those
damned cards" used to suggest to go out, at a spur of the moment and grab
a pizza or go to the local school and whack a tennis ball around. I still
can look at the QSL card from my first contact (Okinawa on 40 CW). I still
can look at the same for my second contact (WA6EYN, who later became a real
good friend of mine, he lived about 5 miles away). I can still look at
the card from the person that got me interested in ham radio (WN6DNA).
Do we have the same satisfaction getting on a repeater on 2 meters? Most
likely, the answer is "no".

We really had a lot of fun on the air and were on daily.

I also look at cards from more recent contacts with the similar pleasure.

VHF as we know it didn't seem very interesting then. I have never QSLed
or received a QSL from a VHF contact. Maybe that's why QSLing is on the
decline. There are a lot of people hanging out on two meters. 'A lot of
mobile "I'm 10 minutes from home, do you need anything at the store"
conversations and nets where people say their call letters to one another
without much else to say.

Believe it or not, we even had CW nets in high school and ENJOYED it!

There wasn't as much grumping then, with a greater number of operators
on the band.

QSL cards are a great tradition of amateur radio.

It was (and is) just another fraternal aspect of the hobby.
I hope that aspect isn't obsolete.

Yes, Marlon Brando's call was under his real name (which I don't remember
at the moment) and if I also remember correctly, he let his US license
expire when he retired cause he settled down in Tahiti. He fell in love
with the island during the filming of "Mutiny on the Bounty" and also held
a ham license from there for many years. Actually a better solution might
be to look in the INTERNATIONAL volume of the CALL BOOK cause I don't
imagine there are all that many hams in Tahiti. As a matter of fact I think
I will when I get home today.

There have been a number of messages looking for information on getting licensed to operate on vacation outside of the U.S. (I guess the cold weather is starting!). The ARRL has everything you need to know about obtaining a license, and will send you (free of charge! no SASE or green stamp!) the info and forms for most countries. Call 203-666-1541 and ask for information on reciprocal licensing. Yes, you actually have to resort to copper wire, and actual human intercourse.

Your reception at customs in the incoming country will vary quite a bit. It helps a lot to have a ham from the host country meet you at the airport. Jim Talens N3JT wrote a good article for QST on this topic, somewhere around the Fall of 1988.

>have the original old paper written by the man himself but I
>was looking for someone who might have done this in software
>such as DSP code for one of the DSP's or even C for that matter.
>-Charlie Thompson

I've found that the Costas loop is not very good compared to some later developments. It was also impossible to convert to a digital form (as hardware counters, multipliers, etc.) Get the book Phaselock Techniques by Floyd M. Gardner and read chapter 11. It presents several evolved forms, such as the Early-Late gate and the Transition Tracking Loop that are superior in performance than the Costas loop, are hybrid digital/analog designs, and can trace their functional for back to the Costas loop.

I've personally designed an all digital version of the Transition Tracking Loop and it was an order of magnetude less complexity than an all digital version of the Costas loop would be. Admittadly, this has nothing to do with DSP or C code, but if an all digital hardware solution is obvious from the theory and simpler to design, I would think a software solution would be obvious and computationally less expensive.

I have the specs on the MPH Industries K-55 radar gun. It is by far the most commonly used unit by police departments. The output power is less than 100 milliwatts. I beleive that you don't have to be lisenced to use under 100 mW. To the best of my knowledge police are not lisenced. With regard to the legalities of jamming: FCC regs permit the reieving of any frequency, but specifically forbid use of the airwaves for illegal purposes. The subject of jamming has been heavily discussed on rec.autos and jamming would fall under state laws of "obstructing an officer in the performance of his duties, etc." Radar detectors are pretty much cut and dried legal(except in D.C., Conn., and maybe Maryland) since they are just recievers.

Take a look at "A New Chip For Charging Gelled-Electrolyte Batteries,"
by Warren Dion, N1BBH, in QST, pp 26-29, June 1987. I have used the
circuit described to maintain a charge on a 6.5 Ahr gel cell for my
VHF & UHF HTs for about a year and a half -- works fine. Charging
current is from either a wall transformer or a 5W solar panel.

I agree. When I bought the FT727R with the first version of firmware, I was dissatisfied with a lot of the little firmware program quirks. I fed them back to the small ham dealer who sold me the radio, and she passed them on to Chip. A number of the changes did make it into the second firmware version, and (aside from the size of the radio) I was a happy FT727R owner (who has since upgraded to the FT470).

With fly-by-wire technology coming to commercial aviation, I am
getting particularly nervous about EMI from ANY electronics...

I knew someone who worked on these systems; based on some of the
stories he told me, it would make me a little nervous to even turn
on the overhead light...

re: carrying on HT's - I've been flying round trips at least twice a
month lately, in addition to my normal 4 times a year or so. In the
last 4 years, They've only looked in my briefcase to see the HT a
couple of times, but never wanted it turned on or questioned about
my license or intended use. I've never been checked when the antenna
is removed. Surprises me they aren't more curious. Also see lots of
cellular phones carried on, but never any warning...

> * Via ProDoor 3.1R
Of course both (or rather, ALL) systems are arbitrary. That includes systems
based on physical constants, if we ever get any such systems, because you
would have to choose WHICH of the many constants are to be considered the
fundamental units and which the derived units!

But I think you missed my earlier point. The merit of the SI system does
not lie in how the meter was originally chosen. Some fraction of the circum-
ference of the earth is no better than the length of King Henry's foot, nor
is the length of a meter more or less "convenient" than the length of a foot.

Instead, the reason the SI system is superior is that it is a complete and
coherent system. It is the only such system, though cgs comes fairly close.
If you read Dutch, I have an excellent reference I can point to for a more
detailed discussion ... :-)

As for why Planck's constant etc. aren't used to define units, that's very
simple: they cannot be measured with the same accuracy as the things that ARE

being used to define units. When that changes, the definitions may change too. This has already happened in one case mentioned: the speed of light in vacuo IS now used to define the meter. But it wasn't when the definition came up for review in 1960, since c could not then be measured accurately enough
to compete with the Krypton lamp. By 1983 this has changed, so the definition of the meter changed.

From: Havana_-_Moon@cup.portal.com
Message-ID: <24157@cup.portal.com>
Source record: 15554
Cross-posted to: rec.ham-radio,sci.crypt,sci.electronics

In his article, neal@lynx.uucp (Neal Woodall) writes:

>You are somewhat correct, but I can clarify what you
>have posted....

Neal gives good information. He references the source as Popular Communications Magazine - with some very few exceptions - the "Numbers" articles published in Popular Communications have been mine. I offer the following to further elaborate on a subject which has fascinated me for much longer than I care to acknowledge.

As Neal notes, some few numbers transmission sites have been identified, most notably in Warrenton and Reming-ton, Virginia and Miami, Florida. Also, live (non-computer generated) 5-digit Spanish transmissions have been traced to a site in the vicinity of the Galapagos Islands.

A new - and totally amazing - site has very recently been identi-fied with the aid of extremely sophisticated RDF (Radio Direction Finding) equipment. Specific information about this location will be published in the December edition of the Umbra et Lux Newsletter. Further, the purpose and suspect-ed identities of those responsible for SOME forms of numbers transmissions will be detailed in the January edition of UeL.

(UeL is available for the asking and a #10 SASE sent to DX/SWL Press, 10606-8 Camino Ruiz, Department UKK#, Suite 174, San Diego, CA 92126)

Regarding what appears to be a widespread belief that these numbers are to be decoded using a one-time pad or derivative, it is curious to note that in many cases, the same 5 digit group repeats 3-4 times in a single crypt.

Additionally, these messages are often repeated from week to week, and in some cases from month to month. It has been noted that the tapes are repeated so often that tape breaks sometimes occur, and when spliced back together, one digit of a group will have been spliced out, resulting in a not uncommon situation where a four digit group will be found mixed in with the other five-digit groups!

It would therefore appear that much of this traffic is 'phantom' or 'dummy' in nature, or without any real meaning other than to keep a frequency open over a long period of time.

The majority of 5-digit Spanish transmissions are badly overmodulated. The end result is extreme signal distortion and numerous spurs up and down frequency. Spurs can often be heard from 15-25 kHz on either side of the carrier frequency. Even with the NRD-525's narrow filter, this anomaly is often observed.

So it appears that while the individuals responsible are very skilled at maintaining their anonymity, their technical abilities leave much to be desired. It's worth noting that this same technical ineptitude is NOT noted in 4-Digit Spanish or English transmissions.

Assuming that these transmissions are of some importance, it would behoove those responsible to endeavor to 'clean up their act.' They are often so badly distorted that it is extremely difficult to copy an entire crypt without numerous errors. As an example, the numbers 'sies' and 'siete' are almost indistinguishable when broadcast under such conditions.

Readers should be aware that there is probably no SINGLE explanation for these curious transmissions. Several distinctly different numbers transmission formats have been studied and identified and the findings published - ("Uno, Dos Cuatro: A Guide To The Numbers Stations, Havana Moon, Tiare Publications, 1987. ISBN 0-936653-06-X.)

Unfortunately, the sheer volume and global implications of this unceasingly fascinating topic have conspired to prohibit all but the most very basic research into the subject. Oh, for enough time and money . . .

By way of interest - it has been reported that German submarines during WWII received weather information by way of 5-digit German numbers transmissions. Any further information in this regard would be greatly appreciated.

4089. Hams in disasters

Newsgroup: rec.ham-radio
Date: 1989-11-17 20:45:29 UTC
From: herbster@b11.ingr.com
Message-ID: <6620@b11.ingr.com>
Source record: 15571

It was November 15 at about 1600 CST here in northern Alabama when the big storm moved in. I checked into the local NWS net that took over the .94 machine on 2m. Lots of hams making very efficient reports of hail, lightning, etc. Then at about 1630, the NATIONAL GUARD at the old airport in Huntsville reported a tornado on the ground at the golf course. The net control op asked this guy for HIS CALLSIGN! Precious time wasted till a REAL ham confirmed this as cars were airborne in front of him.

To make a long story short, we (the hams) had a beautiful comm network, lots of mobiles and information pouring in.....but the net was not plugged into anything important. Lots of info and nowhere to send it. The police would not let hams near the area at all. These same individuals were ASKED to report to a staging point by the local EOC for the purpose of crowd control and putting a portable radio with each group of volunteer rubble searching parties. The only way we found to be useful was to drop the HTs in the car, pick up a shovel and start digging. When it became appearent that the EOC was not able to get to the on-site people and coordinate, the repeater became swamped H/W traffic. Fortunately, KB4CRG came on and volunteered his machine (with operating patch) and himself to offload the H/W stuff (at least someone was helpful). The point here is not to berate the hams in this effort. Goodness knows the effort, will, and response was there. But for some reason the local police and city officials REFUSED to make use of it when it was obvious they were in over their heads. WE were organized, WE were capable, WE had practiced, but for some reason, the whole thing was handled rather poorly (IMHO). What is a group to do??

From: goldstein@delni.enet.dec.com
Message-ID: <6210@shlump.nac.dec.com>
Source record: 15565

This came up in comp.dcom.telecom a few months ago, though it was
mentioned here.

If you're an AM station, then anything that'll rectify will pick
you up. Nothing you can do about it. That's the nature of AM.

BUT since I think you're an FM station, you should nominally have
zero "AM component" on your signal. That means if you feed it
into a diode you get DC, not recovered audio. Obviously it's not
working that way!

The problem is sometimes caused "synchronous AM", if I recall.
It's caused by mis-tuning the FM transmitter. If the final amplifier
stage is peaked too tightly, then when there's audio, its amplitude
will vary a bit, causing AM to be generated. You get MORE power out
this way, but it causes this type of interference and usually means
you're putting out more power than the FCC intended your transmitter to
put out. (The efficiency goes up beyond the rated value!)

The fix is to retune the transmitter according to spec. It may take
a bit of manufacturer's help but one hopes the instructions are
adequate. If that doesn't do it, call the transmitter manufacturer.

(1) For the weather reporting, get with the NWS Skywarn program. They
should provide training to the hams (yes... in this case, as John DeArmond
said, the hams need to be able to do more than communicate). Then,
you can feed weather reports to them and be believed!

(2) As far as local authorities, there is no way to force yourself on
them. However, now might be a good time to talk to them - they will
no doubt be reviewing all of their disaster planning after this event.

Note that not all of these windows will have sarex operation in them.
These are only possible windows. The US will have very few passes which occur
within these windows. On the other hand, Japan, S. America, Australia, and
S. Africa will have good coverage.

* STS-35 NEWS *

Astro-1 power-up testing was completed on the morning of 08-Nov-89, and the
HDRR functional test was successfully completed. IPS power on retests were
made two weeks ago. After testing, the decision was made not to change out
the HDRR-TU.

* NEW ASTRONAUT/HAM! *

There is an excellent chance of another "ham-in-space" Space Shuttle mission
shortly after Ron's mission in April. Ken Cameron, a Pilot scheduled to fly
on STS-37, has recently passed his Amateur Radio license exam, and has been
issued the callsign KA5EWP. His success in obtaining a license is a result
of the Johnson Space Center Amateur Radio Club's efforts to promote Amateur
Radio, especially among its astronauts. NASA Headquarters approval for KA5EWP
to operate an Amateur station on STS-37 has been received following submission
of a joint ARRL/AMSAT letter. Ken's operations may include an FSTV uplink and
SSTV downlink.

* SHUTTLE NEWS *

The launch date for STS-33 and the Space Shuttle DISCOVERY is being evaluated,
but will not be any earlier than 22-Nov-89.

* MIR NEWS *

High levels of solar activity caused Mir cosmonauts Alexander Viktorenko and
Alexander Serebrov to flee from Mir and take shelter in the Salyut-7 space
station. Salyut-7 has higher radiation shielding than does Mir.

These high solar radiation levels were the cause of the IHU upsets on
OSCAR-13.

* GALILEO NEWS *
---
14 November 1989

The first course change maneuver for Galileo was successfully completed on
11-Nov-89. The two day maneuver began on 09-Nov-89 at a distance of 28,200,000
miles from Earth, and consisted of a long series of time pulses of Galileo's
2.2 pound thrusters. A shorter continuous period of firing would have
overheated the thrusters.

The total speed change was 38 mph which will move Galileo closer to its target point near Venus, but changes the arrival time to Venus on February 9th by only a few minutes.

During the maneuver, a temperature sensor on one of the thrusters failed. However, in the future the temperature of that thruster can be deduced from nearby thruster readings.

Galileo is now 55,162,000 miles from Earth and traveling at 60,807 mph. After gaining momentum from Venus's gravity, Galileo will return to Earth in December next year, use Earth's gravity to loop out to the asteroid belt, and return back to Earth again two years later for a final gravity push to reach Jupiter in December 1995.

I thought I saw this posted recently, but many are asking, so here goes....

in the book, _BIGGER SECRETS_, William Poundstone reveals:

Dave Ingram, columnist for CQ magazine, has spoken with a ham in
French Polynesia, callsign: FO8GJ - callbook: Martin Brandeaux.

This may be Marlon's real name, or a French adaptation of his stage name,
in deference to where he resides. Brando lives on Tetiaroa; he bought
the island from a British heiress in 1966.
Beam Heading: 241 from the East Coast;
about 209 from the West Coast.

mailing address: c/o Radio Club of Tahiti, BP 5006 Pirae, Tahiti, French
Polynesia. Poundstone reports that a polite inquiry sent to this address
"brought no reply."

.....that's all I know.

>----------

* For general interest, you can write to the ARRL and get info
on whatever country you wish to operate in and they will tell
you what they know about it.

* The agreement between the US and Canada is unique -- there is
no hassle at all, you just start operating, using the appropriate
call sign protocol (which I forget, but is probably your call/VE6, etc.)

* MEXICO: There is a reciprocol operating agreement with Mexico
which means that you don't have to take a test to get a license
if you have a valid US ham license. However, you cannot simply
go into the country and start operating. The procedure seems to vary
a little depending on exactly where you go in Mexico, but it
goes something like this: You have to go to Mexico, get your
Tourist Visa/Card which you need to get across the border
(regardless of any radio activity). Then you spend about 1/2
day doing the legwork of obtaining the license. (This info, by
the way, was supplied by some US hams living in the Guymas/San
Carlos area.) This has to be done at the Mexico equivalent of
the FCC, which means that you will need to go to a relatively
large city. I believe a sidetrip to another government agency
is required to actually pay the license fee. Yes, there is a
license fee, I seem to recall that it is equivalent to $20 or
$30 US. The license/call sign is issued right on the spot and
you get an XE call sign. (Many of the XE's you hear on the air
are US folks who live/vacation down there.)

I thought this was all a good deal and I wanted to get an Mexican
license until I found out that it is only good for 6 months.
After 6 months, you get to do it all over again. So my conclusion
was that you have to want to operate pretty badly to spend 1/2

day doing the legwork on a vacation and its only good for that trip (unless you go back within 6 months).

Some of the folks who live close to the border (like in So. Calif.) may be able to make the scheme work a little better.

Before this gets too far... Military communications in the "clear" are not as sensitive as you all have been so quick to point out. As a matter of fact, if you can put the callsign with the unit, then find the units address, you will get a QSL card confirming your reception. You have to include a lot of information though. Stuff like: "I heard you, send me a card" get thrown out. Stuff that contains a signal report, and quality, etc, get a response. Most of the callsigns refered to were static callsigns - assigned to specific units. They are published, and public domain. You just have to know where to look. Tactical callsigns however are almost never confirmed. As an avid radio listener myself, both SWL and Amateur, I can appreciate someone having a hobby that includes listening to military aviation and fixed base. As an OpSec (Operational Security) tool, reception reports are handy for analysis. As a political statement - I personally feel that first they take your radios, then they take your guns. I would rather they forced secure communication on the Cellular Lobby, than ban radios. The ECPA was forced on Congress by an active PAC and the public didn't seem to care. If you were worried about your election, how would you vote?

4104. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-11-19 09:42:57 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8911200802.AA10274@ucbvax.Berkeley.EDU>
Source record: 15427

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

* cs.utexas.edu!asuvax!stjhmc!f1.n234.z1.fidonet.org!Jim.Grubs
* @tut.cis.ohio-state.edu (Jim Grubs) replies:
* ....and the fact you're eavesdropping on things not intended for you is
* irrelevant, right?

Just another persons 2 cents thrown in... Yes Jim it is irrelevant! Most of the Communications Act of 1934 still applies in this country, thankfully!

I, like you wondered why this gent wanted the information he asked for but it really didn't concern me. Tactical callsigns are "official use only" but are not classified per se. "Air Force One" is a callsign, are you upset that people know about it? :-)

Odds are that if he writes a letter to the military public relations officer that he suspects belongs to the unit, he will receive an answer and probably a confirmation.

But the point is, I see nothing wrong with listening in on unencoded transmissions and trying to figure out what you are listening to. Do you have a general coverage HF receiver? Have you ever listened to anything (other than broadcast) in those segments of the bands? Have you ever copied AP or Reuters news broadcasts on RTTY or SITOR transmissions around 8 MHz? None of these transmissions were "meant for you".

Believe me, if our military doesn't want you to hear what they are saying ... you won't! If they broadcast "in the clear" then they are not worried about what anyone hears... why should you be?

4106. Cross-Field Antennas

Newsgroup: rec.ham-radio
Date: 1989-11-19 19:19:06 UTC
From: kchen@Apple.COM
Message-ID: <36635@apple.Apple.COM>
Source record: 15430

For those of you who have been trying to get more info on Cross
Field Antennas, there is a 3-page article in the November 1989
issue of "Electronics World & Wireless World," by a C. Bryan Wells.

In the article, the author gives the dimensions and photographs
of an experimental x-field antenna (aerial, sorry :-) and the matching
networks he used. I quote one paragraph:

I cannot claim that the CFA is as efficient as a
full-size wire dipole, although it is only very
slightly down on a 40m twin lead dipole, also up
in the roof space, which I have used as a reference.

But then, the entire antenna is 70cm high and 20cm wide, using coffee
cans (coffee-tins, sorry :-) as the main material source.

On a different matter: how does one directly measure the radiation
resistance (not the antenna impedance, unless it is 100% efficient :-)
of an antenna? Can it be done? Any ideas, anyone?

4107. Talking Out your Ears

Newsgroup: rec.ham-radio
Date: 1989-11-19 19:20:36 UTC
From: cep4478@ultb.UUCP
Message-ID: <1635@ultb.UUCP>
Source record: 15440

[27 megahertz] (bug? where are you?)

DAK (Drew Kaplan, "The Guy with the Neatest Job in the Whole World") Industries has reduced the price of the all-in-the-ear 49mhz FM communicators. It's now under $40.00.

I wish I had the money to experiment with it. I'm hoping that this posting might inspire someone to try? It's an FM intercom, which says that the VOX unit would be appropriate for hookup to an HT, and I'm sure that impedance matching the microphone and the earphone isn't too hard.

I'm not sure of the audio quality of this in-the-ear microphone thing. (Have seen some rec.ham-radio comments about it, a long time ago). Doesn't seem like it'd sound too good when you "talked out your ear".

RTTY DX Notes for Week Ending 17th November 1989.
BID: RTDX1711
Part 1 of 2.

Due to equipment malfunction, we regret that there may be some slight
delay in the delivery of these DX notes this week. But with the help of
my good friend TG9VT, we will get them to you by whatever means
possible. We hope for better things next week.

Our thanks this week go to G3XTL, G0ABI, I5FLN, JA1BLV, OD5NG, OH2LU,
TG9VT, VK2EG, W1DA and many others. Thanks chaps for your interest and
help.

QSL Information:

HK0BKX says to QSL via the callbook address, which in my old book says WB9NUL.

TU2BB will QSL via N2HOS.

UQ1GWW reports that his QSL address is Box 618, Riga 226001 USSR.

A9KQ QSL address is Box 21, Melilla, Spain.

EA9JV, when at home, or if he signs S0/EA9JV, will QSL via Box 100, Melilla, Spain.

S0RASD will QSL via EA2JG.

J6LB cards go to Box 1328, Castries, St. Lucia.

9K2KA will QSL via Box 30, Safat, 13001, Kuwait.

GU0/KD7TT appears to QSL via 6 Rue de Douzaine, St Peter Port, Guernsey, U.K.

Notes of Interest:

S92LB appeared for the first time after Walter's operation, with SM0AGD at the keys. Hope that gives Luiz a little incentive for more operation.

PW2A is a special call for Brazil during the contest.

It is expected that GU0/KD7TT will be on Guernsey for about three years.
Walvis Bay now has a new prefix of ZS9.
There is some doubt about the call of ZA1ST/OH2BM, as the wrong name was given for the OH2BM station. We are checking to ascertain the validity of this operation.

It seems that the Bouvet Island operations have all agreed to carry RTTY operations. Now that's nice. The Norwegian group will start around December 23rd for a 25 day stay. They will have antennas first on one side of the mountains, and then for the second half of the operation they will be shifted to the other side, thereby giving everyone a fair signal, we hope. Later the W9 group will also operate RTTY with W9CEP as the RTTY operator, but that will be in February.

Anyone who has not received a QSL card for the VU7JX operation should apply to J. Srinivasan, 340, 5th Main, 2nd Cross, First Block, Koramangala, Bangalore, 360034. India. Strange address, but the mail does get thru.

GL DE DX1 (VK2SG) via TG9VT.

]are kits of this available ? have you any experience using the superDF for
Yes - mine was
]maritime mobile operation. I've been looking for a cheap way to use amateur
^^^no
]vhf repeaters for line of position fixes while sailing.

You might be able to use this for what you wanted. The only problem would
be any multipath from metal on the sailboat which might bias the bearings
a bit. Should be at least as accurate as a doppler, more sensitive,
and has a simpler antenna.

NOTE: I've gotten a lot of email about the SuperDF. I have had poor luck
in responding (our mailer is not too smart). A couple of comments:

(1) SuperDF has been around for a number of years.
(2) It is sold as a kit or assembled.
(3) I have no interest in it other than that I have one, and that I know
Russ Andrews, the creator of it.
(4) In theory, a doppler system can be as sensitive and accurate as
the SuperDF. In practive, I haven't seen one that is either.

**** UoSAT-OSCAR-11 BULLETIN - 205 17th November 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

*** UoSAT-D & E LAUNCH ADVANCED! ***

In a surprise move this week, the launch of the UoSAT-D & E spacecraft and the Microsats has been brought forward to 09 January 1990 - due to problems with the SUPERBIRD satellite that was scheduled for launch in mid-December. UoSAT-D & E are now undergoing pre-flight preparations before being shipped (with the launch integration team) to Paris on 30 Nov and then Kourou on 01 Dec in readiness for mating to the ASAP on 12 Dec.

UoSAT-D & E have ccmpleted RF tests in the screen room at UoS and have been exposed to low temperature tests in the Clean Room 'freezer'at -20 C. Marc Fouquet, designer of the CCD camera on-board UoSAT-E, has been taking 'bench-mark' images for comparison with orbital images. Totally 'black' images have been collected to provide data for image processing using the Transputer Data Processing Experiment - also on UoSAT-E in collaboration with the European Space Agency. The additional solar simulation tests planned for next week have had to be cancelled due to the advance in departure date, and the spacecraft are now undergoing final cleaning and assembly in the Clean Room. Uplink & downlink calibrations in an RF anechoic chamber are planned for next week - providing that the chamber can be made available within the very tight schedule. Numerous visitors from several countries (as well as the UK) have

recently come to UoS to view the new UoSAT spacecraft.

** Phase III-D **

AMSAT-DL announced that they have received substantial funding for the Phase III-D satellite which, as outlined by DJ4ZC's paper presented at the 1988 AMSAT-UK Colloquium, will depart quite radically from its predecessors -- it is designed to have an RF output of 250 W, will weigh 200 to 400 kg and will be placed in a high-altitude Molniya orbit, similar to OSCAR-13.

** OSCAR-13 OPERATING SCHEDULE **

MODE B MA 060 to MA 160 NOTE: MODE S Operation will
MODE JL MA 160 to MA 195 return Nov. 23rd after
MODE B Beacon MA 195 to MA 200 the next AO-13 attitude
MODE B MA 200 to MA 240 re-adjustment.
OFF MA 240 to MA 060

** AMSAT OSCAR-10 Status Report **

Please DO NOT USE the Mode B transponder on AO-10 until 20-Nov-89 since AO-10 does not have sufficient solar illumination to support the general use of the Mode-B transponder at this time.

*** Thanks for Reports ***

Thanks to all those who have sent in reports and telemetry from the last days of UO-9. Dave Guimont, Jr. WB6LLO still holds the record with telemetry at 05:15 UTC (13 October). Can anyone do better?

Reports received this week from:-

Angus Newman, G6CSG

Wrong! For example, ALL messages on AUTODIN are encrypted for the express purpose of denying any potential adversary the knowledge that any messages are more imprtant than the others.

> Are you telling me that it is OK for the Russians to listen to SAC, but
> NOT OK
> for Americans to listen to SAC?

It's not OK for either.

> could
> listen to ANYTHING, so long as I didn't use it for commercial gain. I'm
> certainly not going to trust YOU to decide what I can listen to!

You interpretation of the Communications Act is erroneous. The ECPA became necessary because electronic Peeping Toms abused the privacy portions of the CommAct.

You shouldn't have to trust me. I'm not involved. It's the message sender's right to say "This is none of your business." This right is protected by the constitution and laws of the United States.

It's true the public owns the spectrum, but then the public also owns the highways. That doesn't give you any rights with regard to anyone else's car or its contents.

Hmm ...

The callsign server says the following ... N2JGW (me) was
issued on April 25, 1989. N2JGQ was issued on August 1, 1989.
Q comes *BEFORE* W (explain this one?) and, furthermore, I am quite
certain that there are more than five callsigns issued between August
and April, in 2-land.

Just a curiosity...no nastygrams, please.

Chris N2JGW

(I tried mail, but it got caught in a forwarding loop between andy.bgsu.edu and saqqara.cis.ohio-state.edu.)

Jim, chill out. Have you heard of the legal concept of "reasonable expectation of privacy"? If not, it says that one's privacy may be protected (e.g., against eavesdropping without a warrant) ONLY when the circumstances are such that the speaker had a reasonable expectation of privacy in the first place. For example, if you discuss a drug deal in the middle of Grand Central Station and somebody overhears your conversation, he is entirely within his rights to report the conversation to the police.

It is only the public's ignorance of the nature of radio communications that allowed the ECPA to come into being. Common sense should tell you that unencrypted radio communications have no greater "reasonable expectation of privacy" than a conversation in the middle of Grand Central Station. Less, in fact, since at least in the latter situation you can look around to see if anybody is nearby.

While I'm not disputing the interpretations of the laws as we have them today, I do feel that these things do not need to be, and indeed SHOULD NOT BE as they are in a free society we think of ourselves as having (but actually do not because of the paranoia of politicians). Although it is not the case in 1934, it *IS* the case that today we have scrambling and cryptographic systems so thorough that privacy and secrecy can almost be assured by their use. The military knows these things VERY well, and implements it. These systems are good enough that there should be NO NEED for an ECPA.

I will extend your analogy about the car on the highway a little to explain what I mean. If I leave my car unattended on the highway and locked, I should not expect someone to be rummaging around in its contents. If on the other hand I empty its contents on the side of the road and leave those unattended, I can full well expect someone to rummage through it, take what they want, and if they are really cruel, substitute items so that when I return to collect my things, I will have been given something I may not want. These two scenarios apply to ENCRYPTED and OPEN radio communications where the waves pass by my legal place of being. This is my opinion.

He who does not encrypt is foolish (except hams).
Cellular phone users are foolish, too.
The ECPA is a farce.
This is all my opinion.

4118. Ham Radio programs for the MacIntosh computer

Newsgroup: rec.ham-radio
Date: 1989-11-20 12:48:32 UTC
From: dls@genrad.com
Message-ID: <28984@genrad.UUCP>
Source record: 15446

I have received many requests for info concerning some of the Ham Radio
programs I have. So here's what I have:

Four Stacks for practicing for the Ham Tests:
Novice Ham Stack
Technician Ham Stack
General Ham Stack
Advanced Ham Stack
from Diana L. Syriac
49A Meadow Pond Drive, Leominster, Mass 01453
These are public domain.

MacMorse
Shareware from David A. Kall
#314, 700 Marine Parkway
New Port Richey, Florida 34652
(sorry, I don't remember how much, but it's about $20 and you
get a worthwhile manual with it)

A number of shareware or public domain:
Hurrican Tracker
Satellite Locator
Convert 1.0
MacSat
MacMorse
Ohm 1.0
Pad Design
Red Ryder/Packet
KA9Q Terminal Internet Protocal Packet
Electronic Fonts
LCS
Digisim2.0
EEnotes
PackitIII
etc, etc, etc.
from Kinetic Designs
PO Box 1646
Orange Pk, Florida 32067-1646
$4.00 a diskette

Hope this helps!

From: WMLBTAM at UCCCVM1
To: INFO-HAMS at WSMR-SIMTEL20.ARMY.MIL
subj: Pointer to archives re: NiCd zapping?

SOMEWHERE about a year ago SOMEBODY put together a real nice compendium of stuff about recharging, zapping old, etc., NiCad batteries/cells. Trouble is, I can't find it. Bob Parnass (?) recently tacked on a short bibliography to a Bearcat 800XLT article, but the items I could track down didn't cover the part I was most interested in recalling, namely, the zapping of weak cells.

Can someone, perhaps the author, point me to the right volume/issue of the archives, or even e-mail me? I don't know if it's worth reposting if we can just FIND the d*mn thing!

Thanks,

Ted

4121. Every one uses them -how do they work?Matching networks-

Newsgroup: rec.ham-radio
Date: 1989-11-20 14:55:07 UTC
From: derek@hppad.HP.COM
Message-ID: <3330002@hppad.HP.COM>
Source record: 15442

For the past week I have been trying to build and design a trans-match
so I can match my 50 ohm transmitter to my "random length" wire antenna
(I live in an apartment so my antenna is quite crude) - a good solid
transmatch in my situation is absolutely necessary.

I am aware of many garden variety circuits in many magazines but I wanted
to do maore than just blindly follow some step by step construction notes -

how exactly does a pi network or a T network transform a mismatched load
into an apparently matched one? I attempted to perfrom basic calculations
on admittance vs. frequency and after getting lost in the complex algebra
I found it behaved somewhat like a tunned circuit - but why? My brute force
calculations provided me with the response but I still don't have a "feeling"
for how these networks work.

Can any one suggest the network best suited for antenna-matching and perhaps
briefly explain why and how these networks can transform impedances and perhaps
how one might go about home-brewing his own??

Any help will be greatly appreciated!!!!

4123. Amateur Radio Exams for PC (AutoExam)

Newsgroup: rec.ham-radio
Date: 1989-11-20 15:36:01 UTC
From: rbono@necis.UUCP
Message-ID: <1175@necis.UUCP>
Source record: 15449

Seeing all the questions about the Mac' Hyper-card stack that is
available for brushing up on the Amateur exams reminded me that I
have not yet released my version for the IBM-PC family...

Is anyone interested in this type of thing? Here are some
specs:

AutoExam: Generates an exam from Novice to Extra. Different
version *every* time. Answers to a particular question are also randomized!!
This program (at this time) does NOT use any graphics, or special colors.
This allows it to be accessed via packet radio (i.e., under DOSGATE).
The program can be used interactivly, or to print exams and answer keys.
It can also print a study guide.

Limitations: Not currently using graphics, so some questions that
deal with drawings (schematics) are *crude* to say the least (I am currently
working on makeing a graphics version of this.
Runs under MS-DOS (version 3.x or newer). OS/2 version upon next compile.

Last years question pools... Novice to Extra... need to obtain the
new question pools... (this is not too much of a limitiation as most questions
in last years pools *very* similar to the new pools.

I am not in the distribution business, the software currently has
a 'shareware' type of label on it... I am about to remove this 'restriction',
that was actually placed on it to deter requests for me to send copies
of the program to each individual...

Also I have AutoCW, with runs under DOS or OS/2. This program makes use of
the computers hardware for timing and requires NO calibration routines or
other fear of bad timing... It is NOT a flashy graphic-color program, but
a good tool for generating either random code or keyboard/file driven code.

If there is an interest in this stuff, I will make it more available
to the usenet community..

Ken--Just a comment on your netnote. I would like to go on record that I REALLY appreciate what you've done for the ham radio community with your brilliant contest logging program. And I also appreciate your apparently generous spirit in making the program available vice $29.95 here, $19.95 there, etc. Your product could clearly be sold!

It seems we're all terribly "busy," but you can at least look upon your program with pride knowing you've made DX contesting a more pleasant experience for several thousand of us. I'll be using it at N6ND's during CQWW CW this coming weekend.

Aw come on Jim. Lighten up. I hardly think that Bob's posting of
publicly available frequencies is going to have any effect on shoplifting.
How many shoplifters do you think have access to this net, have a scanner,
and would take the time to monitor during the crime? And how many of those
do you think could not simply buy the frequency book?

Bob,

I want you to know that some of us really appreciate your work in
cataloging frequencies. I tend not to save the posting but I do know
where to come if I need assistance. Thanks.

Re: Amateur Spooks

As a former military officer, I've heard the radios on both sides of
the encryption equipment. If it isn't encrypted, it isn't very interesting
as a national security matter. It might only be news. (Emergency
freqs are particularly interesting.)
(" Denver Center, United XXX with you at 18 thousand. "
< pause>
"Ooops")

I enjoy listening to Police, Fire, military etc.

Besides, how else are you going to know how badly screwed up the News
Media get the stories :-)

Given the Communications Privacy Act of 1934, there is a long established
tradition which allows this. It might even be useful in terms of understanding
what the military is *really* doing ....

What is the purpose of posting these kinds of comments to the net?
Jim, could you lighten up a little? Direct insults among a public
forum are not going to change anyone's mind one way or the other. They
are only going to make people mad... and people that are mad don't
discuss, they don't learn, they don't exchange ideas. They just get
mad. A little sarcasm with a smile is one thing.... direct insults
are quite another. The information he posted is available to anyone,
he didn't "steal it", it wasn't "bought from a spy". If you are going
to get mad at someone, get mad at the government that releases that
information to anyone that wants it. The fact that it is considered to
be one of the freedoms that this country is built around shouldn't
matter. Argue with the FEDS not Parnass... let us all know how you
make out.

Your interpretation of MY interpretation is erroneous. The act meant JUST what it said: You can (could) listen to ANYTHING, but you can't make commercial gain of it. As I remember, the question was discussed in my study text for the 1st Class Radiotelephone license. The ECPA was sponsored (IMHO) by drug dealers who wanted to be able to conduct business over cellular phones, but be protected from arrest and prosecution by eavesdropping police.

For communication that MUST be secure, encryption devices are readily available. The presumption is, then, that plain text transmissions do not fall into the category of MUST be secure.

>You shouldn't have to trust me. I'm not involved. It's the message sender's >right to say "This is none of your business." This right is protected by the

>constitution and laws of the United States.

Oh? Just where in the constitution does it say that? If you choose to use a message sending medium that is inherently non-selective, such as a billboard, what right do you have to tell me not to read it? And do you also have the right to tell me not to listen to, say, Radio Moscow? or Voice of America?

Facists ALWAYS believe that THEY are the keepers of the one TRUE WORD.

Mr. Grubs, Am I to presume from your posting that we should not listen to anything not specifically intended for us ? Hmmm, that would leave out almost all scanner type listening, (police, fire, ambulance, snow plows, commercial aircraft, etc) as well as a good part of the short wave spectrum as we might stumble upon a coast guard rescue in progress, or something else. And if all the above is true, then all radios should be designed with all of these illicit frequencies locked out, or better yet, make them all crystal type and force us to go down to the U S government crystal store where we can register our radios and get only the "APPROVED" crystals for our radios. Oh yes, don't forget the once-a-year inspection of our approved radios. You're living in the wrong country, Mr. Grubs. And there are fewer and fewer places for you to go. I think Albania, and Rumania may still have the the "thought police". Even the Berlin Wall is starting to come down.....

4133. A mobile vhf kilowatt

Newsgroup: rec.ham-radio
Date: 1989-11-20 18:58:00 UTC
From: CHR%UTRC@utrcgw.utc.COM
Message-ID: <8911210810.AA09993@ucbvax.Berkeley.EDU>
Source record: 15473

Greetings,

Since I have moved into a condo, I have been thinking about running a kilowatt
out of my van..... some problems I have thought of are:

o the power source - perhaps 5 or 6 car batteries connected in series.

o bypass the ac input to the amplifier.

o protective inclosure for the batteries and amplifier.

o mounting hf and vhf transceivers - perhaps vertically.

That enough for a start..... comments please!

I'm looking for a source for a 120 (120/240?) VAC generator that can be powered from a utility engine (I've already got the engines, so I'm not looking for an integrated engine/generator unit.) I assume the emergency-service and field-day operators know about this, and would appreciate info. Email is fine. (Comments on regulators and frequency governors appreciated, too.)

Thanks, Gary (preparing for the next big quake...)

> from Kinetic Designs

Just a note that the "official" (translation: the KA9Q project is
low on fiats, so this is as official as we get :-)) source for updates
to the Macintosh version of Phil's software is:

Doug Thom N6OYU
1405 Graywood Drive
San Jose, CA 95129

(He's also thom@apple.com)

The programming on this version is being coordinated (and mostly done)
in this area, and Doug always has the latest release. So if you're interested
in amateur TCP/IP, I'd strongly recommend that you get on Doug's mailing
list so you'll know about the latest updates directly from the source.

We also now have a European "distributor." :-) Write to me for details.

73,
Patty

>

This answer is completely and totally wrong that I just can't resist jumping in. In the future, please keep your ignorance to yourself. As a matter of fact, HAVE implemented a Costas loop for BPSK and QPSK on the DSP56001 and in 'C'. It performs (MEASURED) within 0.1 dB of THEORETICAL BECAUSE the things you mentioned counters, multipliers, filters, etc. WHICH ARE NEVER perfect in analog hardware, ARE nearly perfect in digital form. I apologize for the tone but your statements are just plain completely false. The transition followers, and other forms of hard limiting you mentioned, are decidedly INFERIOR. This is called Van Vleck's law about the approximately 2 dB (in a perfect implementation) loss in output SNR caused by the limiting process (which is an information theoretic result which follows intuitively since you are throwing away all the information except when zero crossings occur).

On the other hand, you have given EXCELLENT advice in reading material. It is outdated when considering all that has been done in DSP, but it is still excellent reading. I find myself returning to it over and over. I recently wrote a sampled-derivative clock recovery algorithmn in C and DSP56001 assembler for several modems, the details of the ANALOG implementation are in Gardner, and have been used suboptimally by WA4DSY in the 56 KBPS MSK modem. Another, slightly more modern treatment of modems and other interesting topics can be found in the book Digital Communications by Edward Lee and ?. Messerschmidt. It's treatment of PLL's carrier tracking, clock recovery, Trellis encoding decoding (Viterbi) are good and the references are excellent. Charlie, you know how to contact me, you can get details in readable "C" from me on the Costas Loop and an even better algorithm based on an Arctangent phase error detector (BETTER because it CAN BE DONE IN DIGITAL FORM; NEXT TO IMPOSSIBLE IN ANALOG form). I will talk to my partners about giving out the DSP56001 code, and TMS320C25 code for doing the Costa's Loop and make

it freely available somehow if we all agree.

4138. Scanner with spectrum analyzer

Newsgroup: rec.ham-radio
Date: 1989-11-20 21:20:01 UTC
From: phil@east.Berkeley.EDU
Message-ID: <19778@pasteur.Berkeley.EDU>
Source record: 15454

Paul Bame asked about a scanner with a LCD spectrum analyzer he saw in an EEB catalog. I saw a full page ad for what I suspect is the same scanner in Electronics and Wireless World.

The model is the the Standard AX700E Scanning Receiver. It's hard to tell from the photo, but I'd guess it's about the same size as a FRG 9600, maybe a bit smaller, with about a 3"x4" LCD display that shows the frequency and the spectrum. It covers 50 to 905 MHz, receives AM, WBFM, and NBFM, and can scan in 5, 10, 12.5, 20, and 25 kHz increments. There is also a 1 or 5 kHz up/down button. It runs on 12 V and has 100 memories. The pan display can be set for 100 kHz, 250 kHz, or 1 MHz wide.

The company selling it is Lee Electronics, 400 Edgeware Rd, London W2, England. I'd be very interested in comments from people who've actually used one.

Van Vleck's (also known as the Arcsine law [e.g., in Papoulis' Probability theory book]) sqrt(2.pi) result is in fact only good for small signals in Gaussian noise - AND you have to adjust the spectrum by the arcsine law to boot. In practice, I expect Mr. Esker's system to underperform Mr. McGwier's system by MORE than 1.96 db.

For those unfamiliar with Van Vleck, it is described in the series of MIT Rad. Lab. books on radar that were unclassified after the war. One of the amazing result of applying it was when Sandy Weinreb (then at MIT, now at NRAO) used it to build instrumentation in the mid-60's that finally detected the OH radical in galatic space. I had hoped to catch a glimpse of Van Vleck in the recent PBS documentary on Radar during WWII, but he was not interviewed. Perhaps some Harvardite can tell us if Van Vleck is still among us (or, did we lose another Nobel laurate to old age?).

If you REALLY have small-signal-in-Gaussian-noise case (like you guys working satellites), then an extension to Van Vleck shows that a 16-level (4-bit) quantizer only sustains a loss of 0.05 db if the levels can be AGC'ed appropriately to the RMS noise level.

4141. INTERNET CALLSIGN SERVER CLIENT

Newsgroup: rec.ham-radio
Date: 1989-11-20 22:56:59 UTC
From: cep4478@ultb.UUCP
Message-ID: <1639@ultb.UUCP>
Source record: 15463

In their infinite wisdom, the people at R.I.T. saw necessary to
remove alternate port access via telnet. Thus, I lost access to the
callsign server for a month or so.

To counter this, I have written my own interface to the server.

It is for any BSD compatible system (ultrix-32 is what I used, but it
worked on the 4.3 machine here, too). (Sorry, I don't do VMS -
actually, I wouldn't mind, if somebody would teach me how sockets
work under vms).

Anyhow, if you have telnet alternate port access already, you don't
really gain much by using this program, except maybe a little typing
here and there, so if you don't need it, it's probably best not to
confuse yourself. The one thing you DO gain is that you can batch
your requests into files, and use the < and > shell operators to
process the lists. For example, you could create a file called "input"
that looks like this:

```
ka2rvo
n2jgw
n1gph
```

and then type:

```
ncall < input | lpr
```

or something like that.

Anyhow, here are the rules:

(1) Please don't fool with the code. If you DO modify
it, you may not distribute it further.

(2) I'm not responsible for any of this. No warranties
etc. Devon looked at the code and has no
objection to the program, but it's not his
problem, either :-) (actually, I'm a nice
guy with lots of time to kill, so I'll help)

(3) Please drop me a note if you find this thing useful.
I'm a poor college student, and I'm very vain. =)

So, here goes.

4145. Re: Mexico operating

Newsgroup: rec.ham-radio
Date: 1989-11-21 00:31:17 UTC
From: ballard@cohesive.UUCP
Message-ID: <582@cohesive.UUCP>
Source record: 15462

I was in Mexico last year as the skipper of a sailboat which was
equipped with ham radio. The procedure for getting a Mexican ham
license is as follows:

1) get your mexican tourist card. (necessary for travel in Mexico)
2) Make a copy of your US ham license.
3) Get a letter of sponsorship from a Mexican ham.
4) Take all of the above to the SCT office in a state capital.
(SCT = Secretary of Communications and Transportation)
The SCT controls Radio, TV and Bus service.
If you are going to Baja, the state capitals are Mexicali for
Baja California Norte, and LaPaz for Baja California Sur. If
you go anywhere else besides a capital you will not be able to
get your license the same day as the paperwork must be sent to
the state capital.
5) The SCT will give you a form to take to the Hacienda (the people who
take your money) where the fee will be collected. $25-$35 depending
on where you go. The Hacienda will stamp the form which then must be
taken back to the SCT office. The SCT will issue you a callsign on the
spot. They look up available callsigns on greenbar computer printouts
and scratch off the one that they assign to you. There seems to be a pool
of callsigns assigned to each state.

P.S. The Hacienda collects money for all government agencies, and they are never
located near the agency that you are going to which requires a taxi ride. Taxis
are regulated by the SCT also.
When I went to get my license I did not have a letter from a Mexican ham, the
gentleman in the SCT office told that he would issue me a license this time
without the letter but that I should have it with me when I came back for
renewal. The license is good for the duration of you tourist card. This is
usually six months but I heard that they would issue two year tourist cards
for transiting yachtsmen.

Good Luck!
John KI6PS ex XE2HVC

>

I've been thinking of getting a spectrum analyzer, maybe I just need
a new scanner. I'm a bit dissapointed in my PRO-2004, too many memories
to keep track of.

The AX700E sounds interesting. Don't suppose it allows full control
via RS232 and the ability to override the default de-modulation mode ?

Any idea on what these sell for ?

Prehaps someone who owns one of these would care to do a "product review"
for us ?

Hehehe. Actually he fell in love with a Tahitian, namely, the island beauty who
was his love interest in that movie. Don't know if he married her, but they had
a child, a boy, I believe.

Incidentally, Brando played Fletcher Christian, whose descendent, Tom
Christian, VP6TC, still lives on Pitcairn Island to this day.

The privacy portions of it were intended to forbid disclosure of private (as opposed to BC) information which one happened upon by chance. I do not believe the authors anticipated that a cult of people who search out such information would arise. In that sense ECPA is a correction of an omission. If the authors of the CommAct had anticipated that cult, the CommAct provisions you cite as permission would not likely exist.

>
> SQRT(37 x 72) = 52 ohms!

Sorry Bob, the 72 ohm line will transform 37 ohms to 140 ohms
SQRT(140 X 37) = 72 ohms!!
Perhaps the vertical has 100 ohms input impedance on 10 meters
since it is more than a 1/4 wave long. The 72 ohm coax would
convert this to 50 ohms.

>
> (And now we start to see that the characteristic impedances chosen for
> "standard" cables weren't quite so random after all! :-))

As explained in the MIT Rad. Lab. series, 50 ohm air line has minimum
loss for a given maximum usable frequency (based on high order mode
conversion being the limiting factor). 74 ohm air line has minimum
copper loss for a given diameter. Accidentally, it turns out that
50 ohm polyethylene line has approximately minimum copper loss for
a given diameter. Finally, 30 ohm air coax has maximum power handling
for a given diameter, assuming power is limited by breakdown voltage
of air.

The ECPA was pushed thru congress by the cellular phone people so they could convince yuppies that their conversations couldn't be overheard. The fact that older UHF tuners can pick up some of it and that it is NOT illegal to make or sell receivers that include coverage of frequencies that contain protected conversations is overlooked in phone company ads. The phone company tried to have the FCC force manufacturers to delete coverage of these frequencies from scanners or other receivers, but the FCC refused, pointing out that the frequencies could be used for both protected and non-protected communications, depending on geographic location and other factors. If you really want or need privacy don't depend on this unenforceable toothless law. Do as the military does, if you say something over an unencrypted radio transmission assume that people are listening and act accordingly. If you don't want easedroppers, encrypt your transmissions!

I really think you need to lighten up Jim before you give yourself a stroke. Your attitude is like our local police used to have before scanner owners monitoring their transmissions helped them nab bank robbers and other criminals. The lady that helped the cops with the bank robbers, by the way was a granny in her 80's. She got an award from the city for her actions. As I said in my previous postings anyone wanting or needing private communications should not assume that omnidirectionally transmitted radio signals are not being monitored. The major manufacturers all have plenty of secure radios that police and security companies can use. You can't legislate what people do with their receivers in the privacy of their homes. The base where I work has both encrypted and "in the clear" radio channels. The security force uses the secure channel and the fire department, public works, base taxi etc. use the unencrypted ones. BTW the ECPA also makes it illegal to listen to encryped transmissions if you figure out how to break them. ;-) The ECPA is just a stupid law that the phone lobby pushed thru a congress that doesn't understand diddly about radio. It had nothing to do with scanner owners monitoring the cops, fire company, mall security or other frequencies. The only ones who backed the ECPA were the cellular phone companies.

IMHO you have this backwards. The ECPA was sponsered by the (Gestapo) police
to make the drug dealers believe that their cellular telephone transmissions
were not being listened to so they would not try to scramble them. Today
(unlike in 1934) Constitutional freedoms (such as the right to burn the very
symbols of those freedoms which does not hurt them) are being tossed out with
the drugs. :-)

> For communication that MUST be secure, encryption devices are readily
> available. The presumption is, then, that plain text transmissions do not fall
> into the category of MUST be secure.

That's what they want the drug dealers to think.

Subject: needed circuit to read cw

> Got the pc sending cw via the serial port driving the key now i need a
> circuit to read cw and toggle the serial port so the pc can read cw alos.

I built a pretty good circuit for doing this about 10 years ago. I got it
from an article in Ham Radio magazine in either 1979 or 1980, written by
Frank W3EBS (I think). Basically, it was a PLL on the front end that would
lock on an audio range signal. You could set the lock frequency and bandwidth.
It then used a 555 timer/oscillator to regenerate an audio tone, but I also
had a TTL output on the thing. I had it interfaced to a Shadio Rack Color
Computer which I sold along with the CW interface.

It actually worked pretty well, but the wide variances in CW fists is a
real challenge to a CW recognition program. My program went strictly on
a character by character basis and did a decent job on keyer sent CW but
you really need some back end processing to look at syntax and vocabulary
choices to have a machine decipher average hand sent code. Typical QSO
vocabulary is pretty limited, so you could have the program go back and
change "rsg" to "rig" and "ph gbl" to "pse qsl".

If you can get hold of the December 1979 and 1980 issues of HR you should
be able to look in the annual index.

4159. Custom QSLs - how to

Newsgroup: rec.ham-radio
Date: 1989-11-21 14:14:14 UTC
From: harrism@aquila.DG.COM
Message-ID: <518@xyzzy.UUCP>
Source record: 15278

Somebody was asking about using a silk screen kit for producing custom QSL cards. My experience (in printing shirts with one) is that the regular kits, with the screens provided, won't give enough resolution unless the type is fairly large. Regular sized printing wouldn't cut it.

I enjoy sending out custom QSLs for special contacts. Here is my trick. I make custom photo QSL cards. I use a double exposure method which produces a white call against whatever non-white background is convenient - such as you & your shack!

To do this, you must produce a large negative of your callsign. Do this with a piece of white translucent material (milk jug plastic, etc). Buy a sheet of vinyl letters from the Hobby/Stationary store. The ones I bought had the letters cut out, however, they left all the plastic on the sheet. Peel out the letters from the inside & stick 'em on your refrigerator or your kid. Cut out the border & stick it on your translucent plastic. Do this for each letter and number of your call. Then fill in the spaces & gaps with an opaque marker and electrical tape. You now have a negative of your call sign! (Oh - I bought the one inch size. Anything about that size is fine. You get to pick your font also!).

Next, take a box (I used a photo copier paper box) and stand it on end. Then make a cutout on the bottom for your negative. Tape your negative to it & make a good light seal around the edge. Place a lamp (careful - incandescent lamps can get hot esp if it tips) inside. I used a 60 watter. Seal the edges of the box and put it at the end your dark closet. Then, prop your camera on a tripod a couple of feet away. Adjust the camera distance, etc, until your call sign is in focus, is the desired size, and is in the desired place in the frame.

The cards are made by double exposing the call sign & then your mug. This procedure overexposes the film where your call sign is & produces a white background. Not a lot of contrast is required - just don't place your white callsign against your white wall.

You will have to experiment with a roll of film to determine the proper exposure for your film/camera/lens/call-sign-apparatus. I was using an f3.5 35-70 zoom with ISO 100 film & a 100 watt bulb. Proper exposures were had with about 1/2 - 1 second exposures. Your second exposure should be metered as normal. Shoot a whole roll, documenting every parameter. Bracket heavily. My first roll, I shot from 1 second to 1/60 second & against a variety of backgrounds. (I would reccomend bracketing from 2 - 1/8 second). After the first test roll, you can determine which exposures are correct for you & which backgrounds are best.

When you find the right combo(s), shoot a whole roll (it's the cheapest way to get reprints). From then on, just order more reprints from the negatives!

Several companies make convenient rubber stamps to stamp the "form" on the back. Look in the back of your favorite rag. It'll run you about $7.00.

Work me on 40 or 10 & you can see what mine look like!

73's & happy QSLing . . .

Well, I don't believe there is ANYTHING illegal or immoral about posting this; the information is readily available (both to you & me and the Soviets), and if the military didn't want to be heard, they'd be encrypted and/or use spread-spectrum or frequency hopping - they definitely would NOT send in the clear.

For all you anti-freedom-of-anything people, here goes. Dontcha just love America? This is precisely what makes us different (better), people!

----- cut here ----------
Upper side band is used almost exclusively, except for some LSB VIP communications.

Skyking, Foxtrot, and EAM (Emergency Action Messages) appear to be related to the status of nuclear defense forces (coded messages are passed via clear voice). They are generally in one of two nets, SAC or GCCS (Global Command and Control System).

MAC is Military Airlift Command. VIP planes generally are out of 89th MAW (Military Airlift Wing).

Here are some of the more interesting (or common) callsigns. I'll assume the meaning of some of the more common acronyms is obvious. Any of the "1" callsigns signifying president aboard can be replaced with "2" for the VP. In some cases, there are 2 callsigns with the same meaning; I show them on the same line.

Callsign

Acrobat - Andrews AFB
Agar + 2 digits - EC-135N (Flying Command Post)
Crown - White House Comm Agency
Dropkick - SAC HQ, Offutt AFB, NE
Electric - National Emergency Airborne Command Post
Edgy + digits, Sentry - AWACS, Tinker AFB, OK
Army 1 - Army helo with President
Exec 1 - Commercial flight with President
Exec 1F - Commercial flight with President's family

Fertile - SAGE/NORAD network center, Ft. Lee, VA
Fivespot, Fletcher - Commando unit designator
Flynest - Nuclear & Chem/Bio Warfare Disaster Team
Golden - General net Air->Ground for any TAC station
Goliath - NORAD, Duluth, MN
Hilda - MAC Command
Jolly + 2 digits - SAR (Search and Rescue) helo (not on mission)
King + 2 digits - SAR aircraft (not on mission)
Marine 1, Night Hawk - USMC helo with President
Mac + digits - MAC aircraft
Mainsail - General net Air->Ground for any GCCS station
Pedro + 2 digits, Save - Local rescue craft
Phantom - MAC, European Theater Control
Ringmaster - NORAD HQ, Cheyenne Mt., CO
SAM + digits - VIP mission
01 = foreign head of state
86971 = Secretary of State
86972 = National Security Advisor
Skybird - General net Air->Ground for any SAC station
Skyking - General net Ground->Air for any SAC station
Spar, Afkai + 2 digits - 89th MAW, VIP
Swan, Teal - Weather recon
Tonight - MAC Pacific Control
USAF + digits - Flights over foreign territories
3 letter word + 3 digits - Student on training mission
6 letter word + 1 digit - Combat training mission
3-5 letter word + 2 digits - SAC bomber or tanker
6-15 letter word or 2 words - SAC ground station
Abnormal 10 - SAMTEC, Vandenberg AFB
Abnormal 20 - SAMTEC, Wheeler AFB

Some frequencies (KHz):
SAC A (Alfa): 11243
SAC B (Bravo): 11220
SAC Q (Quebec): 6761 (very busy and probably easiest to hear regularly)
SAC YQ: 11408
GCCS 6750, 6753
NORAD 9723, 11141, 11441, 14894
SAMTEC 10780, 13218, 17248, 20390

It's easiest to find military traffic in the following ranges:
6700-6900, 8950-9020, 11100-11300, 13200-13300

VIP aircraft tend to be found in the 11 and 13 MHz ranges. Also, almost
all of the RTTY traffic is encrypted.

It may seem obvious, but if you take the spectrum (applies to VHF/UHF too),
eliminate the KNOWN frequencies (e.g. ham, broadcast, public service, marine),
what's left is generally what the military uses (although they can be found
almost anywhere).

Also, spy stations (e.g. "numbers" stations, RTTY) like to hide in the skirts of a broadcast station signal, which makes them hard to find and copy.

So, what does this mean to WASHBURN looks like a SAC ground station, while ZEUS (correct spelling) and FRED look like either bombers or tankers. ZEUS is almost certainly a bomber. Fred is a Flintstone.

Have Fun!

Well, I don't believe there is ANYTHING illegal or immoral about posting this; the information is readily available (both to you & me and the Soviets), and if the military didn't want to be heard, they'd be encrypted and/or use spread-spectrum or frequency hopping - they definitely would NOT send in the clear.

For all you anti-freedom-of-anything people, here goes. Dontcha just love America? This is precisely what makes us different (better), people!

----- cut here ----------
Upper side band is used almost exclusively, except for some LSB VIP communications.

Skyking, Foxtrot, and EAM (Emergency Action Messages) appear to be related to the status of nuclear defense forces (coded messages are passed via clear voice). They are generally in one of two nets, SAC or GCCS (Global Command and Control System).

MAC is Military Airlift Command. VIP planes generally are out of 89th MAW (Military Airlift Wing).

Here are some of the more interesting (or common) callsigns. I'll assume the meaning of some of the more common acronyms is obvious. Any of the "1" callsigns signifying president aboard can be replaced with "2" for the VP. In some cases, there are 2 callsigns with the same meaning; I show them on the same line.

Callsign

Acrobat - Andrews AFB
Agar + 2 digits - EC-135N (Flying Command Post)
Crown - White House Comm Agency
Dropkick - SAC HQ, Offutt AFB, NE
Electric - National Emergency Airborne Command Post
Edgy + digits, Sentry - AWACS, Tinker AFB, OK
Army 1 - Army helo with President
Exec 1 - Commercial flight with President
Exec 1F - Commercial flight with President's family
Fertile - SAGE/NORAD network center, Ft. Lee, VA
Fivespot, Fletcher - Commando unit designator
Flynest - Nuclear & Chem/Bio Warfare Disaster Team
Golden - General net Air->Ground for any TAC station
Goliath - NORAD, Duluth, MN
Hilda - MAC Command
Jolly + 2 digits - SAR (Search and Rescue) helo (not on mission)
King + 2 digits - SAR aircraft (not on mission)
Marine 1, Night Hawk - USMC helo with President
Mac + digits - MAC aircraft
Mainsail - General net Air->Ground for any GCCS station
Pedro + 2 digits, Save - Local rescue craft
Phantom - MAC, European Theater Control
Ringmaster - NORAD HQ, Cheyenne Mt., CO
SAM + digits - VIP mission
01 = foreign head of state
86971 = Secretary of State
86972 = National Security Advisor
Skybird - General net Air->Ground for any SAC station
Skyking - General net Ground->Air for any SAC station
Spar, Afkai + 2 digits - 89th MAW, VIP
Swan, Teal - Weather recon
Tonight - MAC Pacific Control
USAF + digits - Flights over foreign territories
3 letter word + 3 digits - Student on training mission

4165. The "right to receive"

Newsgroup: rec.ham-radio
Date: 1989-11-21 18:13:00 UTC
From: Ed@ALDERAAN.SCRC.SYMBOLICS.COM
Message-ID: <19891121181318.6.ED@PEREGRINE.SCRC.Symbolics.COM>
Source record: 15283

Date: 21 Nov 89 00:24:32 GMT
From: vsi1!daver!lynx!neal@apple.com (Neal Woodall)

If radio waves reach into my home, then I have a right to receive and attempt to demodulate them.

Where did you get this idea from? It's not in the Bible, the Constitution, the Communications Act of 1934, the ECPA, or anyplace else that I know about. It's a nice idea, it's one that I approve of, but it is NOT one of the recognized rights of society, in the USA or in any other country.

Governments have the unlimited right, which they have exercised in the past and continue to exercise, to determine not only who may transmit via radio and what they may transmit and when they may transmit it and what kind of equipment and antennas they may use, and who may fix them when they break, but also to regulate the reception of radio waves (including who and when and how and with what). The various state scanner and radar-detector laws are examples, as are the ECPA and the Communications Act of 1934 and the zoning regulations of Boulder County.

If you think that the government's rights in this area ought to be restricted, or the individual's rights made clearer, you should exercise your unquestioned right to petition your government for redress of grievances. However, simply declaring that you have a right to receive based on some layman's notion of the laws of trespass does not create that right.

Again, let me say that I agree with the spirit of what you're saying. And I'm not picking on Neal particularly; he's one of many people in this group who have said or thought the same thing. But wishful thinking, even if it has a certain amount of moral force, is not the same as a right, God-given or otherwise.

4166. ANARC BBS - A Review!

Newsgroup: rec.ham-radio

This article was originally published in Kristin Kaye's "Bits, Bytes & BBSs" column in the Umbra et Lux Newsletter. It appears here with the permission of the author.

~~~~~~

The Pick for December

The ANARC BBS, moderated by Kirk Baxter, President of ACE, ought to be the next stop on your electronic itinerary. This system is sponsored by the Association of North American Radio Clubs and carries a diverse and extensive selection of radio-related material.

Kirk offers 'equal time' to any Radio Club that wishes to establish a messaging system. Clubs which are accessible through the ANARC BBS at this time include The Association of Clandestine Radio Enthusiasts (ACE), The Canadian International DX Club, Radio Netherlands' Media Network, the Radio Communications Monitoring Association (RCMA), and lots more.

Downloadable files include extensive frequency listings, equipment reviews and mods, station schedules and an amazing variety of radio-related MS-DOS format programs ranging from code tutors to an FCC algorithm for skywave fieldstrength calculation.

The ANARC Board is a member of the Fidonet (E-mail address 1:280/3). Kirk is Moderator of the National Shortwave Echo and carries the Ham and TVRO Echos, as well. More on the Fidonet Echo System next month.

One interesting item - a Shortwave DX programming database which operates on a 'key word search' principle. Now you remember that from last month's column, don't you? Remember KWIC/KWOC? The ANARC system prompts for a keyword or phrase to begin its search and will retrieve all frequency or programming entries which reference the search key - a good practical example of modern electronic technology and what it can do for Shortwave Radio!

Try this system at 913-345-1978. It's popular and can be difficult to reach during peak weekend and evening hours, but it's worth the effort. Tell Kirk "kk" sent you!

4167. military call signs.....etc.

Newsgroup: rec.ham-radio
Date: 1989-11-21 20:18:03 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <8911212358.AA17672@ti.com>
Source record: 15299

Several prople have correctly cited the freedom to listen to any radio communications. I support that. However, Balinski asked about the aircraft home base, etc. While thr radio transmissions he heard were obviously unclassified, the association of the call signs with aircraft type, unit of assignment and home baseis classified information. That is why I asked why he was interested in that information. The "discussion" quickly spread to a more general area, however, and I'd like to toss in my 2-cents' worth. If any "in-the-clear" radio trans missions are subject to intercept and disposition as the interceptor sees fit, then we should get concerned about our use of cordless phones. Anyone can park in front of your home and receive/record all your personal conversation that you care to "dump" into the public domain and do whatever he/she pleases with it; possibly resulting in some embarrassment to you and your family. As someone mentioned, it's like overhearing a conversation in any public gathering.
We can't have it both ways. Think about it.
Regards,
Dube Todd

I guess I'm not the only one that thinks Bob Parnass's postings are perfectly acceptable (and interesting). But anyways, my 2c worth:

1. Those postings came from (as I understand it) public, open records. If the FCC can publish them, why not Bob?

2. Those transmissions are "readily accessible to the general public" so even under the latest and most bizarre laws, anyone is perfectly free to listen to them. If you're free to listen to them, what's wrong with reporting their existence?

Anyone out there have any experience controlling the
IBM serial port (COM1 or COM2) using Turbo Pascal?

I need to turn on/off the DTR and RTS lines (in order to
send CW). This is easy in BASIC, but I can't figure out
how to do it in Pascal. I imagine it will require an
Assembly Language routine, but the addressess are unknow to
me.

Any ideas?

Woops! I bought one last month at the higher $ price.
I am singularily unimpressed with the talk-out-the-ear.
It is not sensitive enough unless you talk very loud.
The voice transcription is "muddy"...
It uses a 9v cell instead of 4AA cells.
It is nice that it has all 5 channels.

However... The motorcycle headset-intercom works wonderfully.
Unfortunately, it only exists on channel "C".

I need assistance in expanding a Radio Shack PRO-34 scanner to enable
it to receive other frequencies which are presently locked out.
This is scanner model 20-135 from Radio Shack.

I am told a relatively simple modification can be made which enables
the scanner over a range of frequencies otherwise unavailable.

Can anyone help me? Please reply to me direct in email. Thanks.

I have a couple of these things we use to communicate among a bunch
of dirt bike riders. They work great. Audio quality is amazingly good,
at least as good as the typical handheld microphone. It does a good
job of blocking noise -as long as you keep your mouth shut!

We've looked at using these things as a VOX microphone for handhelds. It
should work just fine.

I highly recommend these things for motorcycles, tower work or any
other area where you don't really want to use your hands.

>As a member of USAF MARS BST acrtivities
>I did more of that sort of thing than you might imagine.

The comment stands, however. If you HAD listened to the transmissions, you would realize that they were NOT encrypted. As a member of the military, you should also be aware that anything they want secure, will be secure. If they transmit in the clear, they don't care who listens. Why should you?

- > - > Are you telling me that it is OK for the Russians to listen to SAC, but
- > - > NOT OK
- > - > for Americans to listen to SAC?
- >
- > >It's not OK for either.
- >
- > Right. Well, you get the Russians to stop, then maybe I'll stop.

>Poor excuse! Do you also apply that logic to, say, income tax evasion? Vote
>fraud? Shoplifting?

Non sequitor. What you are implying, is that it is somehow "immoral" to listen to the radio. This is part of your personal belief system, perhaps, but you should be aware that not all of us share it... and we are not doing anything illegal by not sharing it.

- > - > When I was a kid, we had the Communications Act of 1934, which said I

>are now joined by WA4JQS, XE1VIC, W9ARV and KM4KJ, is expected in
>February 1990.

I don't know where the person who writes the ARRL DX bulletins got the idea that the NCDXF is a participant in this DXpedition, but it isn't. One of the Foundation directors (the president, to be specific) is going on the trip, but that's simply because he's an ardent DXpeditioner. He's going as a "private citizen," not as a Foundation official.

In fact, we aren't even putting up any money for this DXpedition; they are so well funded (mostly by the Saturday Evening Post) that they don't even need our help with the cost of QSL cards.

The Foundation is happy that Bouvet will again be on the air, but we aren't involved in either of the planned DXpeditions.

73,
Patty N6BIS
(NCDXF Advisor)

p.s. I increased the distribution on this to "world" because folks outside North America might have received the ARRL bulletin through other means, and I wanted to correct this misinformation as widely as possible.

As a practical matter, it is necessary. It should NOT be necessary. To return to the ubiquitous highway/automobile analogy, it is illegal to strip a car in a mall parking lot, even if the owner forgot to lock it. Finding an unlocked car does not make it or its contents public property.

> >This right is protected by the constitution and laws of the United States.

> the frequencies of all the police frequencies in the USA?

In principle, none. In practice, the shop cop frequencies (combined with a handheld scanner) have a much more easily implemented immediate, practical use. When I was a police dispatcher, my chief had a rule: "We can't stop them, but we can sure is hell make them fight uphill for everything they get."

]The comment stands, however. If you HAD listened to the transmissions, you
]would realize that they were NOT encrypted. As a member of the military, you
]should also be aware that anything they want secure, will be secure. If they
]transmit in the clear, they don't care who listens. Why should you?

This former member of the military would disagree with you. I once heard a FLASH priority message which indicated a hostile ballistic missile launch - in the clear! Turns out it was a drill, but you couldn't tell from the message.

After the USS Pueblo was captured (1968?), we (Navy ASW Air) operated in the clear for several months because our code books had been comprimised.

We used to practice highly classified anti-submarine tactics, communicating with the trainers on UHF unencrypted voice. Anyone listening (including the Soviet trawlers that were frequently within 20 miles) could decipher the transmissions (they were, after all, in the clear) and deduce the exact tactics we were using.

I must add, however, that I also think Jim got out of hand in harrassing Bob Parnass for publishing store detective frequencies. If you don't want it to be intercepted, ENCRYPT IT!

By the way, it is the policy of the local (Phoenix) police to transmit all but the most sensitive communications in the clear. They want the press and the public to hear what they are doing, and recognize the public's legitimate interest in monitoring those frequencies to see if the agencies are acting properly!

>the Communications Act of 1934, the ECPA, or anyplace else that I know about.

I would argue that it is in the Constitution. Not directly, perhaps, but
it's still there. It's the Fourth Amendment that prohibits unreasonable
searches and seizures.

Why the Fourth Amendment? Because, local oscillators notwithstanding,
there's no way to know that someone is monitoring radio communications from
the privacy of his home unless you break in and catch him in the act.

A law, like the ECPA, that prohibits the passive reception of radio signals
is unenforceable outside a police state. Perhaps even in one; the Soviet
Union and China have not been thoroughly successful in their attempts to
stop their citizens from listening to western radio broadcasts.

> of the CommAct had anticipated that cult, the CommAct provisions you cite as
> permission would not likely exist.

This depends on WHO writes it and WHEN. If *I* were to write it today, it
would probably be just about the same as it is, except that there would be
EXPLICIT references to requiring the use of scrambling and encryption for
secret communications, and ensuring no more secrecy of communication than
the scrambling or encryption itself can assure.

> The Bill of Rights provision forbiding unlawful search and seizure.

I fully believe, and stand by my position, that searching out and seizing
the little electrical currents in MY wires on MY property caused by someone
else who was making BIG currents in his wires, thus causing the little
currents in mine, is NOT an invasion of his privacy no matter how fast or
how slow he happens to make those currents alternate.

If I come onto your property and disrobe, I don't see how I can possibly
support an accusation of unlawful search and seizure on your part.

> > Facists ALWAYS believe that THEY are the keepers of the one TRUE WORD.
>
> Generous of you to admit it.

Each of us has their own words, of course, called opinions.

Facists (and some others) actually try to cause it to be that everyone has
the same exact words.

4185. Can't reach service dept

Newsgroup: rec.ham-radio
Date: 1989-11-22 10:40:28 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500294@ux1.cso.uiuc.edu>
Source record: 15311

If anyone is considering buying a radio from one of the big three, consider the following experiences I have had in trying to call the service departments of all of them (was getting technical info, so the marketing types said to call the service dept).

ONE of the companies has installed an automatic phone answering and response system ahead of several departments including the service department. I was asked to press a touch tone button for the appropriate department. When it said what the number for service was, I pressed it and the machine then said "please wait". A few seconds later it said "the line is busy", then started the original message all over again. Each time the line was busy.

Typically service departments are busy. While one can gripe about that, it can be expected and is expected.

What is very bad about this is that I have to pay for a long distance phone call to find out that a department that is usually very busy, is busy. With an ordinary direct phone line, I may have to try the line several times and soon will get in. This automatic system has got to go for service.

I will be writing a letter to this company explaining my disgust with the way they treat customers, and that I will no longer purchase products from their company until definitive action is taken (and implemented) to correct the problem.

Until I have given them a chance to make quick corrections, I will not name them, but of course you would only have to try an average of 1.5 phone calls to figure it out. What I would suggest if you are considering making a major purchase is to contact the service department of the manufacturer and see if the way they do business is satisfactory TO YOU.

My friend Sam Povone W2DDN runs a KW on 20 meters from his
Dodge pickup truck using a homebrew 3CX800 amplifier powered
off the truck's alternator. He tapped off the AC output from
the alternator and feeds it into three custom made (in Florida)
transformers. This was written up in QST a while back. The
supply puts out about 2500 volts and since it is a grounded grid
amp triode only filament voltage is necessary. I don't
have Sam's address handy. He lives in Boonton, NJ and is good
in the callbook. Contact him and mention my name..we work at
the same place.
Have fun

Exactly! The ECPA specifically omitted cordless phones from its
restricted-list because they have "no reasonable expectation of privacy".
I have heard stories about how criminals have been successfully
prosecuted with evidence obtained from monitoring cordless phones.

I don't use them. If I did, I would build scrambling circuitry into it.

> Regards,
> Dube Todd

Anyone who uses a cordless phone and thinks that nobody else can hear
it is a fool. I don't monitor anything but the ham bands (because I
don't really care about the rest), but I have frequently heard cordless
phones at the bottom of 6 meters while tuning around. I have on
occasion stopped long enough to hear where they were from. I have picked
up cordless phone transmissions from as far away as 8 miles over rather
mountainous terrain. What makes it even worse is I have compared the
sensitivity of my scanner and my 6 meter rig and the scanner was better.
I hardly think anyone needs to park in front of your house to listen.
Just for the sake of showing how little the public really knows about
the technology they use on a day to day basis, I once overheard the
beginning of a conversation between 2 family members that started with:
"Don't tell this to anybody....." While every scanner freak within a
8 mile radius listened in!!!!!

Yes the big three are somewhat difficult to do service bussiness with.
I have had a unpleasant experience also with one of the big three. It
took SIX WEEKS to get an estimate for repair. Either they are very
understaffed, or the radios break a lot. Well since the big three are
Japanese, perhaps one should consider American. Ten-Tec makes some
very good radio and have a very excellent repair department, which by
the way the phone is answered by a person. They will also help you fix
your own radio, sending you the parts before you pay for them. Seems
like they want a happy customer.

. Dube Todd

Some people are like sheep, and feel content to be lead, and to believe what they are told by others. Others of us tend to be distrustful of "authority", and want to find out for ourselves.

What I don't understand, is why YOUR being uncomfortable with MY curiosity should make you want to supress it. My "rights" to know everything don't depend on my owning a receiver. When the actions I engage in are not illegal, where is your "right" to supress it?

Aren't the ill-mannered ones those who are beaming this energy through my house?

The police want to send a secret message to one of their drug operatives in Santa Cruz, California, so to get the message to their man, they fire up the Civil Defense bullhorns and broadcast their secret message all over the city.

Their man gets the message. Unfortunately so do many of the other people who happen to be in Santa Cruz at the time. The police are concerned as their message was not intended for the ears of the public, yet somehow it ended up in the hands of private citizens. The police don't seek a technological solution as that would cost them money. Instead, they lobby the legislature to pass laws that would define "intercepting" announcements made via bullhorns as "criminal eavesdropping."

In an attempt to prevent these "criminal eavesdroppers" from jeopardizing police operations, the legislature passes a law that requires everyone (save for the police, of course) to wear earmuffs.

> Dube Todd

Let me get this right. Your problem is not with his listening, but with his curiosity. You are upset because he is curious. I.E. You don't like the way he "THINKS"? People should only be allowed to be curious about things that YOU approve of? Would you not agree that this is a rather radical point of view?

A person posted a request asking for some information on something that he was curious about, he did not say "EVERYONE ON THE NET WILL IMMEDIATELY GIVE ME THIS INFORMATION ON PAIN OF DEATH". He simply ASKED... he did not demand. No one "MUST satisfy his curiosity, only those that feel generous enough to do so".

No one has said anything in any of the postings that I have read to date that people HAVE THE RIGHT to know what they are listening to. However, given that this is a free country (it still is isn't it?) I believe that anyone has the right to ASK.

If you disagree with that, and want to also control peoples curiosity, then I am afraid that your views contradict those of our founding forefathers.

Is this discussion about ham radio? Is the next topic going to be whether people should be allowed to believe in Buddah? Is this reply as ridiculous as the original posting? Hmmm... yes it is.

Paul and Mark:

I could not agree more but you should read the Electronic Communications and Privacy Act carefully. Further, don't get caught by a sheriff in certain New Jersey counties with a 2 meter rig that is CAPABLE of receiving police communications or they will charge you with a crime and put you in the klink. This is being fought here but these are the facts, as despicable as they seem to hams and shortwave listeners and scanner buffs.

Phil, there's no way to know if anyone is doing anything illegal in the
privacy of their own home unless you break in and catch them in the act.
Does that mean you can use illegal drugs, decode encrypted cable TV or
tear the "do not remove" tags from mattresses with total disregard for
the law? If it is illegal to wiretap phones, then why should it not be
illegal to "airtap" cellular phones. The results are the same, though
the means are different. Agreed, enforcement is a problem and cellular
phone conversations should be encoded, but if it is not illegal it is
de facto legal and therefore, by default, approved. I don't like that
idea much either.

I think the best statement on this was from a Sercret Service higher-up, when asked why they use code names for the persons they protect when everyone knows wha they mean. It's not for secrecy, he explained, but for simple convenience. We have a simple rule: Don't say anything on your radio that you wouldn't want to hear broadcast over the PA system.

And that's the size of it. The ECPA sets a terrible precedent. Funny, isn't it? As the USSR shuts down its jammers and the wall comes down, we have more laws restricting our freedom. Stupid ones at that. Scanner laws are like many of the gun laws: They don't stop the regular criminals, they just make new criminals out of technical violators. What societal purpose is served by imprisoning someone for listeing to 800MHz? As long as you don't disclose what you've heard, fine with me. If you want security, go microwave point-to-point, or encode, or...

This has been an unpaid, and hopefully not excessively flaming, editorial comment from ke8yy

(...and about all those flames: There is a nice way to criticize and argue, and there is an immature way. I don't care how wrong, misguided or mistaken someone is. When I was a small child I was taught to say "I think you may be mistaken...." or "I would disagree..."; *not* "Keep your ignorance to yourself" or whatever. We all have an equal right to be wrong. Sometimes this group makes the top 10KHz of 75 look like a tea party. And anyways, my mom says if you don't all play nice I can't come over any more.)

4202. (Lack of) Service

Newsgroup: rec.ham-radio

I have a lot of sympathy with Phil H's comments in Digest 918, but I think they're only the tip of the iceberg. Actual service is worse. Rigs go in for 6 weeks and show up with the same problem. Service manuals are unavailable, dealers are no help, etc. and etc.

That's one reason I decided to go back to Ten Tec. If you've never dealt with them, be prepared for a shock. They always answer the phone, they mail out service manuals (or copies of out-of-production manuals) with a bill (no prepayment needed), they answer service questions on the phone, they will mail you modules to plug-and-switch on approval, they credit returned modules against new ones, and in general they act like you're doing *them* a favor for doing business with them instead of the other way around.

I have absolutely no connection with this company or its dealers; I just had to say how refreshing it is dealing with them again.

>It's a nice idea, it's one that I approve of, but it is NOT one of the
>recognized rights of society, in the USA or in any other country.

Read the Communications Act of '34. The spectrum is defined as a PUBLIC
resource, to be managed in the best interests of the citizens. The ECPA
was a legal necessity, because up to that time, USCA34 was interpreted as
prohibiting restrictions on reception. It was thought that this interpretation
was most consistent with the first amendment.

>Governments have the unlimited right, which they have exercised in the past
>and continue to exercise, to determine not only who may transmit via radio
>and what they may transmit and when they may transmit it and what kind of
>equipment and antennas they may use, and who may fix them when they break,
>but also to regulate the reception of radio waves (including who and when
>and how and with what). The various state scanner and radar-detector laws
>are examples, as are the ECPA and the Communications Act of 1934 and the
>zoning regulations of Boulder County.

Sorry, but this is the United States, and the rights of the government are
limited by the Constitution, and not those of the citizens. The FCC does have
the power (subject to review by the courts) to make spectrum allocation
decisions, based upon public interest. When it fails to do so, you sue them.

The actions that you mention are mostly to prohibit criminal use of the
spectrum, which is consistent with public interest. Where it is not, lawmakers
have sought to redress (the various exceptions to scanner laws for hams).
The ECPA is bad law, and will probably wind up being deemed unconstitutional
when finally challenged. The Boulder County zoning stuff is clearly an
attempt to circumvent what has been called "overriding public and federal
interest" in PRB-1.

> Regards,
> Dube Todd
> "Rights without responsibility is a dangerous dissociation"
^^

Yes, and a little knowledge is a dangerous thing :-)

But these rights are what the country is based on. Unfortunately, and obviously, we cannot legislate away ignorance or irresponsibility. This is one of the risks/costs of a FREE SOCIETY. Therefore, I'm willing to accept it. The only alternative is a closed society.

Where do you draw the line at what's acceptable and what's not? Suppose that is different from where I draw the line - who decides? The easiest way is make it an all or nothing situation. Once the precedent has been set for SOME restrictions, others follow very easily - which is very scary in situations like the "Moral Majority" book bannings and burnings, and DWI checkpoints. As you say, "we can't have it both ways" - either we can receive EVERYTHING (which has no reasonable expectation of privacy) or NOTHING - just like cops either are NEVER allowed to stop you without probable cause, or can stop you to check for ANY potential crime (DWI, tax fraud check, pants on right). Look what this mentality has done for Iran. WHAT YOU ARE SAYING IS NO DIFFERENT!!! I DON'T WANT TO BE LED DOWN THIS PATH.

ECPA opens the door for OTHER SIGs (Special Interest Groups) to request additional restrictions. Tomorrow it could be illegal to receive ANYTHING except TV or commercial AM/FM radio. We could require that all receivers be licensed and incapable of receiving anything other than what is authorized. Maybe we need door-to-door spot checks to make sure everyone is complying. Begins to sound a lot like communism, doesn't it.

Yes, anyone can (legay under Comm Act of 1934, not so under ECPA) listen to cordless phone conversations. Very easy to do so.

What is NOT legal in either case is DISSEMINATION (rebroadcast, gossip, etc.) or USE FOR GAIN of that information (i.e. a "dump into the public domain"). I don't think anyone on the net is proposing that.

It is, for some at least, fun and interesting to see what you can receive and see what they're talking about. Especially the military, which you and I pay for, and which holds the fate of the planet under its thumb.

Yes, this outrages me. But this is at the very root of all the freedoms we enjoy, and I think everyone should be outraged at thoughts like this.

I'm attacking the thought, not the person.

> We can't have it both ways. Think about it.
Amen.

Message-ID: <8911230807.AA04739@ucbvax.Berkeley.EDU>
Source record: 15339

I'm looking for some other Tentec Paragon owners who have, or are interested in, using the optional RS-232 port to control the radio.

I have an Amiga Computer and, although there aren't any `canned' interface programs (for the Amiga), to provide access to the Paragon, I've had reasonably good results by using a public domain terminal emulator.

I have documentation on the IBM (and `compatibles') BASIC program which Tentec sells and, have been using it to understand the format of the Status `word' (several bytes in length) that's supposed to come back from the Amiga. There appear to be inconsistances in the portion reporting the radio's operating frequency.

If anybody's had experience in writing/modifying a computer program to control the Tentec Paragon, I'd be grateful for thoughts/comments.

Source record: 15345

*cs.utexas.edu!asuvax!stjhmc!f1.n234.z1.fidonet.org!Jim.Grubs
*@tut.cis.ohio-state.edu (Jim Grubs) replies yet again:
(And this is all out of order from many different postings)

> Pray tell, dear Jim: what is the difference between Bob's posting of
> the frequencies of department store dicks and Radio Shack's selling
> the frequencies of all the police frequencies in the USA?

*In principle, none. In practice, the shop cop frequencies (combined with a
*handheld scanner) have a much more easily implemented immediate, practical
*use. When I was a police dispatcher, my chief had a rule: "We can't stop
*them, but we can sure is hell make them fight uphill for everything they get."

Yes, I have found this to be the attitude held by various police agencies
that I have run into also. They care very much about catching the bad guys
and they sometimes start feeling that ANYTHING they can do to further that
goal is "ok". This includes harassment, restricting civil liberties,
"interpreting" the law to their advantage, etc., etc. I understand the
frustration they have and sympathize with them, but I still can not condone
the liberties they sometimes take with the freedoms of law abiding citizens.

I think that your postings on the matter of publishing the frequencies
(and listening to) any type of law enforcement activities is a reflection
of your former Chiefs advice. I.E. I can't STOP them but I can sure give
them HELL (read: harass) for everything they get. Instead of petitioning
the government or trying to change the policy of "Freedom of Information"
from the top down, you have decided to approach it "from the bottom up",
the result being that you attack, belittle and bemoan all those that while
abiding by existing laws, don't happen to support your view of what is
moral or "right".

The facts are that these frequencies are published by commercial activities.
The fact is that the government itself will supply this information to any-
one that asks (and that in itself is a pretty strong indication that they
feel it to be legal).

> How in the hell will listening to security guards catch petty thieves aid
> the thieves in getting away?

*If you are the shoplifter, knowing the shop cop frequency is a helluva lot
*of help.

And if a shoplifter uses a scanner in the commission of a crime (or for the
purpose of evasion) he is guilty of a violation of federal statutes and can
be charged with same. You see we already have laws on the books that address
the problem, but you want to carry it a step further than that and start
restricting access to information for the general public. This was addressed

in the "Freedom of Information" act and while you may not like it, it IS law. Please cite cases where anyone was charged and convicted of distributing "illegal" frequency lists. You see it does not matter how YOU interpret the law, it matters how OUR COURTS interpret the law. You are NOT judge, jury, and executioner, but you ARE pretty effective at giving people a hard time and that goes back earlier to what I said about "various police agencies".

> Right on. Was he trying to say that I don't have the right to listen
> to E&M radiation that somebody has SENT RIGHT THROUGH MY LIVING ROOM?!

*Listen to the "radiation" all you want. It's the message content I'm
*concerned about.

Be "concerned" all you want, but don't try to FORCE that concern on others, and when they don't agree call them "snoops" and "eavesdroppers" and accuse them of having "bad manners" etc.

*You're snoops and I'm a fuddy duddy for not approving your bad manners.

"Snoops" in your mind only, "bad manners" in your mind only and if you will notice, no one was calling you names of any kind. You are the only person that is attaching labels to people for what they happen to believe in, although I admit that there was a reference to "fascism" in one message after you attacked that poster.

I do not like to see this wonderful information asset that we have reduced to a tool for making personal insults and "to the death" verbal battles. It seems that this net is forever waging war on one thing or another and sometimes the results are interesting and sometimes they are rather offensive. To those that found my reply to Mr. Grubs distasteful please accept my sincerest apologies. I realize that now I am part of the problem instead of being part of the cure. :-(Oh well.....

Date: 1989-11-22 21:22:28 UTC
From: gb@sunpix.UUCP
Message-ID: <1007@greens.UUCP>
Source record: 15303

Can anyone give me the specifications for a NEC UPC1651G? I understand from the All Electronics catalog that it is a wideband RF amplifier, with 19dB gain and 1200MHz bandwidth. I'd like to know the noise figure at HF and the 3rd order intercept (or the 1db compression point, or the maximum standing current, or some parameter from which I can estimate the signal handling capacity). They are selling these things for $0.50 each or 100 for $35.00. I'd like to know if they're some good before I buy them.

>how exactly does a pi network or a T network transform a mismatched load
>into an apparently matched one?

Your best bet is to get a book on linear circuit analysis, or talk to some electrical engineers over there at HP. Basically, energy storage devices are used, because they store energy but do not dissipate energy (for ideal devices). The impedance of a Capacitor is -j/wC. The impedance of an inductor is jwL. The impedance of a resistor is R. Use Ohm's law, and Kirchoff's voltage and current laws. If the matching circuit is small (in terms of wavelengths) these techniques may be used, because radiation from the matching network can be neglected. If the impedance of the antenna is known, it may be matched to any other impedance. This may or may not be practical in your circumstance. These are all standard techniques, and every amateur radio operator should know them.

>IBM serial port (COM1 or COM2) using Turbo Pascal?

No, I haven't done either. I've never programmed an ACIA/PIA/serial port on an IBM PC; I have written code to control an 8250 in other special purpose computers. I have also written code to control Motorola chips. I don't use Turbo Pascal; I don't use any kind of Pascal - it's input/output capabilities are non-existant. I use C and assembly. However, I think I may be able to point you in the correct direction.

>I need to turn on/off the DTR and RTS lines (in order to

Interrupt 21h, function 44h seems to be the one you want. It is well documented in books like Peter Norton's Guide to the IBM PC. I would recommend this book (or the new version also including PS/2) if you are doing this kind of programming. I don't think this is the place to go into detail about techniques, however.

I'm afraid I have to disagree with you. Just because the constitution doesn't allow the president to fight undeclared wars doesn't mean he doesn't fight them anyway. And just because the constitution doesn't give the Congress the right to make committees and give the power of judicial review to the court doesn't mean they do that too.
And just the same way, just because the constitution or law doesn't say that you can receive and decode transmissions that enter YOUR house doesn't mean that you can't do it with YOUR OWN EQUIPMENT IN YOUR OWN HOME ANYWAY YOU CAN!
The point is that if the police or whoever wanted to keep people from listening in on their conversations, they should use spread spectrum or cryptography. And even there, there's always the chance that someone will be able to decode it. So unless they switch to a system that EXPLICITLY does not allow you to get the the signal in the first place (like cable tv or spread spectrum for example), I believe I have the right to intercept ANYTHING that enters my own home, and the only way they're going to keep me from intercepting it is to keep it from entering it in the first place. 73's,

Scanners/freedom to listen/etc debate
Comments, re: bad guys using scanners: I've asked several police officers while wondering how often they encounter bad guys that use scanners. The best reply was that if they were smart enough to use a scanner to commit a crime, then they probably are smart enough not to commit the crime in the first place. This makes a lot of sense, and seems to be the case in most things. As stated already, any of the information thus far published here and on other BBS systems (concerning VHF/UHF business/public service scanning anyway) is public information, and can be had through numerous "legal" sources, including the FCC itself. Freedom of information, you know?
Also, most police officers welcome the public's help, although madly pursuing calls heard on the scanner in order to "get involved" is not condoned. Several times I have had the opportunity to assist police simply due to the fact that I was 1) there and 2) aware (via a scanner) of what they were after. I never do anything that puts either 1) them or 2) me, in jeopardy. I think this is what most citizens would do anyway. As also stated previously, the police officers noted to me that they are very well aware of the fact that people are listening and that most are hobbyists like myself. They do not consider it eavesdropping, since they have secure communications available if necessary.
Thanks for the opportunity to throw MY 2 cents worth in!

If you are a user of the KA9Q Networking package, there is a mailing list you may join to communicate with kindred souls.

The primary orientation of the discussions is toward use of the package on Amateur (ham) Radio, but some of the discussions may apply to other uses.

To subscribe to the mailing list, send a message to 'listserv@ucsd.edu' (or whatever variation of that address is appropriate for you), with the text
subscribe ka9q-users
in the body of the message. You will receive confirmation of your subscription by mail, if our admittedly-stupid parser could figure out your message and return address.

Note that an earlier message in these groups mentioned the 'tcp group' mailing list; that is a technical workgroup mailing list and probably isn't what you were looking for.

This analogy stinks. If you don't want me to exercise my right to look into your car on the freeway, you tint your windows. If you don't want me to listen to the communications you are transmitting through my house because you aren't careful enough to send it directly, then you encrypt it.

You certainly have the right to say "This is none of your business."

However, you don't have the right to take away one of my rights in the process. Especially if your right is contrived to save you money.

I fail to see how my right to listen or look saves me any money. However, it may save my life and/or liberty.

42 MHZ dx
Re: police from CA on 42 MHZ- the frequencies you mention are allocated (in CA) to the California Highway Patrol (CHP). They use a semi-duplex system (eg: the mobiles and base are on separate frequencies). There's quite a scheme for allocating the channels, so I can't tell you the exact locations, but typically you'll hear a lot of highway numbers that, with a map, can tell you geographically where you are hearing. The only consistent identifier for unit numbers is the first digit(s) which signify the CHP office #. If you hear 'Mary', that means it's a 'motor unit', or motorcycle. The other alphas stand for other obscure things. E-mail me if you'd like the complete list.
The skip I hear from here, on CHP channels, is usually from the deep south and Texas and I have yet to identify where it's coming from!!

>privacy of their own home unless you break in and catch them in the act.

Bob, you're quite right. Unless, of course, the crime has a victim or witness in the house who is willing to complain to the police. They would have to establish "probable cause" before a judge who could then issue a search and/or arrest warrant. Then, and only then, does the Constitution allow the police to break into a private home without the permission of the owner. This is long-established American law, and I wouldn't have it any other way.

I live alone. If I listen to a forbidden frequency, who is going to know? How is the requirement for "probable cause" going to be satisfied? The fact is, it can't -- not unless you start loosening the standards for probable cause to the point where Constitutional guarantees lose all meaning. The Fourth (and Fifth) Amendments are specifically intended to keep the government from conducting "fishing expeditions", but a fishing expedition is the only way you could enforce the ECPA against someone who violates it from the privacy of his own home.

>Does that mean you can use illegal drugs, decode encrypted cable TV or
>tear the "do not remove" tags from mattresses with total disregard for
>the law?

It's interesting that you should mention drugs. As time goes on, I am starting to lean more and more in the direction of those who say that the "war on drugs" (and the competition between the dealers) are greater threats to the country than the drugs themselves.

I've occasionally tuned across the tabloid TV show "COPS". Judging from the show's ratings, the show depicts what most Americans probably perceive as a heroic group of fighters battling the evil drug menance. When I tune in, however, I often see highly questionable activities that, in my opinion, border on Gestapo tactics. Is it really necessary to severely penalize the use of drugs even when it's done in private? Do the ends always justify the means?

Apparently a lot of Americans think so. I turn pale when I read polls that show a majority willing to give up their Constitutional rights "if it will help the war on drugs".

Fortunately, unlike drugs, there has as yet been no hysterical public outcry against radio monitoring. If there were, I shudder to think of the consequences.

A metal-bodied airframe will act as a faraday shield, hence any RF radiated outside the airframe will tend not to make it to the inside except by passing through any non-metallic holes (windows, cockpit glazing). The internal avionics are therefore screened from much of the RF fields found outside the airframe. However, any RF generated INSIDE the plane is confined, and cannot radiate freely into space, so it hangs around trying to upset things!

Bear in mind that typical HF SSB airplane radios are able to put out several hundred watts. I dont know how efficient the antennas on a plane are, or how well they are matched, but i guess a fair amount of the RF actually gets radiated. However, hoping that the avionics are RF-proof, and using a HT/cellular phone is IMHO a risk. Electromagnetic compatibility and RFI-proofing doesnt come cheap, and we all live in a world where cost-cutting is a fact of life. RFI-filters are often the first to be omitted when building to a budget...!

FROM JUNK TO A JEWEL
or How I Listen to My Home Radio Receiver
While Away From Home

by Bob Parnass, AJ9S

One Saturday morning a few years ago, my wife Pam, N9HRZ, brought home 3 large gray steel relay boxes from a garage sale. She didn't know what they were, but was sure they were a "steal" at $5 apiece.

My examination brought disappointment. These 35 lb. "boat anchors" appeared to be something ripped out of a factory control system. The outsides were filthy, and someone had spilled oil inside of them.

Pam sensed my unhappiness with her find, so she offered to ask her dad, KA9CAI, to sell these boat anchors at a hamfest so we could get back some of the $15.

For a year, one box sat in my garage, and the other boxes two sat in my father-in-law's garage.

Junk Reexamined

Each box had a large hinged door, protected against the weather by a gasket. On the inside was a thick steel panel with about 8 DPDT relays, a time delay relay, and several toggle switches.

All relays were made by Potter & Brumfield, a top relay manufacturer. Each had a 117 VAC coil, 10 amp contacts, and was in a high quality Amphenol socket. The DPDT relays were enclosed in clear plastic dust covers, and had neon bulbs and resistors wired across their coils, which provided a visual indication of relay activation.

Components were wired together neatly to 2 large Bakelite barrier (terminal) strips. All interconnecting wires had terminals crimped on at the ends, so a screwdriver was the only tool necessary to service the unit.

Now for the challenge:

- I wanted a way to listen to my home radio receivers while I was away from home. Could this "junk" be

converted into a remote receiver controller?

I dreamed up a remote receiver scheme when back when I was presiding over our club at Bell Labs which operated on a poverty level budget. When the club telephone line rings, our controller:

1. Grabs the phone line by placing a resistor across it
2. Starts a timer
3. Connects the audio output of the remote 2 meter receiver to the phone line through an old phone patch

After the timer times out, the controller drops the phone line.

We had originally thought of modifying a telephone answering machine to serve as a controller, but our home-built controller proved cheaper and more reliable.

Time Delay Relay

The plug in time delay relay was a DPDT configuration, enclosed in a yellow cover. Instructions printed on the side revealed that the delay time was between 0.1 and 10 seconds, and was determined by the value of an external resistor.

Older delay relays use a thermal switch, which heats up over time, making or breaking contact after reaching a given temperature. Fortunately, my delay relay employed more modern circuitry. Inside was a printed circuit board with an actual solid state timer. The current Newark catalog lists this relay at $45, socket extra.

I wanted a delay adjustable between a few seconds and an 60 minutes. Not having a schematic of the timer, I applied 117 VAC to the coil and probed the circuit with a voltmeter. I found the capacitor that, along with the external resistor, determined the delay time.

A much larger capacitor was needed for long delays, but wouldn't fit within the relay case. I removed the original timing capacitor, and ran 2 wires from its old location to an external 220 ufd capacitor through a hole drilled in the case.

A Controller Takes Shape

I rewired the relays, and mounted a rheostat to set the timeout delay. The addition of pilot lights, 1/4" phone jacks, and modular telephone jacks complete the construction.

The remote receiver controller at IHARC requires use of an external phone patch to connect the telephone line to the receiver audio. We currently use a deluxe patch made by Waters.

Not wanting to tie up a phone patch for my home controller, I brewed up an interface to feed the audio output of a receiver to the phone line. It used a capacitor and 600 ohm transformer salvaged from a discarded PC board, and a varistor cut out from a telephone handset. The varistor clips residual voltage spikes that could appear on the telephone line from ringing voltage and damage the receiver.

The 35 lb. receiver controller works well. The only problem to date is that the timer was unstable. Sometimes it timed out after 10 minutes, sometimes after 20 minutes, sometimes .... I replaced the timing capacitor with a better grade component.

I use the setup to listen to a home scanner while I'm away from home. The scanner is powered from an AC outlet which becomes live when the controller answers a phone call.

The controller also came in handy for monitoring the NASA frequencies on shortwave during Shuttle missions. I connected the controller to my Japan Radio NRD-525 HF receiver and called it up from my office at work.

During Hurricane Hugo, I set up the controller to monitor the Hurricane Net on 20 meters and gave out my phone number to coworkers with relatives living in the affected area. They could call my home and listen to 15 minutes of hurricane news more current than reports available from the press.

The "Junk to a Jewel" controller is connected to spare phone line. I wouldn't connect it to my main telephone line without adding a circuit that waits for several rings before grabbing the line.

4231. Listening between 29.7 and 30 MHz - Russian aero?

Newsgroup: rec.ham-radio
Date: 1989-11-23 17:12:38 UTC
From: parnass@cbnewsc.ATT.COM
Message-ID: <5011@cbnewsc.ATT.COM>
Source record: 15356

x
The band between 29.7 and 30 MHz receives almost no
coverage in the radio monitoring press. This may be due
to several years of poor propagation and unreliable
reception. This year, however, propagation has been
great, and listeners in the US can hear several
interesting, albeit difficult to identify communications
in that band.

Spanish language communications can be heard on FM
repeaters, like on 29.9 MHz, for example. I can hear a
dispatcher speak in an Eastern European language on 29.86
MHz USB.

Anyone else heard what sounds like Russian aero military
traffic using USB above the 10 meter ham band? By
agreement (WARC '79) the spectrum from 29.7 - 30.005 MHz
is allocated worldwide for fixed and mobile use only.

The language I heard could be Russian or other Eastern
European, but not French, Spanish, German, or anything
spoken in the Americas or in Asia.

Some of the stations sounded like they are transmitted
from an aircraft due to the ever present (400 Hz?) whine
on their signals. Net control was the strongest and had
no such whine.

29.9350 call?_____unidentified: air to ground comms,
sounds like Russian language, usb, 11/23/89

Source record: 15357

NEC uPC1651G "Silicon monolithic bipolar integrated circuit"

I just put together a circuit using that IC from All Electronics.
(A spec. sheet comes with it). Gain is flat out to ~300 MHz, peaks
around 700 Mhz (+23 dB), and drops stone-like beyond 1.1 Ghz.
Anyway, below 300 Mhz it's +19.5 dB +/- 0.5 dB, at 5 V, 20 mA.
Noise figure is specified 5.5 dB typ, 6.5 dB max at 500 Mhz, but
I didn't measure it. Not the best low-noise preamp around!

Power gain is specified at 16 dB min, 19 dB typ (500 Mhz).
Max. output spec. as 3 dBm typ, 5 dBm max (500 Mhz). At 200 Mhz,
I measured 1 dB gain compression at 0 dBm output, with 2nd harmonic:

Fundamental 2nd Harm.
0 dBm -10 dBm
-10 -28
-20 -56

Hope this helps! -- John Beale, N8JUF

> -- service hints?
> &tc.?
>
> 73 de ke8yy
> Mike Edelman

I have owned a Corsair II for about a year. I am primarily a CW op,
interested in contesting and DXing. From my perspective:

Corsair positives
- Passband tuning is real nice.
- 3 filters selectable (most xcvrs only have wide/narrow).
- Tentec service is the best -- fast, inexpensive, reliable.
- No PLL phase noise (no PLL).

Corsair negatives
- Main tuning know has terrible feel to it. I think it's string
driven. Sometimes there's backlash, and the tuning is very touchy
due to 20KHz per dial revolution.
- CW sidetone has a mushy sound, and gives the effect of heavy weight
in the keying, which is not at all pleasant at high speeds.
- The IF filters are only 6-pole, not as steep-sided as on most rigs.
There is noticeable leakage around the CW filters from signals that
are 2 or 3 KHz away.
- You need to buy optional remote VFO to operate split freq. The
combination of Corsair, VFO, and power supply takes up lots of desk
space.
- The CW offset is set at 750Hz, too high for most people. Thus you
end up always using RIT. You have to remember to go on the minus side
with RIT on 160, 80, and 40, and on the plus side on 20, 15 and 10.
- Power output is less than 100 watts. It's fine with my Titan linear,
but I can't use it to drive my homebrew 4-1000.
- Part of its high-SWR protection strategy involves tripping a circuit
breaker in the power supply. Sometimes this breaker trips with as
little as 1.5/1 SWR. This is a real hassle if you try to adjust
an antenna tuner with full output, or if your antennas aren't
perfectly matched.
- I don't like the AGC action at all. It clicks on the leading edge

of a strong signal, and the trailing edge is very abrupt.
- The gain distribution between the RF, IF, and audio is such that there is always an audible white-noise hiss coming from somewhere that doesn't disappear if you remove the antenna. In other words, there's too little RF gain, too much IF gain. This may have been done to give the front end better strong signal handling capability, but I don't like to hear the hiss.

In summary, the Corsair II is not a bad little rig, but it is an old design which doesn't have many of the features of the newer rigs, and it has a number of little annoyances that I have noted above.

ARF DOES 313

It is with pleasure that I announce the additon of 14.313 to
the schedule for the Amateur Radio Forum.

ARF is a curent events discussion net where no topic is too
hot to debate. We have been meeting on 75, 40 and two
meters for three years and decided, we could do no harm
adding ARF to the bedlam on 313.

If you are interested in what's going on in the world and
are looking for a place to vent you spleen, and haven't been
able to participate on the 75 meter net, join us on 313.

The tentative schedule is:

Mon thru Fri 10:00 AM CST 14.313 USB

If you would like more info and a copy of the ARF news
letter, send SASE to

Jack Schmidling
4501 Moody
Chicago, 60630

Interesting comments from Mark. Over here in the UK the law lets you
listen to licensed radio amateurs, licensed CB operators and
broadcasters AND THAT IS IT. I believe the basic letter is 'if its not
meant for you, you mustn't listen to it'. (UK readers of the list
please correct me! ;-). How would Jim (or anyone else on the list)
like our situation?? I'd be interested to know. Bob is obviously
'on the ball' when it comes to monitoring, mods to radios, etc, as
we can see by his prolific postings, and while most are not of much
use to me, I still find them fascinating. Keep it up!!

> Can any one suggest the network best suited for antenna-matching and perhaps
> briefly explain why and how these networks can transform impedances and perhaps
> how one might go about home-brewing his own??

The most practical matching network for matching a wide range of unbalanced
loads to 50 ohms is the tee network. Schematically it looks like

```
----- X1 ------------ X2 --------
|
Zg X3 Zl
|
---------------------------------
```

This works best when X1 and X2 are the same type of reactance, and opposite
of X3. Usually X1 and X2 are capacitors, X3 an inductor, which makes
the overall circuit have a high-pass filter frequency response. If
X1 and X2 are selected to have capacitive reactance of ~100 ohms
at maximum C, and X3 ~100 ohms at maximum L, you'll be able to match
loads anywhere from 1 ohm to over 1000 ohms at some combinations of
the 3 reactances. Somewhere I have a C program which cranks out tables
of Zl for 50 ohm Zg while sweeping X1, X2, and X3 over their ranges.
I can dig this up and email to you if you're interested.

A friend of mine bought a Yaesu FTC-1143 HT, and the friend he bought it from had lost the programming instructions.

If someone out there can mail them to me, it would make Jason very happy.

It seems that Yaesu and many of the dealers don't want to give out this information for some reason.

Thanks!

>73 de Jim Grubs, W8GRT

While it is conceivable that someone may use a scanner to assist common shoplifting activities, it seems doubtful that a significant percentage of shoplifters would employ such techniques. I'll use a parallel. In NY State, there is a section of Vehicle and Traffic Law (397 if memory serves me well), which makes it a misdemenor (NOT a traffic violation) to have an operable scanner or radio receiver capable of receiving police frequencies in a motor vehicle. The law was apparently justified as a means of prosecuting people who use scanners to evade police in traffic (and criminal?) matters.

The parallel is that the legislature thought people would use radio receivers to evade traffic enforcement, or perhaps to evade police in criminal matters. Additionally, (somewhere) there is federal leglislation which says to the effect that the use of radio equipment in the commission of a crime is also a federal offense.

The irony of all this is that the predominant use of section 397 is in eliminating "call chasers". One deputy told me he had a car appear in the vicinity of three jobs in one night. He pulled the car over, and found a scanner in the vehicle. This apparently is principle use of the law in NYS (at least according to an undersheriff and an Asst. DA).

In my research on this law, I also found out that there were very few cases where radios were used in crimes, with the exception of CB-type radios used for communication, usually in home and business burglaries. Therefore, I submit that the publication of store frequencies would unlikely result in their use for illegal activities. Furthermore, if one were to use a scanner to monitor the store detective frequencies, and were apprehended,

it is possible that additional charges (the federal statues I can't cite off the top of my head) would be made.

...and about the NY law...the reason I looked into it is that most new ham equipment is capable of receiving VHF and UHF police frequencies. Ham equipment is exempted in the law...but only when capable of use on exclusive ham frequencies. If keyboard entries permit the receiver to tune a police frequency, then...well... I hope they aren't after you. Furthermore, 900 MHz equipment may not be expempted, as an example, because the 900 MHz band is not exclusively allocated to hams. [If enough people want, I can write more on this law, including the text...]

4244. Weather Facsimile Reception

Newsgroup: rec.ham-radio
Date: 1989-11-24 23:02:05 UTC
From: don@aeshq.UUCP
Message-ID: <341@aeshq.UUCP>
Source record: 15367
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I have been an occasional shortwave listener for several years, but haven't been very active for a while. Recently, however, I saw some information on weather facsimile reception in rec.ham-radio that got me interested this area (as a one-time meteorologist and a sailor, I'd love to be able to get current weather maps while I'm sailing).

Could someone please tell me:

- what do I need in the way of a receiver; for instance, is a Sony 2010 suitable or do I need a more expensive system? Some of the specific issues are direct SSB reception like the 2010 or a BFO (like the Sangean 803A?), tuning increments, width of reception window; there are no doubt others I know even less about!

- what sort of demodulator can I get; all the ones I see at my local ham shop are really for packet radio and do fax on the side. I've heard about ones from someplace called A&A but the people at the shop had never heard of them. Also, what do they need by way of a port and software on the PC? I don't mind putting a kit together or hacking some software, but not too heavy duty!

- WEFAX satellite imagery has also been mentioned; what radio, demodulator, port, and software do I need to get this as well?

This should do for starters. Please respond by mail; I will pass info along to others who are interested (mailer willing).

I was wondering just how well a 2M 1/4-wave whip would work as a
3/4-wave 450 MHz whip, so I plugged it into my MiniNec-type program.
Turns out that the radiation pattern is pretty strange--like a peak lobe
about 35 degrees in elevation. Of course, whether this is acceptable or
not depends on your situation... Antenna seems to load up nicely on 450
MHz, but then again, so does a dummy load...

UNLIKE most of alt.flame, this discussion has merit. I just hope we don't get into the act of flaming. So far, I have seen that my opinions are different than those of Jim Grubs, and more like Neal's (of lynx.uucp).

This affects amateur radio operators because they need to know and understand the differences in the political climate of opinions that they very own regulations are being controlled by.

I happen to believe Jim Grubs' analogy of the car on the highway does NOT match the situation of radio waves traversing my property or person. So I am benefiting from this by being more prepared to deal with others (such as FCC or Congress) who might also try to use the same flawed analogy. Anything left unchallenged ends up being accepted as if acceptable to all, so I need to be able and ready to challenge what I disagree with.

On the other hand, Jim Grubs will be more prepared to defend his position and analogy by hearing the accusations against it. In the end, hopefully, as long as we all stick to sensible discussion, and NO FLAMES, we might all at least learn a little more, even if no one's opinion changes.

Well... since I am at a point where I am preparing to equip my Jeep Cherokee with radios to cover 144-148 (rcv 138-174), 220-225, and 430-450 (rcv 420-470) Mhz, maybe you could tell me about the Ten-Tec radios that cover all these frequencies. Have you actually used them before? How is their service of VHF and UHF mobile radios? I'm glad to hear than an American manufacturer has finally gotten into the lucrative VHF/UHF ham mobile market. When are their 50 Mhz, 900 Mhz, and 1240 Mhz models due out? And what about HT's?

You know what I mean :-)

> Bob Atkins

Consumer removal of the tags from mattresses is LEGAL. I do it all the time.

There are MANY things that bad laws have been written to make illegal. IMHO you should be able to do any of those things in the privacy of your home as long as the way you do so does not infringe on the rights of any other person. As a civil libertarian I favor legalizing many many things, from receiving any radio signal that passes your property or person (vehicle on public property included), to legalizing abortion, drugs, guns, prostitution, etc. Yes, there are laws making things illegal, and those wanting laws to make other things illegal. I believe all such laws are bad laws.

So far I have not yet heard of anyone who is proposing to make it illegal for the consumer to remove the tags from his/her own mattress, but if you do hear of anyone suggesting this, please let me know. :-)

>is that it can be easily assembled & dismantled again. I dont have access to
>a lathe anymore, or I'd build myself a discone with quick-disconnect features.
>
> ++Pete

Pete, I have been using the RS Discone for about 4 months now my on packet mailbox on 145.07, the local voice repeaters, and sometimes on 440.

It works just fine, omnidirectional, SWR as advertized (about 1.5 or so on the ham bands...)

I like the idea of having an antenna that works on all those frequencies. It ain't gain, but I can use it on 145, 220, and 440 (I don't have 902 or 1270 at this time) or use it with scanner, etc.

I found one accidentally at a RS retail outlet a couple of days before a field exercise in which I was planning to use my dual bander. I bought it at the too-high-price, then was pleasantly surprised with the performance.

Try one-- all things considered, it's a neat thing for them to have. The price is a bit high, but not ridiculous.

* UoSAT-D & E NEWS *

In a surprise move last week, the launch of the UoSAT-D & E spacecraft and the Microsats has been brought forward to 09 January 1990 - due to problems with the SUPERBIRD satellite that was scheduled for launch in mid-December. UoSAT-D & E are now undergoing pre-flight preparations before being shipped (with the launch integration team) to Paris on 30 Nov and then Kourou on 01 Dec in readiness for mating to the ASAP on 12 Dec.

UoSAT-D & E have completed RF tests in the screen room at UoS and have been exposed to low temperature tests in the Clean Room 'freezer'at -20 C. Marc Fouquet, designer of the CCD camera on-board UoSAT-E, has been taking 'bench-mark' images for comparison with orbital images. Totally 'black' images have

been collected to provide data for image processing using the Transputer Data Processing Experiment - also on UoSAT-E in collaboration with the European Space Agency. The additional solar simulation tests planned for next week have had to be cancelled due to the advance in departure date, and the spacecraft are now undergoing final cleaning and assembly in the Clean Room. Uplink & downlink calibrations in an RF anechoic chamber are planned for next week - providing that the chamber can be made available within the very tight schedule. Numerous visitors from several countries (as well as the UK) have recently come to UoS to view the new UoSAT spacecraft.

* NEWS FROM JAPAN *

Japanese Missions: MUSES-A and MOS-1B

ISAS (Institute of Space and Aeronautical Science) plans to launch MUSES-A, a Mu Space Engineering Spacecraft, on January 23 or later, which will attain a swing-by orbit of the moon, following an orbit synchronized with the period of the moon and changing its orbit by using the gravitational pull of the moon upon passing by.

NASDA (National Space Development Agency of Japan) plans to launch MOS-1B, a Marine observation satellite, on February 1 or later, which will observe oceanographic phenomena, in particular the color and temperature of the ocean surface. The satellite will be launched by H-1 rocket into a Sun-synchronous subrecurrent orbit at an altitude of about 900 km.

4252. Seeing in the dark (sort of)

Newsgroup: rec.ham-radio
Date: 1989-11-25 04:04:08 UTC
From: ee5391aa@hydra.unm.edu
Message-ID: <1018@ariel.unm.edu>
Source record: 15369
Cross-posted to: sci.electronics,rec.ham-radio

Yew electronickers out there take notice -- this might be useful.

Prices on infrared motion-sensor outdoor lights have dropped down to the $15 (sale) level here in Albuquerque. I picked one up back when they were stable at $17 (Price Club) and took the controller apart to play with it.

The meter probes showed about 16VDC running around in there, and subsequent experimentation had the thing working just fine on 12VDC.

Of course, the triac was no longer in the circuit (hard to turn off on DC) and the 110VAC->16VDC circuitry was bypassed, but placing an LED in place of the optocoupler made for handy experimentation.

I'm convinced that we have here the basis for a hard-to-defeat (hard-to-detect, even) space alarm. You have to have a unit which has a sense position that isn't shut down in daylight, but all the ones I've worked with (all two of them) had that capability.

Replacing that LED with a resistor and the base of an NPN transistor, and putting a 12VDC relay in the collector circuit gives a handy combination: I'm in the process of mounting that in a box. A modular motion-sensing switch, which runs on 12VDC and can be moved around quite conveniently, offers possibilities to me. A sensor for wildlife photography, a coyote scarer, a portable trail or road "eyeball",...the mind boggles.

I think I'll take it down to the next cavers' regional get-together, and put it in the camper on my truck, driving a Radio Schlock 49-489 piezo siren. That's one LOUD siren, folks. Check it out.

Think about it. What would YOU do with such a device? Tell the net. We're listening....

Click, click, ZAP!

Just to show how REALLY sick and perverted I am... Has it struck anyone else how easy it would be to put some serious power on these frequencies and what the reaction would be when "baby" started asking someone to PLEASE change the channel on that radio? Or asking "Hey I'm hungry... when do I eat?!" or... MOMMY MOMMY... COME QUICK I DID A BOOBOO!!

4254. Antique Newsgroup?

Newsgroup: rec.ham-radio
Date: 1989-11-25 17:17:48 UTC
From: adams@swbatl.UUCP
Message-ID: <983@swbatl.UUCP>
Source record: 15378
Cross-posted to:
misc.wanted,misc.consumers.house,rec.woodworking,rec.ham-radio,sci.electronics,rec.arts.books,soc.culture.misc,news.groups

Is there, a newsgroup appropriate for the discussion of antiques and
collectables? If so would somone please direct me to it. If not, are
there others interested in starting a mailing list?

My interests include antique radios, books, and books about radio as
well as furniture restoration, auctions and collecting trivia.
There seems to be a few people in rec.arts.books interested in book
collecting, a few in rec.woodworking interested in antique restoration,
and a few in sci.electronics interested in antique radio and radio history
but no forum dedicated to the (admittedly limited) audience for these
topics. Perhaps they could coexist in a mailing list. I will volunteer
to run said list, at least at the beginning.

Any interest?
Send mail to uunet!swbatl!adams or adams@swbatl.swbt.com
please have the word antique in the subject line. The perl
mailing list is swamping my in box :).

The PI network also works well, and I believe that for most cases of
matching a low impedance load (30 - 70 ohm antenna) to a high impedance
source, the PI network works out to be a low pass filter. PI networks
were used almost exclusively for tube type final amplifiers in the not
so distant past. [My HF IF strips all have tube type final amplifiers (I
don't operate on HF anymore, so they are all IF strips).]
The PI network looks like the greek letter PI:

```
-----+----- Z1 -----+-----
| |
Zg Z2 Z3 Zl
| |
-----+--------------+-----
```

4257. Re: RS Discone? Good or Bad?

Newsgroup: rec.ham-radio
Date: 1989-11-26 00:07:34 UTC
From: psfales@cbnewsc.ATT.COM
Message-ID: <5038@cbnewsc.ATT.COM>
Source record: 15382

In article <23.Nov.89.14:09:15.GMT.#6683@UK.AC.NWL.IA>, PJML@IBMA.NERC-WALLINGFORD.AC.UK (Pete Lucas 0793-411613) writes:
> Anyone got any comments (Good? Bad?) on the RS Discone antenna? I am needing
> a portable antenna for covering 86, 144-147 and 169-173MHz. Important thing
> is that it can be easily assembled & dismantled again.

Well, I am not particularlyl knowledgable about antennas, but I have the RS Discone and have been reasonable pleased with it. I purchased it because it met my three major constraints: reasonable price, covers the 144 and 440 MHz bands, and would find inside my attic.

However, I am not sure how well it fits your constraint of being easily dismantled. I foresee two problems: 1) The antenna is held on the mast with three tiny screws which are easily lost and a little hard to start. This might not be a problem for portable operation, since you might not even need to use them. (The coax feeds up the inside of the antenna and would do a fairly good job of holding the antenna in place.) 2) The eight "Cone" elements are hollow aluminum tubes which strike me as being a little flimsy for rough service and repeated assembly.

Neither of these complaints would be a problem for a fixed station.

4258. What's a good "FCC class B" PC/AT clone?

Newsgroup: rec.ham-radio
Date: 1989-11-26 00:57:52 UTC
From: elmquist@NIPS.SSESCO.COM
Message-ID: <8911252258.AA00191@nips.ssesco.com>
Source record: 15385

Just wondering what types of clone PCs people are using and what
kinds of problems they are finding with RFI from said boxes?
My recent expedition to local stores found plenty of chassis with
"CLASS B" certification that produced S9/+60 noise on my 2m HT at
5' or more distance... I'm sure the chassis was CLASS B *before*
they put the computer in it... it cer
they put the computer in it... I'm looking for a 20 or 25 MHz 386
ideally... but may have to settle for a lower speed box since the
higher speed ones appear less likely to meet CLASS B. Anyone have
any recommendations?
73, Chris N0JCF

4260. Oldtimers: TV Ads Save Amateur Radio?

Newsgroup: rec.ham-radio
Date: 1989-11-26 06:46:52 UTC
From: kg19+@andrew.cmu.edu
Message-ID: <AZPsPQG00WB6EekdZv@andrew.cmu.edu>
Source record: 15384

I seem to remember in my very early youth (12 years or younger, I can't remember exactly) there were a series of TV ads for Amateur Radio. I saw them before I knew what Amateur Radio was, but I still remember them and I think at least one of them starred Dick Van Dyke. Do any "oldtimers" remember these?

What I am wondering is A) who sponsored these (ARRL?) and B) why were they run at the time? Was there a lull in membership back then too? Do you think TV or radio ads would do anything today? Are they even affordable today?

The Radio Shack discone antenna has worked very well for me. I have it mounted on a 20 foot mast attached to the chimney on my one story house. I use it both with my PRO-2004 scanner and as a transmitting antenna with my 25 watt 2 meter rig. I am able to bring up repeaters about 100 miles away with this setup. As a receive antenna used with the PRO-2004 it is great. The wide bandwidth matches that of the scanner. So far the antenna has performed well for me across its advertised bandwidth.

I guess you could disassemble it and use it as a portable if you don't mind unscrewing the 16 rods that make up the disc and the cone.

Hello,

I am interested in getting more information about transverters that work with an HF rig. What VHF/UHF bands can be used? What are some of your personal experiences and comments on them? Who makes them and how can I get in touch with some of these dealers/manufacturers? What I really want to do is add 2 meters (some form) with my Icom IC-740. It is capable of working with a transverter. It might also prove convenient to get access to 50, 220, and 450 MHz, I don't know. Right now, I know next to nothing about them and have had a hard time finding information. Any good articles in past 73's, CQ's, Ham Radio's, or QST's?

Any and all comment would be *GREATLY* appreciated!

Thanks in advance!

Mark.

Message-ID: <Nov.26.14.13.23.1989.13175@hardees.rutgers.edu>
Source record: 15387

I am more than a little confused with all the talk over so called
scanner laws. I once saw a copy of a senate bill from the state of
NJ. stating that the only people in the state permitted to have a
scanner in their cars was rescue workers and hams with a Tech license
or higher. Now I hear that isn't the case.
I am planning a long road trip from N.J. to Florida in about a month.
I would like to bring my H.T. along (receives police and fire as well)
and I am wondering what various state laws are as of now on this
matter.
The states I am in need of info for are

New Jersey
Delaware
Maryland
Virginia
North Carolina
South Carolina
Georgia
and Florida.

Any info would be most helpfull

Thanks in advance,

>of Zl for 50 ohm Zg while sweeping X1, X2, and X3 over their ranges.
>I can dig this up and email to you if you're interested.

A very good technical note appears in the Motorola RF Databook (Vol 2) AN721.
To explain how you get a change in impeadence, first put a reactance, say
a capacitor C in series with your load R. Then do the mathematics to change
the (R-jXc) to (G+jYc). i.e. a series to parrallel conversion. looking
at it as a two-port black box they are both the same. When you do this
transformation you will see that the G value (conductance) is not the same
as simply 1/R !!! Thus if we resonate out the capacitive reactance that we
have added (Y) with a -Y inductor, our original R is transformed to 1/G.
This is one of the simplest L-matching networks. Other types, Pi etc help
with broadbanding and cam be made to work over a larger range.

I have had the same experience with a 144MHz handheld, though it only happens when the radio is within about three feet of the computer. It appeared (though I didn't want to experiment too many times trying it out :-) that the power supply was shutting down while the transmitter was being keyed.

In article <24.Nov.89.14:59:49.GMT.#7127@UK.AC.NWL.IA> Matt Brunton writes:

>.....Over here in the UK the law lets you
>listen to licensed radio amateurs, licensed CB operators and
>broadcasters AND THAT IS IT.

Do you thin this is GOOD? If you do, I feel sorry for you.....

Just another reason for me to think that England is a police state. This may not be ther proper forum, but then again maybe it is....I will let the readers decide.....

England seems to have many laws that classify it as a police state: No right of free speech, very restrictive gun laws, an oppressive "Big Brother"-type government, high taxes.....and now I find out this: you cannot even listen to radio waves passing through your own body!

Did you hear the recent story about how the English government gave the environmental group Greenpeace a hard time? You may not agree with the politics or the actions of Greenpeace, but the story tells much about how the Police State in England operates.....

It seems that Greenpeace was trying to promote their new record album called "Rainbow Warriors". All the procedes go to help Greenpeace fight for their environmental concerns. Several English rock stars are on the album, and they wanted to air commercials in England for the album.

Well, the English gov't took issue with this. Then they forced Greenpeace to follow certain "guidelines" set up especially for the advertising of the Greenpeace album: the ads could NOT suggest that the artists supported Greenpeace, could NOT use the words "Greenpeace", "green", "tree", or "whale"! The artists could not even SUGGEST that they were concerned over the state of the environment! According to the English gov't, it was all too "political".

Now, contrast this with the SOVIET UNION, where there were NO such restrictions set up by the government.

According to Ian Flooks, a media promoter in London who helped Greenpeace with their legal battles, "I began to wonder who was living in the police state".

>How would Jim (or anyone else on the list) like our situation??

If you cannot tell from my above posting, I will spell it out for you:
I think it stinks! Now, you did not post what YOU think about the situation... do you agree with it, or does it make you mad? Why don't you work to try and change it.....but, I suspect that not enough people in England care about the situation.

Neal

4270. My Father Talks to Hams (HUMOR)

Newsgroup: rec.ham-radio

The following is a true story:

It was about 17 years ago and I was in the second grade at Washington Street School, in West Orange, New Jersey. The weather was rainy, and all the students had to stay indoors during lunch time because of the bad weather, except those who went home for lunch.

After eating lunch in our classroom, the teacher left and we were left alone in our classroom. We were all talking amongst ourselves when the subject of hobbies, sports and fathers came up. Some of the students explained how their fathers watched sports on television, and followed the progress of different teams as a hobby, and even went to a few games on the weekends.

Then, one of the students turned to me and said, "John! What team does your father like??". "Oh, my father could care less about sports", I said. "Well, what does he do in his spare time?", someone asked. "He talks to hams", I answered.

At that point silence fell over the entire classroom and every student began to stare at me as if I were from the planet Xenon! After a few seconds of thought, Gina S. broke the silence and tried to "save" me from looking like a fool. She turned to one of the students and said, "Well, you talk to a dog? His father talks to hams!".

Gee Look at all this bandwith... Gee Was the Fido gateway invited? Or
are they "eavesdropping" on USENET? Just who authorized this monitoring
of our postings anyway? :-)

Lighten up Jim, Im not sure about the FIDO users, but here on USENET,
we really done have that many criminals. Just "RADIO CRIMINALS", and
we're proud of it! You see we believe it takes a really small brain
for a body of lawmakers to vote somthing as absurd as the ECPA into
law. Its really sad when we get down to things like this here in the US.
One day the public will realize they got screwed , and fight it (I HOPE).

And Bob P., Let me take this opportunity to THANK you for your informative
postings over the years.

Far more good than anyone can tally up comes from the monitoring of
Municipal frequencies. If more people would constructively get involved
(not in the way), Far more REAL criminals would be caught. (but then
we dont have room to lock em up, but thats another problem,hihi)

Best Regards to you all de johnd/ka2qhd

PS
Better buy the little wife that diamond she always wanted, else she
might turn me in to "The Radio Police" for tuning across channel 77
on my regular tv tuner. :-)

Message-ID: <4623@netcom.UUCP>
Source record: 15406

The RS discone is far better than the inbuilt antenna but it still not quite enough, it seems.

I often monitor CHP in the SillyCon Valley area and find that I cannot pick up mobiles more than a few mile away. I also have never picked up the East COast skip that I get on the mobile in the low VHF band.

The cable is 50 feet of RG-8A/U which should not be too lossy at 50MHz and the discone is 67 feet above ground and 3 feet above the peak of the roof.

I have one particular gripe about this antenna: the connector is a SO-239 UHF connector. It is a bad choice for UHF work. Better a N-type or BNC/TNC type connector.

4277. My backyard, your backyard ...

Newsgroup: rec.ham-radio
Date: 1989-11-27 07:41:30 UTC
From: die@cpoint.UUCP
Message-ID: <2942@cpoint.UUCP>
Source record: 15408

I have read the recent flurry of comments on the issue of one's
"right" to interpret the electromagnetic energy impinging on one's property
and have some questions about what is being said:

It seemed very clear to one poster that it was improper
to make use of services transmitted over the airwaves (such as pay tv) to which
one does not subscribe.

I find it hard to understand why if I have an absolute "right"
to interpret voltages induced across my backyard aluminum that that "right" ends
just because somebody has defined their communication as something I
must pay for. In essence if I have an absolute right to demodulate
what signals I find in my backyard or living room than it seems to logically
follow that there is no such crime (and yes people have been punished for it)
as rf signal piracy, at least as far as concerns private individuals making
private and incidental use of nominally pay-for-reception information streams.

And if I do not have a fundemental right to demodulate what shows
up in my backyard, then why is it not perfectly appropriate for Congress
to define certain essentially private communications as restricted in the
same sense as pay-for-reception transmissions are ? Is there some important
difference between assuring that the provider of a signal gets his fee and
and protecting the privacy of personal communications from casual
evesdropping ?

Why, in short, should I have a right to listen to your phone calls but
not watch HBO's video ?

And the fact HBO uses DES to make it slightly harder for me
to interpret their signal (because they use DES sloppily, not because it
isn't potentially effective) should or shouldn't make a difference in whether
I can watch it ? In other words if I can break encryption, can I use the
fruits thereof - does my "absolute right" to interpret energy in my yard
extend to even those communications protected by encryption if weak
enough so it can be broken ?

4278. Re: What's a good "FCC class B" PC/AT c

Newsgroup: rec.ham-radio

Whether or not the manufacturers are actually meeting the requirements of "CLASS B", I can also tell you that CLASS B is very inadequate for use in a hamshack.

I recommend either using tightly shielded coax (meaning Belden 9913 or 9311) everywhere AND placing your antennas FAR FAR away, or building your own system from those CPU motherboards you can buy (from Jameco and others) and put it on your own real Faraday cage. If you hunt around you can even build your own system cheaper than buying one complete.

My Denon cassette deck slows down to about half speed when I transmit on
220 Mhz near it. No noticeable effect from 144 Mhz or 440 Mhz. This deck
is the dual capstan type with something controlling the exact phase and
speed of each capstan independently to maintain the right tension. I guess
the 220 Mhz is wiping out that function.

By all means, jump in and make contacts! You will
be entirely welcome and will help out the "contesters."
It's a good idea to listen for a while to figure out the
exchange, but don't be afraid to just ask someone on the
air, either. By far, the largest number of QSOs made
by any hard-core contesting station are with non-contesters.

Have fun -

4283. Transverters

Newsgroup: rec.ham-radio
Date: 1989-11-27 11:03:02 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <8911280801.AA18720@ucbvax.Berkeley.EDU>
Source record: 15399

Mark -

Transverters are great for getting on VHF one
band at a time. If totaled, however, the cost of
single-band transverters for 50-1296 MHz can exceed
the cost of a multi-band box like the FT736. But
costly or not, they will generally out-perform the
currently-available Japanese rigs because they use
a high-quality low-band rig as the IF.

Which brings me to another point. You mentioned that
you want to run the transverters from an ICOM IC-740.
ICOM makes fine low-band rigs, but (as far as I know)
they ALL have very low (<0.5 mw) output from their
"transverter" jacks. I don't know why they do this,
because no transverter on the market will run from such
a low level. You will have to either (1) dig around inside
the rig to find a higher 10-meter level to drive the transverter,
or (2) build an external amplifier to bring the 10-meter
power up to the 10-50mw needed. What a pain.

Mike Owen W9IP

4284. Info required on BC-312 or 342 radio

Newsgroup: rec.ham-radio

Source record: 15420

I'm posting this for a friend who doesn't have access to the net.
He is Mark Evans (G0KFV), and he needs some information in order
to restore a BC-312 (or it might be a BC-342).

The radio comes from RCA, Hollywood, CA and was made in 1944. Mark
believes it was originally mounted in a Liberator bomber on duties
overseeing North Atlantic convoys in 1945.

The PA stage is operational, and all valves are present and test OK.
The big problem is that the dynamotor has been removed at some point,
leaving a collection of loose wires in the region of the VFO. Mark
needs the relevant part of the circuit diagram, and would appreciate
hearing from anyone who has it or knows where he could locate it.
He'd also like to know how to recognise a suitable dynamotor, or
failing that, what the spec is for its power output so that he can
build an alternative supply.

Any useful info would be gratefully received, including further
historical details. Serial numbers etc can be provided if required.
I'll pass on any EMAILs received, or Mark can be reached at:
16, Rosabelle Ave, Wivenhoe, Colchester CO7 9NX, UK.

Thanks in advance for any help.

4287. How to fix bugs yourself in my Hypercard Ham Stacks

Newsgroup: rec.ham-radio
Date: 1989-11-27 14:31:19 UTC
From: dls@genrad.com
Message-ID: <29250@genrad.UUCP>
Source record: 15411

This is a reposting of a previous posting that I made to describe how to fix minor problems in my Ham Stacks. I have had three requests for this data in the past week, so figured I'd repost it for those who are interested. For any who have (or may have in the future) these Ham Stacks, I suggest that you print this and save it, since these are general directions and not specific to any one of the stacks. Others can press 'n' now.

I do have specific corrections which I will make available via email for anyone who currently has version 2.0 of the Technician Ham Stack. If you wish a copy of this, please let me know. As for the on-line versions, Peter will be upgrading those as soon as I send that list of instructions to him as well (no, I haven't done that yet).

One more thing: If you DO find and fix any "bugs" in these stacks, PLEASE send me your corrections, so that I can fix my own stacks. Email the list to dls@genrad.com. I will need the Stack name (Novice, etc.), Stack version (found in Info), card name (or first word of question, like 2A-1.1, which is always unique), and a description of the problem. And THANKS!

There are three major types of bugs in these stacks: 1. Misspelled words in the question or answers, 2. Incorrect answer choice, 3. Incorrect card name, causing card to never be accessed.

To fix these stacks yourself (expert HyperCard users, please bear with me, this is written for an uninitiated user), first do the following (these commands can be done from ANY CARD in the stack):

1. Ctrl M to get the message box.
2. Type in the message box "set userlevel to 5".
3. Type in the message box "show menubar".

4A. To correct misspelled words in question or answers, first go to the card in question...you're probably already there....but if not, type in message box "go to card "#123"" (assuming you want card #123).
a. Pull down the Tools Menu, then choose Field (top far right ICON).
b. Select the field to fix by clicking in that field.
c. Pull down the Object Menu, then choose Field Info.
d. Unlock Text (click in the checkbox).
e. Pull down the Tools Menu, then choose Browse (top far left ICON).
f. Edit the text in the field as necessary to correct it.
g*. Repeat Steps a-c to get to the Field Info again.
h*. Lock Text (click in the checkbox).
i*. Pull down the Tools Menu, then choose Browse.
CORRECTION COMPLETE.
*(If you are doing a lot of typo corrections, it's sometimes easier to unlock all of the answers and question, fix all of the typos,

even on other cards, THEN lock all of the answers and question.
Just don't forget to lock them when you are done, or you take the
chance of inadvertently changing or destroying the text accidentally
while taking the test.)

4B. To correct incorrect answer choice, first go to the card in question...
as described in 4A above.
a. Go to card script, either by holding down Option and Ctrl keys,
and pressing C (only works with HyperCard v1.1 or newer), or
by pulling down Object Menu, then choose Card Info, then click
the Script button.
b. Edit the answer line as appropriate. To choose A as the answer,
this line should be in script:
put "A" into rightone
NOTE that the letter should be capitalized.
c. Press OK button.
CORRECTION COMPLETE (Note this correction will not actually
appear until the NEXT time you come to this card, so it's
not obvious that it has been fixed).

4C. To correct the card name....this one's more difficult. First you must
figure out what IS the right card name....unless you already know (ie,
I tell you). The symptom of THIS bug is that when you press the NEXT
arrow, nothing happens, but when you press the NEXT arrow a second time,
it goes to the question AFTER the next question. Pressing PREV arrow
twice will get you to the question BEFORE the bad question.
a. To determine the right card name, look at the question number of
the previous question (say 20), add one to it, then type in the
message box:
put item 21 of questlist
b. The correct card name will appear in the message box.
c. Now go to the PREVIOUS card (let's say the card you want is
#122) by typing in the message box:
go to card "#121"
d. Now go to the next card by pulling down the Go Menu, then
choosing Next. DON'T use the NEXT arrow at the bottom of the
card!!! You already know that doesn't work.
e. Pull down Object Menu, and choose Card Info.
f. Edit the correct name into the card field. It should be a
number sign (#) followed by the card number you want (if this
is the 10th card in the stack, the card name will be #8; card
name is always 2 less than its card sequence in the stack).
CORRECTION COMPLETE

5. The stack has now been fixed, and you don't HAVE to hide the menubar
and change the userlevel to use the test, but when you come back into
the stack for the first time after the fix, these will have been set
to their correct state. Here's how to fix these without exiting the
stack:
a. Type in the message box:
hide menubar

b. Type in the message box:
set userlevel to 1

As I said before, I will have some "fixes" that you can try your hand
at with the Technician stack shortly. Email me if you desire the list.

4288. Multiband mobile antennas

Newsgroup: rec.ham-radio
Date: 1989-11-27 14:53:47 UTC
From: davet@tsdiag.ccur.com
Message-ID: <639@tsdiag.ccur.com>
Source record: 15414

I have recently purchased a used Yaesu FT-727R handheld, which operates on both 2m and 70cm. I am quite happy with it, but I have a question about how best to 'antenna' it. A little quick math shows me that a 1/4 wave 2m antenna is approximately 20 inches long. This also happens to be 3/4 wavelength on 450MHz (more or less). What are the impedance and resonant characteristics of a 3/4 wave antenna? What's the rule: Even 1/4 wavelengths, odd 1/4 wavelengths? Both? Are there any antennas out there (for construction or, heaven forbid, purchase 8-)) that will give me reasonable SWR on both bands? (I hope to use this mobile, so a RS discone would be a little conspicuous.) Any ideas/pointers/vectors/ articles/etc will be greatly appreciated.

PS - Anyone know how to speed up the squelch opening time on this handheld?

Thanks in advance from:

Thanks to all of you who've replied to my query on RS Discone antenna.
I've decided not to buy the RS one - I've ordered a REVCONE (this is a UK
made version - stainless steel hardware, with a 'N' connector for the coax and
a tapped hole in the top so i can add a 1/4 wave whip for my favourite band.
Its no more pricey than the RS product, and of course theres nowhere for a
whip to fit on the RS one!
Will let the net know how it behaves. I dont know if REVCO products are
available in the States - methinks probably not.

Am I that old? I believe the adds were sponsored by the ARRL(don't swear to that one) but they were done by Mr. Van Dyke as a favor to a long-time associate (I think his manager) who was a ham. I believe the spots were done in the late 70's as part of the League's Tune-in-the-World promotion effort of amateur radio. Gee, everyone who blames the league about not attempting to grow our numbers always seems to forget that little effort? Seems thats about when we had the greatest spurt in our growth as I recall...I would guess they were aired as public service spots. As I further recall, you usually only saw them after 11:00pm ;-)

My two cents on FAX stuff.

I just got into wefax reception. I had NO background with SW radios, antennas or any of that stuff. However so far everything is starting to come together pretty good. My setup is :

the radio - radioShak Dt440 or something like that. Cost ~ 200

the computer - either my AT or PC the pc has a CGA LCD which is pretty bad for viewing but when i get it battery powered it'll be fine for traveling.

The AT is a Herc card and makes great pic's.

The demodulator is from Software Systems Consoulting(sp) in CA. They advertise in Pop Comm alot (at least the 3 issues I have) and it cost $99 for the demodulator and software. The demodulator runs on the serial port and the software runs under DOS.

My first antenna was the radio Shak long wire. From Phoenix I could get good pictures from San Fran. but not much else. I just bought a REAL antenna (name slips me at the moment) around 70 bucks and was tuned for the freq's I need.

Although I don't yet have a coax leadin from the antenna the pictures are MUCH better. I now can get Norfolk and Hawaii with no problem. The pics are great from CA and Norfolk although I still can't figgure out some of the Hawaii maps.

Currently I'm writing my own driver under QNX to allow me to capture maps and download them to other sites.

Well that's what I'm doing (sat pics will be later)

I'm currently seeking permits and in the market for a 50ft or so tower.
I've already decided on galvanised steel (rather than Al.), but being
unkeen on the prospect of tower climbing, I'm thinking of either a
tiltover or a crankup (telescoping?) tower. So questions:
1. Do all types of (triangular section) tower have to be climbed when
erecting them, even if they later tiltover etc..
2. What are the pros and cons of tiltover vs. telescoping.
3. Any other good alternatives for 50ft.

4296. DOSGATE - Update...

Newsgroup: rec.ham-radio
Date: 1989-11-27 17:16:06 UTC
From: rbono@necis.UUCP
Message-ID: <1178@necis.UUCP>
Source record: 15421
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Here is info on the latest version of DOSGATE:

The current version of the DOSGATE driver *should* now support
most any TNC. The previous version only worked well with Kantronix TNC's.

DOSGATE allows a PC (XT, AT, compatibles too) to be used from
a remote packet terminal. This allows *almost* any MS-DOS program that
is available on the disk drives to be run from the remote packet terminal.

"*Almost* any" does not include programs that bypass MS-DOS function
calls for terminal I/O, or (because of limitations of the remote packet users)
programs that require graphics, etc.

DOSGATE installs as a 'device' driver in place of the standard
ANSI.SYS driver, although (at this time) is does not support ANSI escape
sequences.

DOSGATE has been tested with Kantronix, and AEA TNC's at this time.
Hopefully more will be added to this list as users send me reports (Sorry,
I can't afford to own one of each type of TNC!).

What can DOSGATE do for you? Just about anything that you can think
of, and have/write the software for.... controlling things in your shack,
allowing access to a telephone modem, compiling programs, etc.

My DOSGATE system (NM1D-2 on 145.070 in Derry, NH accesable through
node SNH) has the following applications available to users via the packet
network (users include regular checkins from Canada to Arkansas):

SeeSats - Real time OSCAR tracking
AutoExam - Online Ham radio exams from Novice to Extra, can be
used interactivly or to print out written exams, full
question pools, each exam is randomly different.

AutoCall - Online callbook database (kudos to N7IKQ), look up
any call in the US (currenly limited by disk space to
the W1 call area, should contain entire US by December).

Games - Several INFOCOM 'adventure' style games that can be played
on-line.

Repeater database - Repeaters in the New England area which can be
searched by frequency, Town, State, etc.

Club database - Local radio club member database can be searched by
name, call, address, town, state, etc.

DOSMAIL - SIMPLE (local only, no autoforwading at this time) mail
system that works similar to other packet BBS's.

Misc - Several other databases, and programs too numerous to mention
here.

How to get DOSGATE for your area:

There is NO COST for the DOSGATE software if you use it for
Amateur Radio on-the-air applications. To get a copy send the
following to me:

1 Formatted 5 1/4 inch 360K floppy diskette
1 Self-addressed, STAMPED diskette mailer to
allow me to return your disk to you.
Your Name and Address
Your request for DOSGATE.

Send to:
Rich Bono
7 Redfield Circle
Derry, NH 03038

If you forget to include any of the above items, then your disk
will probably not be returned to you!!!

DOSGATE is not available via electronic transfer...

YES!!! Packet can be used for MUCH more than just email!!!

DOSGATE allows you to easily write your own programs and not
have to worry about the program to TNC interface.
Support a DOSGATE in your local area.....

Rich (NM1D)

4298. A Computing Decision: Apple vs. IBM

Newsgroup: rec.ham-radio
Date: 1989-11-27 18:12:43 UTC
From: KENDALLG@VTVM1.CC.VT.EDU
Message-ID: <8911280802.AA18984@ucbvax.Berkeley.EDU>
Source record: 15248

I'd like some general input from our fine studio audience here... 8)

Hopefully within the next few months I'm going to buy myself a decent PC system to use at home. In addition to the 'usual' software (word processing, spread-sheet, terminal emulation, etc.) I'd like to be able to use it for ham radio as well (like packet, station logs, etc.). My dilemma is whether a Macintosh would *really* be worth the extra $$$ in comparison to an IBM-compatible system, especially in terms of available 'plug-in' hardware boards (I guess I'd have to go with the Mac II for that capability). I've worked with both systems; I thing the Mac is more 'user friendly' but I haven't dabbled seriously enough with either system to know what they can really do (I have to buy something that my wife can use, too!)

Any input would be most appreciated. Thanks.

YES I do have a fundamental right, if not in current law, then in principle,
to receive ANYTHING that makes it to my property.

Until very recently, it was a recognized principle of law that personal
rights, especially personal rights that do not affect others, were
inalienable. This was exemplified by the concept of "fair use" for example.
Fair use says that the individual may use intellectual property for his
own private purposes without license or control. This concept is further
illustrated by the language in the Comm Act of 34 which established the
unfettered right to receive any signal provided certain restrictions on
its use were observed. This very sensible language preserved both the
rights of the private individual and the rights of the owner of the
information transmitted.

The law said basicly that one could receive any signal as long as the
information is not disclosed and is for personal use. (Simplified
interpretation.)

Under this language, I could receive:

The police
Land mobile transmissions,
Marine radio transmissions,
Sattelite transmissions,

any other electromagnetic radiation that penetrated my property.

I could not:
reveal it to another person,
Use it for personal gain,
Interefer with the transmission.

Unfortunately as of late, two concepts have florished in government circles. One is that "collective interests" are more important than individual rights and must be served at the expense of these rights. One only has to look at the things the government does "in the public interest" or "for Society's benefit" to see this point illustrated.

The other concept is that it is intrinsicly wrong to have fun. Especially if that fun is different from yours. Some people who disagree with the concept of scanner monitoring as "Voyeurism." As one who enjoys several somewhat socially unacceptable hobbies (shooting, motorcycling, ham radio, computers), I've seen my share of this effect. I used to attribute it to other causes such as snobism but I realized awhile back that the root cause is that many people just hate to see others have fun!

Then, of course, we have to take into consideration the propensity of the government to sell resources to the highest bidder.

We've so far allowed the HBO types and the Cellular industry get away with one public resource grab. The question is will we let it continue? I hope not. I hope the ECPA will get the proper constitutional challenge and that it succeeds. If not, a logical conclusion to this process could be that one day any "unauthorized" reception of electromagnetic radiation - including that which we call light - will be banned unless specifically designated as legal. Think about that one for a minute.

John

>
>Russ Poffenberger DOMAIN: poffen@sj.ate.slb.com

This got me thinking about the audio/ham-radio gear I have installed in my
car. Can anyone confirm if the following would work:

```
(-) 12 Vdc (+) 30 Amp
+--- battery ---o-fuse-o--+----> to your favorite & expensive equipment
| |
| -
| ^ 30 Amp +15 Vdc Zener diode ( just match the
| | diode rating with
+-------------------------+----> car chassis the fuse rating )
```

Are there any better ideas out there? What can be done to clamp a large
voltage surge or at least blow out the fuse when a surge occurs?

Thanks,
Cliff

As a SWL, former USAF Officer, Ham & USAF MARS operator, I support the right of anyone to listen to anything that is transmitted over the public airwaves, whether encrypted on not, provided they are not doing so for gain. This was the concept of the Communications Act prior to its corruption by the ECPA. The ECPA came into being only to allay fears of the celluar telephone lobby that fear of monitoring would cut into their profits.

Incidently, there is no such thing as a "secure" radio link. One of the principles of electronic security is that encryption merely DELAYS the time that the enemy will recieve information from your transmission, hopefully till after the information is already known to him by the bombs falling on his position! Any device made by man can be broken by man given enough time and money. Encryption in the military costs the enemy time; encryption in the civilian community costs the snooper money.

Finally, don't overlook the value of signal intelligence (SIGINT) even if the signals are encrypted. Just the presence, absense or change in volume or routings of encrypted messages is valuable information.

Neal,
I think you are going a bit far to call England a police state. The UK
government (Thatcher in particular) has, and always has had, the attitude that
it knows best when it comes to matters of what they regard as "security". Hence
there is no freedom of information act and they do tend to try to repress
politically awkward stories. (I'm sure the US government would like to do the
same if they could!). To say England has no right of free speech is rubbish. Go
to speaker's corner (Hyde park) in London any day and you will see for yourself.In addition
take a look at real English TV if you ever get the chance. It is far, far more
uncensored than american TV. As for guns, well, I would guess that more people
are shot in New York on an average DAY than in an average YEAR in England.
You can certainly own a hunting weapon (shotgun) in the UK, they just make sure
you are a responsible citizen first - what's the problem with that?
To top it all, they actually have a no code licence - free access to the
amateur bands with only a tech exam. There's liberty for you. I could say
much more, but it would be inappropriate for this newsgroup. This posting
probably is too, but I couldn't let your statement go unchallenged.

Sorry to spend the bandwidth on this, but to set the record straight on U.K. politics.

>England seems to have many laws that classify it as a police state:
>No right of free speech,
Nonsense. With the caveat below, relating to political ads, you can say what you like, when you like, and to whom you like.
>very restrictive gun laws,
True, thank goodness - and a murder rate a fraction of the U.S. as a result.
>an oppressive "Big Brother"-type government,
Where did you get this? If Thatcher were any more in agreement with Reagan she'd have divorced Denis & married him.. She even got him a knighthood! (given by the queen, but put forward by the P.M.)
>high taxes.....
Last time I was in a position to notice, the standard rate of tax in the U.K. was around 30%. I'm currently paying 28% Fed + 7% FICA + 6% State = 41%. There is a higher U.K. rate for top earners, there is also a 33% Federal rate in the U.S. .
>and now I find out this: you cannot even listen to radio waves
>passing through your own body!
Actually, I agree with you on this one, unfortunately it seems that the U.S. is going the same way.

Re Greenpeace:

This probably ran afoul of the paid political ad laws. Here in the U.S., the 'speech' of political ads is NOT 'free' - its bought & paid for. This means that the party with the most money gets the most T.V. time, and gets the attention of the masses, & presumably their votes. In England, TV political ads ARE free - i.e. the broadcasters have to give free time for political ads, and every party gets their share - even the loonies on left & right. A fairer system IMHO. It means you have to be fairly strict about what constitutes a political ad, or everyone else would cry foul...

I now return to the regularly scheduled discussion of shoplifting, pizza, BARF, gun laws, free speech, and, maybe, ham radio.....

Mike G4ASQ / KC1?? - soon I hope

4306. FCC monitoring law

With all the flames on this net about snoops vs. uncurious types I for one would like to know EXACTLY what the law says about monitoring various communications.
I'm familar with the now obselete law of 1934 that says in essence that you can receive anything that's out there, just don't pass along anything you may hear.
Now the law has changed and if I put any stock in the rumors, opinions and flames, I would conclude you can only listen to international broadcasters, public broadcasters and hams.
Does anyone happen to have a copy of the new FCC law so when can all see it?

David (and others out there who might be interested):

For mobile operation with my 2m/70cm rig, I purchased the Icom dual-band
antenna (the AH-32). I have been very pleased with its performance.
It is relatively small, screws into a SO-239 connector, and has
high quality materials and construction. The price was about $35 (I think).
For base station operation, I purchased the Austin Suburban Tribander
(144/220/440) from Austin Custom Antennas in NH. This latter antenna
was reviewed in the April 1989 issue of 73. Price, about $69.
Also excellent quality and performance. I recommend both. BTW, I think
Austin makes several multiband mobile antennas as well.
Hope this was of some help,

sxn%ingersoll@Sun.COM (Stephen X. Nahm) writes:
> Kind of odd text for code practice, eh? (Unless W6ADO is actually
> engaged in proselytizing.)

Not really, here's why:

I just learned code and passed the Tech test. (And oh, how slow the FCC seems to be moving!)

While on the way to the local library to look for a copy of QST to check my code copy against, I tried to think of more available sources for code practice material. This is what I came up with:

1) The Bible (version, book, chapter and verse needed)
-- many have no copyright, most others don't care
2) Any major newspaper (The Wall Street Journal and the New York Times come to mind) -- stock reports could be used for letter/number practice, copyrights are a real problem
3) A well known cook book (Better Homes & Gardens, Betty Crocker, Joy of Cooking) -- at least one can be found in most homes, but versions aren't standard.
4) Telephone books (only useful for a limited geographical area) -- copyright only applies to the format, the data is free
5) Any major catalog (Sears, Wards, etc.) -- probably too commercial in nature

Of these four (and I'd like to see additions to this list) only the Bible is widely distributed, standardized, and free of copyright hassles. My next choice for distribution and availability would be last week's Wall Street Journal. QST is probably a good choice for W1AW because it eliminates any copyright problems and it can be found in many libraries.

If the quoted material was in fact from the Bible (I didn't recognize it), then it would be quite useful as code practice. If not, then it isn't code practice at all since it is not verifiable!

> ' there's no place to put a whip on a RS discone'

My RS discone came with a plastic cap on top which covered a 3/8" (or so)
bolt which protruded from the top. I took a 1/4 wave UHF whip and screwed
it right on there..

As to the elements, yes they are light duty. If you can get it in the air
without damaging it you're ok.. I know somone who broke a few on the way up
, his name is CHRIS :-). I think he got some parts from RAdio Shack and tried
again.. If you're impulsive but careful, go to RAd Shack. If you are
prudent and patient, possibly a chronic antenna bender, go else where.
ICOM sells one too I think.. As I recall, it has a 6 Meter whip on top
and costs maybe 30% more than the RS..

You don't have a right to privacy if you explicitly give up that right. If you
and your spouse choose to make love in a public place, then do you have a
reasonable expectation of privacy? Of course not. You could not claim any
such right in that case.

Your right to privacy exists when you have taken reasonable precautions to
ensure it. You go inside your home, pull down the shades, and do whatever
you wish.

> (By the way, whatever happened to amateur radio on this newsgroup??)

The feeling that most of us have is that if you transmit messages IN THE CLEAR
on a radio frequency which is technically easy to receive, then you have NOT
taken reasonable precautions to ensure privacy. Cellular phone transmissions
are IN THE CLEAR, so and are FM just like your 2 meter HT is. You can even
receive cellular transmission on an 82 channel TV set.

> articles/etc will be greatly appreciated.

Larsen makes a dual band mobile antenna for several of the mounts they
support. I just ordered the model NMO-2/70 ("motorola compatible mount")
and an NMO-MM magmount base. I can let you know how well it works.

Alternatives are to use a duplexer and separate VHF and UHF antennae.
This gives you some better broadbandedness on UHF, as 3/4 wave and collinears
narrow the bandwidth. If you plan to use 430 Mhz as well, you might need
the 1/4 wave to get reasonable SWR on all 20 Mhz at once.

I AM GATHERING INFORMATION ON THE FEASIBILITY OF ESTABLISHING A VAN FOR DISASTER AND PUBLIC SERVICE SITUATIONS.

THIS WOULD BE CO-ORDINATED BY LOCAL HAM RADIO CLUBS AND WILL HOPEFULLY GAIN THE SUPPORT OF LOCAL GOVERNMENT. WE WOULD EXPECT TO INSTALL UHF, VHF, HF, PACKET, AIRCRAFT, MARINE, AND SEVERAL OF THE PUBLIC SERVICE RADIOS. THE THOUGHT OF A PORTABLE REPEATER HAS ALSO CROSSED OUR MINDS.

WE WOULD APPRECIATE ANY INFORMATION FROM ANY PERSON OR GROUP THAT HAS GONE THROUGH THIS PROCESS.

THANKS FOR YOUR HELP.

A couple of years, anyway. Don't knock it. It's on almost continuously, and there is a certain... incentive shall we say... to get your code speed up so you don't have to listen to it any more. I got my speed up to Extra level by listening to this station. I read the frequency as 7.099.

Yep, the Larsen dual band mobile antenna is a decent choice if you want to purchase such a thing. I have the Yaesu FT470 dual band and I use the Larsen with a mag mount on the auto and it works like a charm...cost around $70.00 though. I believe it is 1/2 wave on 2 meters and 5/8 for 70 cm. If you live in a marginal reception area, a 5/8 wave antenna for 2 meters does outperform the dual bander there (in such a case you can purchase a duplexer and install separate antennas - probably the 'best' but least flexible choice.) Then again, with a duplexer and a J-pole for each band is a reasonable solution for the roof - and the J-poles are so easy to build yourself.

From: jmseb@cbnewsd.ATT.COM
Message-ID: <3350@cbnewsd.ATT.COM>
Source record: 15234

In reading these various postings on military communications, restrictions in the UK, etc., I am reminded of several books I have read that give various peeks at the world of SIGINT (signals intelligence). Two popular ones are THE PUZZLE PALACE (about the NSA) and SPY CATCHER (about British counterintelligence by one of its one-time officers). One interesting part of the latter was the story of how the British made use of the fact that the local oscillators of radio receivers are actually little transmitters. They developed a fairly elaborate scheme for detecting what the in-country spies (usually Russians) were listening to by monitoring local oscillator signals. They used mobile vans, overflying airplanes, etc. It was apparently a great secret at the time. Both books make the point of the tremendous value of SIGINT and the cloak of secrecy that is required to protect methods and technology. Perhaps this is part of the reason for the sensitivity of the British to even unauthorized reception of radio, albeit a historical reason that may not be relevant today. Also, multiply Bob Parnass's postings on scanner frequencies by several orders of magnitude, and you get a feel for one aspect of SIGINT. Again, as I read these various postings and flames (unfortunately), I would hope that hams understand a little bit of history.

4322. emissions...

Newsgroup: rec.ham-radio
Date: 1989-11-28 07:24:34 UTC
From: dsmythe@cup.portal.com
Message-ID: <24532@cup.portal.com>
Source record: 15239

Hmmm. Can I really listen to any EM that goes through my house? (I'm
sure the answer is yes, but I needed a lead-in... read on)
I remeber a while back hearing of the ability of reading what is on a
computer display via the stray EM emissions from the connectors, etc.
Anyone who has tried to watch low-channel VHF TV near many home computers
knows how efficient the computers are as transmitters :-). Living in an
apartment in CA (where the walls are paper thin) it might be no trouble at
all toread" the screen of my neighbor's terminal/word-processor/etc.
Is this legal? (probably) Is it ethical (probably not -- it wasn't
intended to be transmitted and security in this type of case would be
most likely more than a trivial inconvenience.)
How about sound? Sure, shouting in a public place leads to an obvious
conclusion. How about using a parabolic microphone to listen to my neighbor
who happens to leave his window open? Is this eavesdropping? Why? If so,
Why isn't listening to a cordless telephone?

I bring this up because I think that the questions are interesting,
not because I am trying to push a point of view.

Another thought: what about more sophisticated listening devices than a
simple parabolic antenna? What about a laser on their window? Also,
suppose that I hear (via radio) an encrypted message -- is it legal
(assume for the purpose of discussion that I have no access to classified
information and simply use my own ingenuity) for me to decrypt and listen-in?
How does this compare to decrypting microwave-broadcasted pay-TV?

(do these questions belong elsewhere? If so, sorry...)

Since you put yourself out like that, I'd sure like to suggest you follow up on it. You need to get some REALLY qualified engineering opinions (call them "second opinions" to the lawyer type). There are some people here on the net would might be able to help.

As close as you are, I would not be surprised that you can get the cellular transmissions on many other frequencies as well.

Based on the way the lawyer talked, it is clear and obvious to me that the only reason they wanted the ECPA in the first place is for hassling people like you, so hassle'm back.

Tell them if they don't send engineers out, and actually coordinate with you on checking the equipment, that you will be filing a formal written complaint with the FCC for "transmitting on unauthorized frequencies and causing intentional (for failing to try to correct after a reasonable period of time) interference to other radio services".

And last but not least, post everything on here, including names of people, companies, phone numbers, addresses, etc. Some of us might like to know what companies are screwing up.

By the way, I had plan placing an advertisement in the local newspaper that tells people something like:

Are you aware that due to FCC frequency changes, cellular (mobile) radio transmissions can be received on an ordinary TV receiver on

channels 70-83 and that your children may be hearing things on "TV" that you would not want them to hear, like personal and private telephone conversations between individuals? Receiving any of these unscrambled signals is also a VIOLATION OF FEDERAL LAW.

What can you do about this? First, NEVER allow your children to freely tune the UHF dial on your TV without you being present. NEVER tune above channel 69 for ANY REASON. And also contact your congressman and demand that they make a law that requires the FCC to either make the cellular phone scramble their signals or move to another frequency. Newer TV sets do not have channels above 69, so if you have an older TV with 70-83, destroy it as soon as possible and replace it with a new model.

Scary, isn't it. Well, I'm holding off on the idea, because it just might create TOO MANY waves :-). I know the cellular industry would not like it one bit.

If you can find some, Ethernet coax has an excellent shield. 2 braids and 2 foil shields. Other than that, it looks like RG8 with a solid center conductor. And a bright yellow or orange color on the outside.

Transverters can get you an just about *any* band, and for a lot
less money than buying a rig that band!!

A note: The ICOM (I think the 740 also has the same output)
transverter output (which is REAL handy to have) has an output of 30mv into
50 ohms... (if my math is correct) this is about 18 uw (yes micro-watts)..
The commercial transverters that I have seen need a drive of about 1 mw to
500 mw (milli-watts)... So, some power gain will be needed, and the
transverter will probably not direct connect to the ICOM radio.
By the way, I use an ICOM-735, and have checked the manual for several
of the newer rigs... they *seem* to have the same transverter levels.

There are several ways that this can be done, a simple gain circuit
would only need to operate at 28 to 30 MHz (considering a 10 meter to whatever
transverter).

Has anyone done this? Do you have a simple and proven circuit to
share with the rest of us?

Another way, would be to attenuate the ouput of the rig, and bring
the 100 Watts down to the 500 mw (milli-watt) level (about 26 Db of
attenuation). Some have told me to just lower the output of the rig down
to the 10 watt level with the front panel control, and then attenuate that
down to the proper level, but I think this would be UNSAFE! What would happen
the first time I forget to lower the drive control on the rig, and dumped
100 watts into a circuit that was expecting only 10????

So.... any working solutions out there in net land????

Thanks, Rich (NM1D).

>On occasion I hear "CQ Contest" on the air. I do not participate in contests
>myself and wonder whether I should answer the call and give the caller a
>contact or whether I would be a hinderance since I don't know all the numbers
>and things that the contesters use and would thus slow him or here down.

>Any advice from contesters?

> Jim, NX9F

Definitely call! But, as a minimum, first listen to the guy calling CQ work a
few people and figure out the exchange you should send. If you have enough
time, look in QST or CQ magazine to see if it is a DX or domestic contest
and what the exchange is. But in most contests (the CQ WW CW/SSB contests
the last weekends in October and November and the ARRL DX contest in Feb/March
being the only real exceptions) a contact from the US counts as points for
a US contester.

What to send? If you hear WB2EKK calling CQ TEST, return with your call sent
ONCE. When he sends back NX9F 599 08 (IARU HF contest) you send back the
exchange ONCE (599 07 or whatever) and that is it. You don't have to send
your call again (unless WB2EKK asks for it and he always gets the call right
the first time) and you need only send the exchange once. On CW send at
the highest speed you are comfortable with. A good contester will slow down
to match your rate.

See you in the 10 meter contest weekend after next. 73 John WB2EKK @N4QQ

No - they were not told that they couldn't say that they were concerned about
the environment, or use those words. What they were told was that they were
not allowed to advertise Greenpeace.

In Britain, at that time, *no* charities were allowed to advertise on TV. The
idea was that since smaller charities cannot afford such advertising, it was
better not to allow any to advertise. Now that rule is about to change, and
such an advert will probably be okay. However, political organisations are not
allowed to advertise on television or radio, in order that we do not end up
in the US situation where the party with most cash to spend on nauseating
adverts wins the election.

>

I don't know what Matt thinks, but I reckon that we don't have things
too bad. There are problems, of course. A major one is the ban on
reporting of speeches made by terrorists and their apologists WRT
Northern Ireland. I abhor these lunatics and their evil ways, but
to ban them from showing themselves up in public is, IMHO, a very bad

piece of legislation. We have pretty autocratic government, but that may
be changing fairly soon.

4329. My R4 experience

Newsgroup: rec.ham-radio
Date: 1989-11-28 16:50:03 UTC
From: harrism@aquila.DG.COM
Message-ID: <727@xyzzy.UUCP>
Source record: 15250

I'd like to throw in my two cents worth in concerning my recent encounter with an R4. I'm sure it applies equally well to an R5.

First, I just purchased an R4 from Ross Distributers in Idaho for $189! That is $40 less than the old price for the R4 & $80 less than that for an R5. With that difference I can have an R5 (conversion kit is $45) for the same as an R4 was normally. I'm not sure how many more Ross has.

Second, I installed mine on a chimney mount with a 5 foot mast. This put it at 23 ft. Most importantly, however, it was only 5 feet above my metal roof vent strip & the ground radials were only just above the Chimney cap.

The SWR curves for 20 & 15 (don't have the other bands) was horrible with 15 being the worst (1.9 being the BEST swr). As an experiment, I replaced the 5 ft mast with a 10 foot one. The results were incredible! SWR on 20 & 15 especially came dowm to match their curves. I measured the roof vent & it was close to 1/2 wave long on 15. This was most likely the problem.

I had to put the 5 footer back in as the 10 was too spindly, rusty, and my chimney mounts were only 18" apart. Too much of a moment for proper support.

I'm going to put it on a 30 ft push up mast as soon as I can.

Otherwise, I love the antenna - The performance is very good & the SWR curves are excellent. Just remember that it is VERY sensitive to nearby metal object - esp if they are resonant lengths. I don't think that the documentation stresses this enough.

Enjoy!

>Subject: Heath SB102A - $ = ?

>I have just recently passed my Novice exams (and anxiously awaiting my ticket)

Congratulations and welcome to the world of HAM radio. You'll find the nicest people on the radio. Especially us "old farts".

>and working on the Tech. I have a friend who is selling his Heathkit SB102A
>radio. I have some questions about it.

>First: Heathkit SB102A (this guy built it himself)
>with Power Supply Speaker, clock, etc. (3 modules to make a console)
>Noise Blanker SWR 10 - 80 meter coverage.

>Now on to the questions:

>1) What is this worth?

Not much, however if it works, NEVER argue with success!

>2) Is it worth buying?

If it's the "right" price! (I GAVE away my SB102A to a new ham a while back!)
{Not too relavant, I seem to always find a needy HAM when I want a new rig!}
{And after 33 years of ham radio my XYL still lets me get away with it!!!}
{Must be love.}

>3) Any problems with these units that you can relate?

Lots! The finals (Transistors) were always blowing out when the rig had a minor (very temporary) interface with a less than PERFECT antenna!

There are MANY "birdies" in the receiver.

VFO is unstable (as designed).

>4) Anything I forgot?

On the positive side, I worked lots of stations world wide, used it on field day, and even in my truck.

It went back to Grief-Quit after I was un-sucessfull in making it all work. (After I built it!) It turned out they had mis-marked parts... get this... diodes with the band on the WRONG side! Poly-Packs parts I guess...

(Heath wrote to me and said that as a technician for MIT, I was too underpowered to be able to assemble a kit that complex... but they found NO assembly errors)

The station console is a beauty, watch out for bad displays, punched thru phone patch capacitors, 7490's that are tired. And NO battery backup on the clock!!! (However, I still use mine!)

The power supply/speaker is O.K. (Hard to mess that up too bad.)

I'd say, taking into account my bias, it's worth $200.00, the WHOLE thing!

>I'd appreciate mail; I'll post the answers if there is interest!

>Thanks for the replies.....,
>--

Your (gulp) welcome, Free advice is worth as much!

>Are there any better ideas out there? What can be done to clamp a large
>voltage surge or at least blow out the fuse when a surge occurs?

The usual thing to do, rather than use a humpin' big Zener diode, is
to use a crowbar circuit built around a small Zener diode and a big
SCR. I'm not going to try to do the schematic with ASCII graphics.
The idea is that you connect the cathode of the Zener to the positive power
supply, and the anode to a resistor to ground. The anode will remain
at ground potential until the supply voltage exceeds the breakwn
voltage of the Zener.

From the anode of the Zener you also connect a capacitor to ground, to
bypass noise, and you connect the anode of the Zener to the gate of
the SCR. The anode of the SCR goes to the positive supply, and the
cathode goes to ground.

Under normal operation, the Zener doesn't conduct, the gate of the SCR
is at ground potential, the SCR is off, and the crowbar circuit is
dead. When the voltage exceeds the Zener breakdown voltage, the Zener
starts to conduct, and its anode rises above ground potential. When
the voltage at the anode of the Zener reaches the trigger voltage of
the SCR -- foof! -- the SCR turns on, and stays on until the fuse is
blown.

It helps if you can put some resistance and/or inductance between the
crowbar and the load.

As a poor ex-patriot englishman, trying to make sense of a foreign culture, please excuse my lack of detailed knowledge. I hear "the right to privacy" cited as a "right to chose (abortion)" arguement. I believe it is derived from the protection against unlawful search and seizure but I'm not sure exactly how. By the way, this discussion is getting too far away from ham radio to be in this news group. Please address replies via e-mail to me at att!mhgki!rma, or whatever header appears on this posting.

>base is classified information. That is why I asked why he was interested in
^^^^^^^^^^^^^^^^^^^^^^^

Classified information ?? ARE YOU SURE ?? Could this come under the heading of "GEE, I THINK it should be classified". An awful lot of things that people THINK are classified are not. Let me give you an example of why I believe you are wrong.
Anyone with who lives on the seacoast of New Hampshire can easily listen to Pease AFB tower and approach on the commercial aircraft band. In fact while flying in the area I actually had a nice conversation with the tower. Anyway, during busy times, the tower will "simulcast" his "UNIFORM" (UHF) radio and his commercial aircraft radios to keep everyone aware of each other. After a while you become aware that there are certain callsigns that keep appearing and re-appearing. Hmmm RAZOR xx and PAC xx. (xx is a number). HMMM, could this be their HOME BASE ?? After all from reading the newspapers in the area you know there is a squadron of FB-111's and KC-135's. So what's next ?? Well you realize that there is an OPEN HOUSE and AIR SHOW comming up. So you go to the show and find one of the FB-111s on display. Standing right next to it is 1 each, driver, FB-111, official. You walk over to him and start a conversation with him. He is friendly and answers your questions. You learn that this is his home base. You ask if they use the "RAZOR" callsign. He says yes and this is RAZOR 5-1. Lets stop and look at this picture. If the callsign and his home base WERE classified, do you think that he would have given you this information ? I really doubt it. Is this an isolated incident ? No. I have asked for the callsigns of attack hellicopters and other aircraft and have been given this info.
In the new england area we have various agencies using various callsigns. MOOSE are the B-52's from LORRING, and PAC are the KC-135 from the NH ANG. Therefor, please don't assume that things that you think should be classified are.
In my original posting I was only looking for similar info. NOTHING CLASSIFIED.

> and I'd like to toss in my 2-cents' worth. If any "in-the-clear" radio trans

>Any advice from contesters?
> Jim, NX9F

I suggest you work the guy, and give him the point. If he is sitting there running a string of other contacts, then maybe not, but if he is calling CQ with no response, his time won't be wasted by your contact. He should be able to explain to you quickly the information you need to tell him.

Disclaimer: I only participate in VHF/UHF/SHF/EHF contests. (I haven't participated in any for the last year; I'm now a full time student again.) This advice should be good for contests on the "DC bands" also.

In the very short term the Mac is more friendly (but not perfect) but you have to consider how much money there will be in selling Mac Killers, that is, PCs which have the graphical interface but cost much less. Excel on the PC is quite nice and I have seen Word for Windows already. Lots of people are coming up with icon type enhancements for Windows and of course there's always OS/2. There's all kinds of neat and cheap software for PCs like the geography program called PCGLOBE, $40.

If you want to run engineering applications, the PC has much much more software available.

Well, Mac lovers, flame away!

Commercially made crowbars are also available. I've seen them show up occasionally at hamfests. They're usually made by Lambda, a major power supply manufacturer. They consist of a long, thin grey rectangular metal box with two pigtail leads and captive screws for mounting on the side of a power supply chassis. Cost is usually $5 or so.

One advantage of these commercial crowbars is that the trip voltage is usually adjustable with a trimpot.

My personal opinion is that anything other than the rules set forth in the
Communications Act of 1934 would be unenforcible and probably unconstitutional.

If some entity using the publicly owned radio spectrum does not want me to
receive their signal in my home then they'll just have to keep the signal
out of my house.

note: Police States work under different rules, so they above would not apply
in some other countries. ;-)

4342. Protecting Mobile Rigs

Newsgroup: rec.ham-radio
Date: 1989-11-28 20:38:16 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <184150@Wayne-MTS>
Source record: 15270

There are two dangers- overcurrent, best protected by the rig itself, and overvoltage- which most rigs are designed to handle. Sort of.

Most commercial specs call for protection against a certain amount of alternator dumping, but are not prpared for the worst case. This can happen when you've got a low battery, high charging rate and the regulator opens, for one reason or another. According to a friend in the business of supplying electronics for military vehicles, the voltage can rise to many times the regulated voltage.

So what should the careful ham do? First, put in your own voltage regulator or crowbar to protect against dumping, and perhaps a current limiting system as well. Both of these can be accomplished very simply with a fuse or circuit breaker and a stout zener. If either overvoltage or excessive current occurs, the fuse/breaker pops.

You said you are considering using the 727 in your mobile. Those things (along with the 209 and 709) have terrible audio, and unless you have a very quiet automobile, you aren't going to be able to hear what people are saying. I have a 709 myself, and while it is barely adequate in quiet surroundings, it leaves much to be desired in noisy surroundings. On the other hand, if you put an external speaker on it, it will be fine. Seems that little wimpy speaker they put in those things just don't cut it. I have a friend who traded his 709 for a 708 (the preceeding model) because the 708 had much better audio. Also, the battery on the 708 lasts all day in rx mode, where the 709 only lasts about 5 or 6 hours. I have a friend who has a 727, and the battery in that thing only lasts about 3-4 hours in continuous receive. When are these designers going to get rid of all this fancy computer-controlled radio stuff that draws too much current in rx mode, shortening the charge time on the radio? I can't tell you how nice it is to have a radio that I can just leave on all day, all on one battery. I realize they have "Battery save circuits", but they don't do that much, and they end up chopping off the first few words of someone when they "freshly" key up.

Considering the thread of discussion, yes, it belongs here. But if this discussion wasn't going on, it wouldn't belong here.
Anyway, all of those things you said (the eavesdropping, laser on the window, perhaps bugs, etc.) ARE illegal for all but police with a court order *B*U*T* ordinary (?) people (especially the corporate world) do it all the time to try to get an edge on what their competitor is doing. And don't forget Russia breaks that law everytime the KGB does some spying on our soil.
So is it ethical? By your ethics, no (I HAVE no ethics except my own!). Is it legal? Mostly no. Is anyone going to catch you? NO! (Unless you publicize it throughout the US loud enough for someone to hear). The only people who will really pay any attention to that kind of thing are the FCC (and we already know how fast they would catch you on something like that - a century maybe?) and the FBI (who probably won't really go after you unless you're a MAJOR crook they're looking for or you're into drugs or the like - something BIG and NASTY) or CIA (who probably won't care so long as you don't get a hold of anything important).
Since I'm here, this is an interesting subject: those wireless microphones that run on FM (usually FM broadcast) sold by, among others, Radio Shack. They clip onto your shirt and the antenna is small enough to run down the inside of your shirt. Since they are only about 1"X1/2"X1/2" (those are rough estimates) I figure they could easily be used as a bug. Plant it someplace someone will probably never find it (like those couch cushions with the foam that have a zipper to put it in; cut out a small piece of foam and put the mic in the middle, then replace the foam. No one will ever suspect until years later when they go to replace the foam, but the battery will have long since been dead!).
It is unethical and illegal (I think) to do this, but we all do it (I did it to my sister many times when I was little, just with different things).
But radio in general should NEVER be considered a secure communications medium because no matter how illegal something is, if someone wants to break the law, they will do it (ring a bell BARF and the druggies?). And I will NOT listen to any law restricting what I can LISTEN to because people should know that no matter how many laws they make against it, somewhere, somehow, someone will be listening, and if they hear something bad, the public will hear about it (probably through the already incredibly unethical American Press (may it never die)). Oh well, enough of me, lets hear what you all have to say now!

Message-ID: <12545983759010@osu-20.ircc.ohio-state.edu>
Source record: 15262

Since the rewrite of Part 15 rules, I believe it is no longer required to obtain FCC type acceptance to market low power RF gizmos. I take this to mean that I can now legally experiment with RF intercom's, remote control devices, and other stuff I might dream up - as long as I stay within certian frequency and power limits.

Does anyone know where I might find a copy of Part 15 rules - I only saw a brief summary in a magazine (don't remember which), or better yet, maybe someone could summarize the frequency,power,modes, etc these unlicensed devices are allowed to use.

Thanks,
Steve N8KWV

4349. The Right To Privacy

Newsgroup: rec.ham-radio
Date: 1989-11-29 04:34:50 UTC
From: ST7501@SIUCVMB.BITNET
Message-ID: <8911290808.AA12535@ucbvax.Berkeley.EDU>
Source record: 15273

As this seems to be a hot topic, I thought I'd put my 2c in.
The right to privacy is defined by criminal law, it applies to people, not spaces (as in property). What this means is that people have a right to privacy anywhere there is a REASONABLE EXPECTATION of privacy.
A few examples:
A man conducts a drug deal on a public telephone that is in an enclosed booth. In an attempt to gather evidence, government agents tap the phone without a court order. They are legal in doing so because it is a public phone, right? WRONG!!!!! The U.S. Supreme Court decided (case info supplied upon request) that a person has a reasonable expectation of privacy in an enclosed phone booth. Now if that booth was one of the newer ones where it isn't totally enclosed, one would expect a lesser expectation of privacy.

This also applies to airwaves, whether specifically or intuitively. A person has a lesser expectation of privacy when talking on a cellular-type phone than he does on a landline.{ This is how the U.S. Supreme Court interprets the U.S. Constitution on privacy. And since there hasn't been a case before the Supreme Court that deals with the receiving of cell-tel transmissions, (at least, none that I am familiar with), we can only assume that the law will be interpreted the same way. Which might make the law that makes it illegal to listen to cell-tel unconstitutional. Wouldn't that be something!!

I guess you forgot that I didn't get testy until the issue got beyond the radio signals and became inquiring into bases and missions.

Only if it involves snooping into other's private lives/business. I guess my hangup is the mentality of the people engaged in the practice. I can't fathom why any moral, intelligent person would WANT to snoop like that.

No, it did not develop to the present blatancy until fairly recently. Before that, people voluntrily minded their own business simply because it was the polite thing to do.

But enough of this. Neither of us is going to change his mind, so why beat the issue to death?

It is NOT legal, Tad. Darin Arrick asked if it is legal. I replied by quoting
Part 97, to wit:

S 97.113 Prohibited transmissions.
(a) No amateur station shall transmit any communication the
purpose of which is to facilitate the business or commercial
affairs of any party. No station shall transmit communications as

In response you became so confused you started to try to convince everyone that
the FCC no longer issues amateur station licenses.

Sheesh!

Of course that didn't stop Congress from passing just such a law. The Electronic Communications Privacy Act makes every owner of a TV with an older UHF tuner a potential felon. The uppermost few channels (80 - 83) were reallocated for cellular phone use, and listening in is now a crime.

Congress basically knuckled under to the cable TV interests when it made it illegal to receive (even if only for personal use) certain transmissions "not intended" for reception (like HBO, etc.). Instead of dealing with the physics of the situation and telling HBO to develop a better scrambler, they made a recourse to lawyers available.

Of course this won't provide any real security for cellular phone users, nor will it prevent anyone with even a modest knowledge of microwave receiver technology from tapping into HBO, but it will provide furthur employment for additional attorneys (which is just what this country needs to become more competitive in the international electronics marketplace :-)

4357. Over-voltage protection for mobiles.

```
Over-voltage Crowbar circuit
----------------------------

The following circuit is better than the suggested idea of a high power
Zener (where would you get one, and how much would it cost?)
Mine uses a low power zener and a slave thyristor/SCR, which
are easier to come by (and cheaper if you actually have to pay hard cash!)
Befriend anyone in AC power engineering if you want a supply of SCRs.

+------!30-amp-fuse!---------------------------------------->to radio
12V ! !
supply. ! __+__
! /~\ 20-volt zener
! /---\ 1 watt rating.
! !
__+__ !
SCR /~\------------!
100 volt / \ /
100amp /-----\ \100 ohms
! / 5 watt resistor
! !
-earth------------------------------------------------------>to radio

This will protect you if the voltage goes above 20 or so. It has the
merit that the SCR will 'latch' and always blow the fuse. If the supply
has spikes on it (alternator commutation whine, or induced voltages from
electronic ignition) then it may trigger falsely. A 10nF capacitor in parallel
with the 100 ohm resistor acts as excellent electronic Valium,
alternatively, stock up with 30-amp fuses.
Similarly, if the radio is one with defective RF filtering on the supply
leads, and RF gets into it, then the crowbar circuit will false trigger.
You can hang this circuit on the output of your 12-volt shack power source
too - it will save your rig should one of the series-pass regulator transistors
in the power unit decide that its going to go short-circuit.
It is cheaper to protect your rig than have to replace all the
semiconductors!

>and overvoltage- which most rigs are designed to handle....

If you use a crowbar, put a bypass capacitor at the SCR gate to provide protection against tripping by fast transients and RF. I recommend double bypassing, i.e., large and small capacitors in parallel. (Large capacitors may look inductive at RF.) It wouldn't hurt to make the zener diode's resistor out of a series of resistors with capacitors to ground in between.

BTW, the linear regulator in my Icom power supply failed and put 30 volts on my IC-720. It quit working and the lights got very bright, but when I cleared the problem (a stray solder blob), the rig was undamaged.

From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <184351@Wayne-MTS>
Source record: 15211

The local Heathkit store, who were busy cleaning out non-computer and discontinued stock a few months back, still had one (*1*) remote antenna tuner in stock when I called- for only $35! Not bad, off an original retail price of $120+. I couldn't resist; I bought it. I had a few vague ideas about using it in a small loop antenna for perhaps 160, or some such, but I mainly bought it 'cause it was cheap.

SO: Any contented or creative users of this beast out there who'd like to share your experiences, suggestions and wild ideas? For those unfaliliar with this, it's simply a large air variable cap with a remote mechanism.

When I was in the Air Force as a crypto tech, we were told not to divulge anything, with the assumption that everything was being monitored. True, small pieces of information could be unclassified, but put together, they could divulge some information that could be considered harmful to the nations ability to maintain a strategic advantage.

There have been times that I've had to hang up the phone to keep someone from blabbing more than they already have.

Here, Here!

And then there are the attorneys (we'll never know how many they number, they aren't the ones "in the headlines" or hired by the "large firms" to do the "important" work...) who see this ECPA for the nonsense that it is, don't have the independent wealth to go out and challenge it, and don't have the clients with the independent wealth to go out and challenge it, and besides, are just struggling to pay for the FT 470 they just purchased on their VISA card.

Perchance, if anyone gets into a jam with this law, please post the info so that such attorneys (and other interested parties) can come together in some sort of networking group to (hopefully) set this thing straight eventually.....the same should be said for the NJ scanner law - if anyone knows of a case or an attorney involved, maybe we all ought to know so that we can have some input if it is needed.

I've been using a homebrew discone for about a month now and love it.

The antenna is made out of 1/2 inch 'hardware cloth'. This makes it very hard to see and has little wind load. Total cost of the antenna is something less than $10. I put it together and had it mounted in an afternoon.

The lower design frequency was 140Mhz. The impedence was for the most part flat between 144 and 1Ghz, with several cusps near the lower limit. If you intend to use this antenna beyond 1GHz, feedthrough leakage comes into play so you might want to use finer material.

It sure beats the $60-$80 price tag.

Internet: Jim.Grubs@f1.n234.z1.fidonet.org
Jim Grubs writes:

*I guess you forgot that I didn't get testy until the issue got beyond the
*radio signals and became inquiring into bases and missions.

Which is something I still don't understand. Why did you get "testy"
because someone ASKED about the base and mission of a military callsign?
A question was asked, if it was inappropriate (in your mind or anyone
else's) then they or you did not have to answer. Did you bother to
query any military authorities on the legitimacy of such questions or
did you just decide on your own that this was not a good thing to ask?
It seems to me that asking a question should never in itself be condemned,
and that the only stupid question is the one that is not asked.

*Only if it involves snooping into other's private lives/business. I guess
*my hang-up is the mentality of the people engaged in the practice. I can't
*fathom why any moral, intelligent person would WANT to snoop like that.

Why do people climb mountains, jump out of airplanes and race cars? These
are not "immoral pursuits" but some question the intelligence of people
that do these things. To most people that use scanners, the thrill is
just in being able to HEAR things. Not the content per se, but the fact
that it "can be done". This is similar in a lot of ways to just normal
everyday ham radio. Some hams really don't enjoy ragchewing with people,
but instead enjoy the technical challenge of building and modifying the
station. To those that do listen to the police and other public service
agencies, they do so to keep informed of what is going on in their
community. U.S. law does not prohibit this, maybe you feel that it should,
but the idea here is that the minority has to go along with the majority.
If enough people echo your sentiments, then there may someday be a law
passed to that effect (however unenforcable it would be), but until then
it is not fair of anyone to CONDEMN and BLAST someone who is not breaking
the law. As to listening to phone calls, (or anything else) you have to
understand and accept that when it is sent via an omnidirectional RF system
it can be easily intercepted and overheard. The morality of those that do
this is really not germane. If you concern yourself with other peoples
morality, then you can look into their sex practices, their religion, and
a whole lot of other subjects that will ALWAYS lead to name calling and
hot tempers. I would like to see a degree of privacy inherent in cellular
telephones, but I have accepted as fact that this will never be the case
until they scramble. Discussions of the law, and people's morality will not
prevent SOMEBODY from listening. Everyone on the net agrees that they should
scramble because they LIKE the idea of a private conversation, but these

same people ACCEPT that the current law will do LITTLE to prevent people from "tuning in". They would like private conversations but accept that if changing peoples morality is the vehicle chosen to attempt this, it is doomed to failure.

*No, it did not develop to the present blatancy until fairly recently. *Before that, people voluntarily minded their own business simply because *it was the polite thing to do.

In the early days of police radios, they used a range of frequencies directly above the commercial A.M. broadcast band. It was a very popular mod to "convert" a standard broadcast receiver into a "police monitor". Mods to do this were passed from hand to hand especially among amateur operators. The same thing was true for the frequencies that the cops were using. How do I know this? I talked to a rather old ham about this subject (callsign on request but not "posted") and he SHOWED ME SOME LISTS! As far as listening to and discussing other peoples business... well, are you saying that "people" didn't start doing this until recently? Have you ever heard the expression "this is a small town and everyone knows everything about everyone" or words to this effect? People have ALWAYS minded other peoples business however impolite it was to do so! This is human nature.

So the bottom line is that you consider people that own and listen to scanners to be "impolite" (depending on what they listen to). The definition of "polite" is broad enough that you could be correct. However how you discuss a subject and how you feel about others and express those feelings in a world wide forum also fall into the category of being "polite" or "impolite".

Interesting thought?

*But enough of this. Neither of us is going to change his mind, so why *beat the issue to death?

This is a very good question. Do people post things with the intent of changing the minds of others? Somehow I doubt it. I think the idea is to exchange information and learn from the experiences of others. If nothing else, a lot of people saw a lot of different viewpoints expressed on this string and also gave a lot of thought on HOW to express their feelings in a logical manner without getting too emotional. Experience turned out to be a good teacher.

4369. Info on TI SN16913P

Newsgroup: rec.ham-radio
Date: 1989-11-29 19:39:45 UTC
From: wjc@athena.mit.edu
Message-ID: <1989Nov29.193945.25530@athena.mit.edu>
Source record: 15191

Does anyone in net-land have any information on an IC made by Texas Instruments called the SN16913P? There are two of them in one of my commercially-manufactured radios, but TI disavows any knowledge. Judging from the radio's schematic, the chip looks to be an RF mixer. I've seen the same chip in another radio made by a different manufacturer, therefore I don't think it's a custom part.

Thanks,

Bill

I doubt if you would have any difficulty with copyright licensing since verifiable code would encourage purchase of the printed material. Heck, you could probably get someone like the Wall Street Journal to pay for the station.

Source record: 15201

Actually my IC735 only puts out about -20 to -15 dBM before it distorts.
This is about the same level as my old IC751 had. However
the Microwave Module transverters will run with about 1 miiliwatt
drive in the low power configuration.
For the 50 MHz through 10 GHz transverter "stack" I use and
described in Ham Radio magazine last year I show a circuit for
20-30 MHz amplifiers to make up the necessary gain.
Actually, 0 dBm is a pretty good level for a transverter output
since almost any mixer used, other than a very high level one,
probably doesn't want to see a whole lot more signal than that to
keep the spurious performance in line.

"Instant Track", version 1.00, by Franklin Antonio N6NKF is now
available through the AMSAT office. I have it, and it's just
wonderful. Steve Roberts' review in 73 was right on the mark.

Perhaps the person who is happiest to see Instant Track is Bob McGwier,
N4HY, author of Quiktrak (AMSAT's standard tracking program until now).
Far from being miffed at having been outdone, Bob has expressed
considerable delight that from now on it'll be Franklin, not him, who
will get all the letters, email and phone calls at all hours of the day
and night asking questions about satellite tracking software! Being in
the volunteer-software-for-amateur-radio "business" myself, I know *exactly*
how he feels...

From: parnass@cbnewsc.ATT.COM
Message-ID: <5131@cbnewsc.ATT.COM>
Source record: 15199

Here's a timely piece from the Wall Street Journal:

Wednesday, November 29, 1989

NO PRIVACY -- "...Since the early 1980s, the courts have ruled in at least a half-dozen cases that private citizens talking on cordless phones don't have a reasonable expectation of privacy and therefore aren't covered by the Fourth Amendment. ... Both the courts and Congress have reasoned that radio technology used in cordless phones makes the calls easy to intercept, whether inadvertently or not. So, legal protections would be difficult to enforce. ... Lawyers say the courts haven't yet directly considered the rights of the person on the other end of a cordless telephone conversation ... but judges have indicated that if someone using a conventional phone knows the other party to the call is using a cordless phone, neither end of the discussion will be protected."

>
> Jim, NX9F

I would encourage non-contesters to give out a few points in a contest, especially late in the event when many stations are desperate for a little "action". Often you can listen around a bit and figure out if they are exchanging serial numbers or zones, and if calling another station in your country would be appropriate or not.

If you hear someone calling CQ Contest and getting no response, he would probably not mind spending 15 seconds explaining what information you need in an exchange.

>
> S 97.113 Prohibited transmissions.
> (a) No amateur station shall transmit any communication the
> purpose of which is to facilitate the business or commercial
> affairs of any party. No station shall transmit communications as

I believe it is ***LEGAL*** and here is why.....

The keyword is "communication". That is referring to the content of the communication. If use the radio to actually talk to the salesman and ask him the price, or otherwise discuss the potential transaction, then the actual communication, that is to say, the CONTENT of the transmission, is pertaining to the business at hand. That is not legal as I understand 97.113.

However, if the actual communication is nothing more than simple amateur communication, such as "This is KA9WGN testing" (something legal to do in any other setting) then I believe that the COMMUNICATION was legal because it had no bearing on the business at hand. I would be conducting an ordinary amateur transmission/communication while at the same time also observing the correct function of the equipment to determine if it suits my needs.

Others will argue that if I was not actually conducting the business, I would not have made that transmission, and therefore it did facilitate my business. My argument is that the loaning of the equipment to my portable station was the act of facilitating my business, and now that I have (for however brief a time) this equipment in my station, I want to determine if it operates in a suitable and legal manner. The facilitation of my business is incidental to the communication.

That's where I stand on the issue. Since I am not a lawyer (and am not trained or educated in law), you may consider my opinion worthless, and it certainly is not legal advice. It's what I would do, and you know how many things YOU do which you never consult a lawyer about anyway.

> double braid shields.
>
> Marc Kaufman (kaufman@Neon.stanford.edu)

Oh, now I guess we will start up into a "braid vs. foil" debate thread?

The radio theory I understand to be the case is that RF currents are
ordinarily found on the INSIDE of the shield, but with braid, because
there are some holes and because some conductors eventually make it
to the OUTSIDE, then SOME of the current flows on the outside.

Braided coax is typically rated at 80-90% shielding (because it is 20-10%
hole) and DOUBLE BRAIDED can be as good as 95-98% because there is yet
another braid layer (usually insulated from the first) that further isolates
the inner conductor. However foil shielded coax where there is NO HOLES
are typically rated with a shielding of 100% and the inner RF currents do
not reach the outside except where breaks or flaws (such as at poor connectors
like PL-259's) occur.

9913 is RG-8 size bonded foil shielded coax with a low density braid added
for DC/ground draining. 9311 is RG-58 size foil shielded coax.

If you need references, I'll have to go look them up.

Hello all,

Once more I am here posting for information regarding a CAP mod
for a Heathkit HWS-24HT dual band radio. Last time, the only
mail that I received, and lots of it, were questions asking about
the radio.

Well, needless to say we are still looking for the CAP modification
or the radio. I understand from the helpful people at Zenith
(how about it any of you guys reading this??) that it involves
inserting a diode and pressing a key sequence into the radio.
Does this sound correct? Anyone have any other ideas? Anyone
know the key sequence?

Lastly, I seem to be receiving mail instructing me to ask
Mr. Parnass; so here it goes. . . Mr. Parnass do you have any
ideas, thoughts, etc.?

Thank you all, and please keep responding directly to my email
address of: skoh@aludra.usc.edu

One thing I've found in Ham Radio is that some people like to be Lawyers for a day. They see not the spirit of a rule, but the printed rule. You could take any of these rules and mold them to your thinking. In this case I believe the spirit of the rule is to prohibit my operating a business using Amateur Radio frequencies. By stretching that to read the way your thinking is anti-american. The way I operate is to keep a positive Amateur spirit and reject any attempt to limit my communications unless directed to by the FCC. Self policeing is one thing, stupidity is another. This is a stupid interpretation, not within the spirit of the rule. As far as the other stuff with the continuing debate over the right to listen: I vote we confiscate all receiving devices, or let freedom rule. Piss on your moral problems...

There is also a wefax program for the Color Computer 1 and 2 (it might also run on the 3, I'm not sure) that requires NO external hardware to demodulate the signal! It uses the cassette port on the back of the computer. Connect the audio input to the radio (the Rat Shack's cassette cable is great for this, but you can make your own with connectors and a 5 pin DIN connector). I have a friend who has received many faxes with it, and it works GREAT! It requires a disk drive, however. I believe its public domain. If you want, I can get more info if you want.
Don't forget, too, that the PK-232 also has fax built into it. I have heard of a few problems with it, but nothing major.
Hope this helps. 73's!

4392. Scanner Law Guide

Newsgroup: rec.ham-radio
Date: 1989-11-30 06:56:39 UTC
From: rh@well.UUCP
Message-ID: <14773@well.UUCP>
Source record: 15218
Cross-posted to: rec.ham-radio,rec.radio.shortwave

There's been so much discussion of the legal issues of scanning this month that it may be time to remind everyone that the "ANARC Guide to US Monitoring Laws" is the only current and complete collection of state scanner laws in print. It also includes the key radio provisions of the ECPA, and short interpretations of each law by Frank Terranella, ANARC's counsel. The Guide is now in its third printing. Cost is $7.50 postpaid from the address in my signature.

These issues are so important, and there's so much gossip and uncertainty about what the law says. There's no reason to be uninformed.

In article <2942@cpoint.UUCP> die@cpoint.UUCP (David I. Emery) writes:

>It seemed very clear to one poster that it was improper to make use of
>services transmitted over the airwaves (such as pay tv) to which
>one does not subscribe.

My point was that it is illegal to receive the services without *paying*
for them. The point I was trying to make is that you have a right to
receive anything, but that a victimization occurs if you receive a service
that is intended as a revenue-generating product or service and you do not
pay the fair market value for the service.

Say that XYS Company is in the business of broadcasting a signal over a
satellite transponder that is intended for subscribers, and that the
subscribers pay a fee to get the service. Say that the XYS Company's
broadcast is a training program for police officers, and that XYS Company
targets the satellite broadcast to police departments around the country.
The departments pay for the service, and everyone is happy.

Now you come along and set up your satellite dish. You have the technical
ability to receive the signal. Now, here is the "trick": Even though XYS
Company does not target their broadcast at individual citizens, even though
they do not intend that the show be watched by ordinary citizens, if you wish
to receive their program, you have the right to do so. You have the right to
receive the signal, even if XYS Company does not want you to, and you have
this right because they are broadcasting the signal over the public's radio
spectrum. The only caveat is that to be legal, you must pay for the program,
just like the intended audience.

Think of it like a performance given in a public place: The group giving the
performance may have a specific target audience in mind, and they may have
advertised for a certain group of people to buy a ticket, but they cannot
legally exclude any member of the public who may wish to attend....but
everyone who attends, regardless of whether or not they are the intended
audience, must pay for the show.

Since the XYS Company is using the public airwaves for its transmission,
anyone who desires to receive must be allowed to receive the signal, but
they must pay just like the intended audience.

Now, say that the XYS Comapany uses two-way commercial radios for its
business communications. These signals go over the public airwaves, and the
signals themselves are not part of the programing they offer to any target
market as a revenue-generating service. In this case, any citizen has the
right to receive the signals, and they DO NOT have to pay for them, because
XYS Comapany does not expect anyone else or any other group to pay for them.

These two-way communications are NOT a service offered for sale to any group. However, they are boradcast over the public's radio spectrum, so anyone in the public has a right to receive the signals.

In this case I would make an analogy to people carrying on a conversation in public. If two people are discussing something in public, and I overhear it, that is just the way it goes. Their conversation was not intended for sale, so I don't pay for it. They may not want me to hear it, but this is the risk you run when you discuss something in public.

>I find it hard to understand why if I have an absolute "right"
>to interpret voltages induced across my backyard aluminum that that
>"right" ends just because somebody has defined their communication
>as something I must pay for.

I hope this posting clears up any misunderstanding that you obviously had as regards my position on this issue.

Your "right to receive" does NOT end just because someone intends that certain programming be paid for by the receiver. You still have the "right to receive".....the program provider cannot stop you from receiving the signal, but you should pay for the service, just like the intended audience.

You have an absolute right, IMHO, to receive ANYTHING that is broadcast over the public's radio spectrum, but this does not mean that you can get away with not paying for certain services!

>......then why is it not perfectly appropriate for Congress
>to define certain essentially private communications as restricted in the
>same sense as pay-for-reception transmissions are?

Again, IMHO, the only caveat in pay-for-reception is that you should pay for services that are intended as programming for revenue generation. The providers MAY NOT DENY YOUR RIGHT TO RECEIVE, but your right to receive does NOT guarantee that your can receive everything for FREE!

HOWEVER, you do have the right to receive anything that is broadcast over the public's airwaves. You cannot be denied the right to receive any signal that your can get into your antenna!

>Why, in short, should I have a right to listen to your phone calls but
>not watch HBO's video ?

You have the right to do BOTH....since I do not offer my cellular or cordless phone calls as a revenue-generating service, you do not have to pay for them. However, since HBO does offer their signal as a revenue generating service, you must pay for it if your receive it!

Subject: Radio (RF) Modems
To: "Robert M. Atkins" <att!cbnewsm!mhgki!rma@ucbvax.berkley.edu>

Bob,
I have been in touch with the company and received their whole package.
The reason they don't mention HAM Radio is because that isn't their target
market. They are aimed strictly at the business market. After all, if
you read the flyer, you will see that their answer to a TNC (not the PC
card) has an RS232 Synchronous Port. How many 3270 terminals do you have
sitting around your house??? :-) Interestingly enough, I worked on
designing a similar system with a friend who was also in the commercial
radio biz about 3 years ago and we were able to build a system the could
have sold for $1000 and did all the same things. Looks like a pretty
good markup on their product line.

4396. WANTED!! IC-04AT MODS Please!!

Newsgroup: rec.ham-radio
Date: 1989-11-30 14:38:07 UTC
From: marke@hpscdc.scd.hp.com
Message-ID: <5490077@hpscdc.scd.hp.com>
Source record: 14977

The subject of "mod's" for the IC-04AT have probably been brought up before here on the NET, but for some reason I have managed to miss them all. So, if some kind ol radio amateur could dig in to his or her files one more time, and post them for me, it would be muchly apprieciated. I am specifically looking for the mod's that pertain to out of band operation, and RX audio volume improvement.

Please post or e-mail, and thanks.

4397. This monitoring thing....

Newsgroup: rec.ham-radio
Date: 1989-11-30 14:42:45 UTC
From: MEHARP01@ULKYVM.BITNET
Message-ID: <8912010804.AA03378@ucbvax.Berkeley.EDU>
Source record: 14993

I have tried to remain on the sidelines during this latest outburst of verbose and highly annoying "noise" on the net. This whole monitoring thing is starting to sound ridiculous.

The guy who posted the pro-ECPA message (which I do not have a copy of but can pretty much reconstruct from the flames) seems to be saying that we have no business monitoring police, fire, or military transmissions. He uses the somewhat striking and baffling argument that "no moral, intelligent person" should want to.

Well, gee. I think of these agencies as public service agencies that consume my tax dollars. They work for the taxpayers. I have every right to know what's being done in a public agency. I do not believe that a public agency knows what's best for society. That kind of attitude is what causes most of the problems we have with public service agencies. Left unchecked, they will degenerate into an anarchy of sorts that is only concerned with it's own motives, not those of the people who formed the government that established them in the first place.

In the military area, the situation is very clear. If the military does not want something heard, it won't be heard. The air operations the gentleman heard are routine transmissions probably related to training and readiness exercises. Again, this is YOUR government working. You have a right to know what's going on. The military is probably the biggest offender when it comes to not telling people anything. Therefore, grab it where you can!

In the final analysis, if you monitor in the privacy (yes, I believe there is such a thing) of your own home, no one is going to hassle you. The ECPA was a law designed to sell cellular telephones. Period. Anything else is incidental. This law is a terrific example of people allowing government too much control. I don't support the ECPA and in fact I have not changed my listening habits one iota. I also do not believe that my monitoring habits are anyone's business.

Finally, let's try to bring this discussion to a close. It's like arguing religion. No one can win. I'll reply to flames or support individually.

Using a cordless phone or a cellular phone is like having a conversation at the top of your lungs with your neighbor down the street and then getting pissed because others heard the conversation. The constitution does not provide for the protection of those who insist on doing stupid things. If I heard the conversation I suppose the loud mouth would have insisted that I close my doors and windows where upon I would have suggested that the real solution would have been for him to keep his mouth closed.
By the way, I missed the posting that gave the freqs. for security in stores. Could someone repost these for me.

1) I don't really have the time.
2) According to the local FCC folk (I checked), UNLESS they're getting into some "real" device, instead of just a "part 15" device, the FCC could care less.

If you want some interesting reading sometime, read the Part 15 rules about things like portable phones and baby monitors (and garage door openers, and the new RF remote light controllers from X10 and, and....). Basically, it says that the device "must accept" interference from any and all other sources, and that if a part 15 device is interfering with another device, it's the part 15 device's problem.

However, I do happen to know a guy who's fairly high up in the McCaw organization (he's in a class I'm attending), and if I see him again, I'll probably just mention it in passing.

Mike you are right about the resolution possible when using silk screen to create a QSL. The technique you described sounds much better. Silk screen does have some advantages. they are cheap, fun to make, you are not dependent on someone else to develop or prin tthe final product. I used the silk screen process a few years back. For those interested in some details see QST Dec 1980 - I wrote an article outlining the technique I used- also got the kids involved and got their pictures in the QST.

I'm too lazy nowadays to do it anymore- " storebought" for me 8-)

(I would post this followup to 'rec.radio.shortwave' also but
Bell Labs' netnews machines do not yet receive this newsgroup.)

I second Bob's recommendation. Here is a repost of my earlier
book review:

BOOK REVIEW: ANARC GUIDE TO U.S. MONITORING LAWS

by Bob Parnass, AJ9S

Do you as a monitoring hobbyist have the right to receive
whatever radio signals you want in the privacy of your
own home? No -- not any more. So say the infamous Elec-
tronic Communications Privacy Act of 1986 and a growing
number of state laws which took away this freedom. You
can find out about these restrictions in a new 39 page
paperback, ANARC Guide to U. S. Monitoring Laws.

If you are new to the radio hobby, you might not be fami-
liar with ANARC. ANARC is not a company. ANARC is the
Association of North American Radio Clubs, a well inten-
tioned umbrella organization of volunteers who look out
for the best interests of shortwave and scanner listeners
as well as TV, FM, and MW DXers. With the able Bob Hor-
vitz at the helm, ANARC led the fight against ECPA,
against FCC proposals to let Part 15 devices run hog wild
over the spectrum, and other issues of concern to radio
hobbyists.

The ANARC guide presents the text of the ECPA and the
restrictive anti scanner laws of 14 states. Author Frank
Terranella, ANARC's legal counsel and a radio hobbyist
from New Jersey, does a good job of translating the
legalese jargon into understandable English for the aver-
age person. He even cites a few real cases in which the
laws were applied.

The guide sells for $7.50, over 19 cents per page. This
may seem expensive, but where else can you get all this
legal information in one place? I've seen only one

source which surveyed radio listening laws. Several years ago, before ECPA, Bearcat's SCAN organization published a small pamphlet with very terse summaries of state scanner laws.

As the author laments in the foreword, "it is unfortunate that a guide such as this is necessary." Do you need this guide? I think you do. Before you bring a scanner along on vacation, you ought to know the scanner laws in the states through which you drive. Being a ham radio operator exempts you from Indiana's mobile scanner law, but it would be a good idea to carry a copy of the law in your car to show police if stopped. I recall when WA2PVK had a 19" whip on his car, and was stopped by a policeman in New Jersey to see if his car contained a scanner. New Jersey doesn't exempt hams.

The ECPA stirred up a hornet's net of protest, but hobbyists couldn't compete with powerful, well funded lobbyists. It's too late to argue against passage of ECPA -- it's law now. Several radio laws are difficult to understand and the hobby needs an author skilled in the legal profession and familiar with radio monitoring to explain them. This book suits the need well.

ANARC Guide to U.S. Monitoring Laws is available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

4404. PRO 34 Mod Problems/Info

Newsgroup: rec.ham-radio
Date: 1989-11-30 17:54:49 UTC
From: stone@apple.com
Message-ID: <5521@internal.Apple.COM>
Source record: 15223

Hi,

A while back someone posted info for mods for the Pro 34. My results differ from what was expected. I wanted to restore the 66-88 MHZ band. (Why?, so I could hear if someone was using an R.C. plane on the same channel as my R.C. plane) Adding Diode 9 restored 68-88 (thats right 68 not 66). However I lost 30-54. Also, even though the display indicated 68-88 I don't think my scanner was actually recieving anything. I turned on my R.C. and it didn't pick it up. I have a PRO 2005 and it picks up the R.C. in all modes: AM, NFM, WFM. (The R.C. transmits in AM). I removed Diode 9.

The Cellular coverage restoration works fine

The Author talks about a Diode 13, I believe he was confused here. He states Diode 13 is not installed, but it is. The problem is that he saw the number 13 near the diode bank 9 thru 12. The number 13 is the pin number for the I.C. near by. All for corners of the I.C. have the pin numbers silk screened on the board.

I played with Diode 12, and didn't figure out its purpose.

Anyone else care to comment??

BTW I'm I posting to the right group, or should I be posting the shortwave group??? I don't really see a difference between the two.

Glen Stone

4405. The "right to receive"

From: cadnetix.COM!cadnetix!rusty@uunet.uu.net (Rusty Carruth)

In article <19891121181318.6.ED@PEREGRINE.SCRC.Symbolics.COM>
Ed@ALDERAAN.SCRC.SYMBOLICS.COM (Ed Schwalenberg) writes:

...lots of discussions about receiving transmissions not intended for you...
...(its a long thread, go see it in your local rec.ham-radio archive
... if you really *must* see it)...

>Governments have the unlimited right, which they have exercised in the past

I'm not sure how to reply to this statement without becoming inflamatory,
lets just go with: The above opinion depends a whole bunch upon your
philosophy of politics, governments, where rights come from in the first
place (which is actually a religious issue (oops, here come the flames!)),
and other philosophical/religious/political presuppositions you may have.

Rusty omitted the beginning of my article, where I explained that I
didn't think that the "right to receive" was granted by the Constitution
or by the Act of '34. A few people sent reasoned, reasonable replies
explaining why they thought those documents DID guarantee them a right
to receive; I respect those opinions and I hereby thank the people who
sent them.

On the other hand, many flamers sent messages of the form "I can do
anything I want with radio waves on my property!"; these people aren't
about to convince me (or their congressmen) that they have such rights
simply because of the exclamatory nature of their sentences.

I didn't and don't want to provoke a philosophical discussion. If you
can point to a "right to receive" based on a reasonable understanding of
current law, I'm interested; please quote chapter and verse. If your
belief in a "right to receive" is based on your personal belief in
anarchy or communism or someotherism, or because you think you know what
Thomas Jefferson would have thought, or because of the provisions of
English property law of the thirteenth century, I think you're just
flaming and I'll delete your message as quickly as I can.

I do not believe that the government has unlimited rights. The above
statement would indicate that Ed does (but then, he may not).

My statement that governments have unlimited rights in this area is a
statement of fact about how governments have acted and continue to act,
not a declaration of philosophy. I have carefully avoided posting my
opinion of the government and its "rights", under the assumption that
everybody out there is as uninterested in my opinion as I am

uninterested in theirs.

[rest of the article deleted]

So what is different about cellular - why is it "protected"? It's on
different frequencies, but no harder to receive. In some senses, it's
EASIER (higher power, older TV tuners tune it...).

I ask this rhetorically; I know why HBO and cellular people want protection,
I just don't think they have any more "reasonable expectation of privacy"
when transmitting in the clear (or using readily decrypted methods).

Phil,

Hmmm, the next question some might ask is: "Is the New Testament legal for an exam QSO?" According to my ARRL book "The FCC Rulebook", it says: (p.2-5, par. #1): "The message should be typical of those usually encountered while operating an amateur station on the Novice HF bands. It must be unknown to the applicant, and not be a well known phrase from a poem, song or book." Sooo... the rhetorical question: Is the New Testament a typical text excerpt from the the Novice portion of the HF bands? And further, is it "... not be a well known phrase from a poem, song or book"?

I can hear a VE now: "Do you know who Jesus is?". :-)

I don't think so. The radio act (of 1934 ?) was very specific about that. I'm sure you may recieve, and evaluate any signal you wish with no obligation. THEY HAVE AN OBLIGATION TO SECURE THIER OWN SERVICE from non-paying customers. Even if this sutuation changes, I refuse to give up such a right. I accept, however, that one may need a license to PERCHASE such detecting equipment, but I will design and build what ever I please.

>The Columbian gov't. apparently takes a real dim view of people shipping
>Nintendo games in their suitcases on airplanes. They took one such
>suitcase, and blew it up. They thought the Nintendo game was a bomb. I
>think this is good grounds for sueing the gov't.

And now for the facts: A suitcase to be loaded on an Avianca jetliner
at Los Angeles International Airport was suspected, after X-ray
examination, of containing an explosive device. The LAPD Bomb Squad
exploded the suitcase, in accordance with their standard procedures.
It was determined afterwards that the device causing the suspicious
image was a Nintendo game.

Less than a week ago, an Avianca jetliner exploded in flight, killing
all aboard. The possibility of sabotage has not been ruled out.

The owner of the suitcase will be reimbursed.

The name of the country is 'Colombia'.

>I am all in favour of
>increased security, but increased stupidity is another matter.

Agreed. What does this have to do with ham radio? Followups to /dev/null.

Neal:

This is an interesting idea, but it won't work in practice.
There are a couple of possible scenerios that could occur under this
paradigm. The payment could be extracted from the "users" of the
service; this would require a police state. I am not willing to accept
this scenerio. The other option is that the company could expect people
to be on their honour to pay. This idea has been around for a long
time, and apparently it works; consider public tv and shareware
software. Unfortunatly, our government is heading in the direction of
the police state.

Solutions: Since we have recognized that the police state
doesn't work (E. Germany, Czechoslovakia, Poland, Hungary, Soviet
Union, and it's only a matter of time until we shall hear rumblings from
mainland China again), we should not legislate "protection" for
companies providing services via RF. Companies should either provide
their services only by wire, provide a service which is paid for by
commercials, or adopt the shareware/public tv paradigm.

Every time this question pops up I find out something else about the RS discone. I have the ICOM discone. I bought it because someone said it had better performance even though it was identical to the RS discone. Well, here's what I've found out after reading several months of questions/answers:

The RS discone is cheaper, has a SO-239 connector, has HOLLOW aluminum cone elements, AND, no low-band whip.

The ICOM discone is about $30 more, has an N-type connector, has SOLID stainless steel elements, AND, a low-band whip.

So, they're not identical.

I hope this is more complete information than has been posted in the past. Oh, also, the ICOM comes with 50' of cable and N connectors. Maybe with all these little extras the ICOM is actually a good deal?

> services that are intended as programming for revenue generation. The
> providers MAY NOT DENY YOUR RIGHT TO RECEIVE, but your right to receive does
> NOT guarantee that your can receive everything for FREE!

I strongly disagree here. The providers MAY deny your right to receive
and the way they can go about this is by not beaming their signal to your
house! This can be done by using directional antennas or by landlines.
If you irradiate my house with rf, I consider it my perrogative to demodulate
it.

I consider it absolutely incredible that these outfits like HBO are sending
unsolicited movies to everyone, then getting inflamed because some of the
people who receive these the movies (and basically everybody in North
America receives them) are ponying up big bucks. What a scam! It would
be like them (without my permission) sending me VHS cassettes in the mail
and then asking me to send them money. After all, they have sent me
something of value, something "intended as programming for revenue
generation."

I have been getting free movies at home from HBO ever since I can remember
and I have never paid them a dime. In fact, I have been getting free movies
from them no matter where I go: my office, in my car, in my friend's boat
out on the lake -- even when I took a holiday in the US Virgin Islands.
I can't seem to get away from them. Well I have a message for HBO, et.
al.: Stop sending me your damned movies! I don't want them!

And they have not considered cellular yet, which basically requires barely more technology (a TV set will do) to receive. So I wonder if a case can be built on this to throw ECPA out.

> I'll probably just mention it in passing.

I think the ECPA referred to cellular communications by service, rather than by frequency, so listening to their cross products, harmonics, etc., could TECHNICALLY be just as illegal as the fundamental. Oh how the lawyers would love to continue hassling you so they can "prove" to their customers that they are "fighting" for their privacy. I wonder what laws (this is more along the lines of misc.legal) could protect you if someone ELSE's stupidity and incompetence (the manufacturer of the part 15 device) caused you to be in violation of ECPA.

Also consider, what if the device was on 900 Mhz and so was my repeater which is on the same tower, and what if it was trashing your part 15 device because the frequency was nearly the same.

It may or may not have been the fault of the cellular company, maybe their engineers are or are not competent, but their lawyer was definitely an asshole.

I have a hard time believing that I have to pay for something that comes broadcast - whether I want it or not - through my yard and property. Lets talk about the example of the play in the theater: The people can't be denied entrance on anything except non-payment for services. In other words, the visual presentation, the sound - they are not going out of that theater, and only (under "ideal" conditions) the people inside can hear it.
Now on the other hand, something like hbo (I did that on purpose) says you have to pay for their services to receive it. But if I can receive it whether they say so or not, they shouldn't be able to tell me what to do: Is that not an "invasion of privacy" (a man's home is HIS castle comes to mind...). If they don't want me watching it, they'll encrypt it (which they're smart enough to be doing). But what I do in my property with my land and my things is my business, so long as it doesn't interfere with the pleasure of anyone else (their pleasure of ripping me off excluded). So if they don't do something that either keeps their signal from coming into my home or keep me from decyphering their signal, hey, that's THEIR problem, not mine. I always say an unenforcable law is a bad law, and if their publicly broadcast information enters my home, I can and will intercept it, whether it's my right or not (finders-keepers also comes to mind...).
So my point? Anything publicly broadcast over the airwaves becomes just that: public property. If you don't like it, keep them from receiving it by using wires or encrypt it with a secure key. Because open broadcast is open season on the airwaves, and people WILL intercept it. That's all I have to say, 73's,

Say I live in Mountain View, CA and an outdoor amphitheatre is built
near me. Concerts are usually loud enough that I can hear them from my
yard. By your logic, I'd have to stay out of my yard and keep my
windows closed if I didn't want to pay.

No way.

In an age where strong encryption against anything but the NSA is
readily available, there is no excuse for satellite users to complain
about unauthorized receivers. Besides, why do you want more
unenforcable laws? More excuses for the government to spy on us to see
if we're breaking any laws.

I hate to say this, but I would go with IBM. Though IBM has the most antiquated DOS system and is by far least user-friendly of all (compared to MAC, AMIGA etc) it has the largest software base around. Its also cheaper.
This is just my humble opinion. What do I know, I own an Amiga.

The public airwaves are the PUBLIC airwaves. Phone lines are are
private hard-wired systems. Cellular phones use the PUBLIC airwaves.
Public airwaves can,and do, trespass over my personal jurisdiction ie:my
house, property etc. As far as I'm concerned, anything on PUBLIC
airwaves is fair game for interception. If privacy is of the utmost
concern, don't go PUBLIC.

I don't know where you heard this, but the RS discone uses SOLID
stainless steel elements (just like Icom's discone)

>The ICOM discone is about $30 more, has an N-type connector, has
>SOLID stainless steel elements, AND, a low-band whip.
>
>So, they're not identical.

Agreed. Someone said they attached a whip to the RS discone using
the threaded bolt on top of the "disc" elements. I suppose this
would make it somewhat similar to Icom's.

>I hope this is more complete information than has been posted
>in the past. Oh, also, the ICOM comes with 50' of cable and
>N connectors. Maybe with all these little extras the ICOM is
>actually a good deal?

Weeell.. yes and no (for me at least). The Icom has the whip!
That's the good part. The 50' of cable is RG-8U. Not bad cable
for VHF, but at 800 Mhz it has 9 dB loss per 100ft. I wanted to
listen to 800 and 1200 Mhz so using 9913 cable, I only lose 4 dB
per 100 ft. at 800 Mhz. I made the decision that I'd rather spend
$30 on good cable rather than a discone with a low-band whip (your
mileage may vary)

As I recall, I had heard that most of the Soviet and Eastern European broadcast jamming stations had been shut down a few years ago. I was rather suprised to hear what sounds very much like one of them on the air recently. Hearing another this evening prompted me to write this note.

Does anyone know the status of these stations? The one I am hearing right now is operating around 7150 kHz, and identifying with "AG AG" every 30 seconds.

I am very suprised to hear them back.

A while back, I posted a request for information on how to turn on/off the RTS and CTS lines of RS-232 via Turbo Pascal. I received several kind replies, one of which hit the nail squarely on the head (from Pete, VE7CEI):

```
Const DTRon = $01; {I use this for the key}
RTSon = $02; {This can be PTT}
Both_on = $03;
All_off = $00;
ComPort = $3FC; {$3FC is Com1, $2FC is Com2}

Begin
{Etc.}

Port[ComPort] := DTRon; {or RTSon, or Both_on, etc}
.
.
.
Port[Comport] := All_off; {When you're done}

End.
```

Nothing to it.

I haven't actually seen an IC-2400 but the Nov/Dec 1989 _Icom Newsletter_ from International Radio and Computers, Inc. [751 S. Macedo Blvd., Port St. Lucie, FL 34983 (407)878-8856] describes mods for IC-2400 which expand UHF coverage 400-479 MHz and VHF 138-174 MHz. There is also a 300 MHz mod, and a crossband repeater mod. Does anyone know if the IC-2400 in repeater mode will do offsets??

Same issue of Icom Newsletter has out-of-band mod for IC-2GAT (add a diode, no retuning). A friend did this and his rig now transmits 138-178 MHz.

The notion that an ordinary citizen could assemble unclassified, publicly available information into a "classified whole" subject to government censorship was resoundly squashed by the Federal courts about 10 years ago in the Progressive case.

For those of you who don't remember this case, the Progressive was a magazine that ran articles on the details of how thermonuclear bombs work. They worked from unclassified sources, with considerable technical assistance from a guy who knew nuclear physics, but never had access to classified information. The government attempted to prevent publication on the grounds that, even though the sources were all public and unclassified, the collection of that public information into a single place somehow still represented a threat to national security.

The court threw out this absurd notion, the government dropped the case, and ten years later the Republic still stands.

This case, and many others like it, have convinced me that the courts are about the only institution that keeps the US from turning into a police state.

I've been given the chance of a Hallicrafters S27 rx at a 'budget' price
because its not working...
(thats all the seller would say - it looks mint inside, all
the tubes are there, but nothing happens when you switch it on!).
Despite its age, i fancy it could still be a 'nice' alternative to modern
synthesized scanners. IMHO,nothing beats a free-running, nicely
weighted knob for frequency control.
Theres a full manual & schematic to come with it, and a spare set of
tubes, so fault-finding should be easy (i understand tubes better than
i ever will solid-state electronics!).
Anyone out there in Netland use one of these rigs who is
prepared to share experiences?

Hey, stuff it! You've got a perfectly good 'n' key. Use it. Or put parnass in your kill file. He provides a valuable service to those in the monitoring community who are interested in whatever might be out there, and I, for one, would feel a great loss if whiners like you succeed in intimidating him to the point that he stops posting.

From: dls@genrad.com
Message-ID: <29413@genrad.UUCP>
Source record: 15009

The Extra Ham Stack is now available for those who would like it. This is a HyperCard stack, which runs only on MacIntosh computers, and is a help for taking the Amateur Extra written test.

I also have the bug fixes for Novice, Technician, General and Advanced Ham Stacks typed into the computer, and can forward a copy to any current owners of these stacks (warning, bug fix for Novice v2.0 and Technician v2.0 only, if you have an earlier version, these won't help you). I want to apologize for the large number of typographical errors in the Technician Ham Stack v2.0....I should have held onto it longer and audited it better.... sigh.... For those who have access to ftp, the updated stacks will appear shortly on tank.uchicago.edu.

Bill,
Their stand alone modem may be synchronous, but their PC card does not require any unusual hardware (just a PC from XT types on up). I'm sure hams are not their market (at $2400 a board). It sound like a really neat device if you can afford one. My only concern is the possibility of commercial users straying into the ham bands. Its unlikely but has happened in the past. Whenever a company markets a product whose main customer is likely to be the non-ham market, and the product can operate on ham frequencies then there is a situation to be watched. Note that there is nothing wrong with selling such a product and it would be great if an inexpensive ham version were available, but in these days of relaxed ID requirements, it is difficult to tell a ham generated bust of digital data from a similar commercial burst, particularly if it uses an unorthodox modulation scheme at high bit rates. My concern is only to keep a watch out for unauthorized use of ham frequencies by commercial users. The manufacturer of the device is not, of course, responsible for such use, but their statement "Use of radio frequencies (in the range 406-470 MHz) may require prior authorization" is a bit weak.

4438. Telephone Interference

Newsgroup: rec.ham-radio
Date: 1989-12-01 21:37:49 UTC
From: nd2k@cbnewsh.ATT.COM
Message-ID: <6225@cbnewsh.ATT.COM>
Source record: 15012

Does anyone have any ideas/pointers on quieting down telephone interference? Moved to a new qth and thought Id have trouble with stereos/tv's etc. but it seems I only have telephone interference. On my phone (GE) an in-line filter like the Z100A offered at phone-center stores doesnt help. If I switch to an ATT phone no problem. So I think something inside the GE phone is demodulating the RF and its not line induced. As a matter of fact, if I wind the coiled handset line around a split toroid it reduces the interference a lot but not completely, so I think this is one of the main points of entry.

One neighbor has the reverse problem...their Panasonic phone is OK but their ATT phone is horrendous....I gave them a Z100A filter and dont know the verdict yet but in meantime thought Id get advice from the net. The neighbor on the other side of me has an ATT 1600 whom I also will give a filter. But if its like my problem then its not line-induced and wont help. It seems to be telephone-specific, an rf suppression practice I have says to bypass all components that are likely rf demodulators but this is rather broad and vague.

Seeing as the coiled cord was a culprit in my case do they make shielded coiled cord?? The 40BA capacitor and 1542A inductor mentioned in the practice doesnt seem to be available and anyway, the practice says they're only good up to 10MHz. What about those RF modified phones and handsets mentioned but not available in the phone center stores?? Does anyone know of any particular key points in the phone that should be bypassed by a 0.1 or 0.01 uF cap?? Any help would be appreciated.

By the way all Im trying to run here is 100 watts. I have a good ground, lowpass filter and have the shell of the lpf well grounded. Ive run checks with my neighbors on all other electronic equipment and no other type of interference crops up. As a matter of fact, one neighbor doesnt get cable and has no TVI even though we are approx. 60 miles from NYC TV xmitters. I thought for sure before setting up shop that this was going to be my main hurdle!!

Al Schwarz ND2K
houdi!nd2k

P.S. As a point of interest, I called up GE (for my phone) and posed as an owner with a ham living next door (actually me!!). They said that ham/cb interference they consider ***natural*** interference and would send me a filter (guess it will be akin to ATT's Z100A). They

went on to say if it didnt help, there was nothing more they or I could do!!

What worked with my 12 year old was to offer him an HT if he got a
Technician license. Once he had his Novice, the 8 year old wanted
to take the class too. For years my husband wanted me to get my
license, but I couldn't find the time to study code. When the 8
year old got frustrated, I started studying with him and I got some
more interesting code tapes (Radio School). I had my technician
within 10 weeks, it took him two 10 week classes.

I know a ham who will not approve his children getting a driver's
license until they have a license in case they have trouble on
the road. That might be a strong incentive for a 13 year old.

Re: Pay for scanning

I follow your reasoning Neal. I don't agree with it though.

A few years ago, when satellite dishes were new and expensive,
a professor my wife took a class from had a mondo setup. The local
cable company kept coming around to his house "advising" him that
he was stealing service.

His response was to write a letter requesting them to bill him.

They never did because they couldn't figure out how to do it! (And
the "advisors" went away.

For the military, it might be useful to ask the local scanners what
they know once in awhile just to get a handle on how BAD the security
really is locally. I must also note that Eugene's request was not
a breach of security. If a member of the military had replied, based
upon professional usage, then THAT is a breach. But all Eugene would
have seen was: NO ANSWER.
(An aside: Where does the US stockpile nuclear warheads? < no answer>
What is the decryption algorithm for the NSA eqpt? <no answer>

Have I broken any laws? Caused moral outrage? Whose problem is it?

For irradiating my property with movies and then demanding that I
pay for the part of the radiation that sneaks into my demodulator....
nope. It's like junk mail. It's there whether I want it or not and
I didn't ask for it. But sometimes I keep it.

There are many sources of information but I have not had
luck with most of them. But recently found good info.
See ad at bottomof page 158 of Nov 89 QST.
Rich Measures AG6K 805-482-3034 sells you a good sheet
of information and kits of parts. The parts supplied
are two chokes and two capacitors to be installed inside
the phone in a balanced pi filter configuration. It works
when a Z-100 wont touch the problem. Also he has hints for
other difficult situations. He sells the kits for $7 for
parts to cure five phones. So even though the parts are
standard his price is so low that it is worth it to get
the information. Also he is very helpful on the phone.
Another thing. The Z-100 only has two wires connected. If
you have two line phones and use all four wires you cant
use it at all. But of course you can install two of Rich's
filters inside the offending phone.
Good luck.

As a newspaper reporter and editor I routinely listen to all manner of communications, including military, airline, etc. traffic, here on Guam.

The airwaves belong to the people as a whole, not the military, not cell phone companies, police, etc., so I don't consider it as easedropping or snooping. The American people pay taxes which buy the transmitters and pay the salaries of thjose involved in communications, also making them public domain.

We

We ignore about 99999.9999 percent of the calls we hear because they don' t mean just a whole lot news-wise. The very small number we do act upon are not frowned upon by the police, etc. because they know we are doing our j just like them.

If a call comes in coded, so be it. Many of the business systems here use encryption to protect their calls' privacy. That's also their right so long as they identify their transmitter in the approved way (CW or English Voice)

The point is, I feel the ECPA is unconstitutional and in direct violation of the 1934 regulations, but I will abide by the law, and I frankly don't care to to a bunch of folks talk on their car phones, it's a waste of time for me.

Thank you for the forum.

> mileage may vary)

If all you are going to run is 50ft, and don't want to be burning up too
many bucks, and 800 Mhz and up is not the majority of what you listen to,
then the RG-8U would be a good deal as a fair compromise (4.5 db at 50ft).

But I'm like you, I'll take the 9913 or some heliax.

I once saw a PL-259 on some 7/8ths heliax. I should have cried, but instead
I laughed.

Sounds like a lawyer was trying to get creative, and the judge bought it,
even though he probably would have (and should have) ruled that way anyway.

If I am in my bedroom, in a motel room, a room in a brothel, or wherever,
then I should expect the right of privacy BECAUSE I did not intend for it
to be for anyone other than myself and whoever I was with, and it is
unreasonable to expect a secret camera taping it.

On the other hand if I set up the camera and radiate the TV signal to my
neighbor so he can see it, don't attempt to scramble it, then I cannot
expect to prevent someone else from also being able to receive it and
treat it either as public, or private to themselves.

Not all lawyers are that smart.

> I haven't actually seen an IC-2400 but the Nov/Dec 1989 _Icom
> Newsletter_ from International Radio and Computers, Inc. [751 S.
> Macedo Blvd., Port St. Lucie, FL 34983 (407)878-8856] describes
> mods for IC-2400 which expand UHF coverage 400-479 MHz and VHF 138-174
> MHz. There is also a 300 MHz mod, and a crossband repeater mod. Does
> anyone know if the IC-2400 in repeater mode will do offsets??

Is the Icom Newsletter any good? Has the IC-3210A been covered in any back issues? I talked to them on the phone (and I believe they even have an 800 number) and asked them about mods for the IC-3210A (was referred there Icom) and they said they had none. I then asked about the IC-2GAT (which is one I knew then exists, because I had it) and they said that all they have are mods for IC-2AT and IC-02AT for out of band receive (in the latter) and more audio power. It SEEMED they were really a way behind type of operation.

Now my question, to someone who reads the Icom Newsletter, did they publish mods for the IC-3210A or the IC-2GAT? It would seem odd that they would for the IC-2400A and not the others. If so, I guess the person I talked to on the phone did not know anything, or really did not want to bother looking (they sure turned me off of ever subscribing).

> Same issue of Icom Newsletter has out-of-band mod for IC-2GAT (add a
> diode, no retuning). A friend did this and his rig now transmits
> 138-178 MHz.

This is also in the Service Manual for the IC-2GAT. Look at the specs and the diode matrix for the Italian version of the radio. Find the diode that exists in the Italian version and NO OTHER.

> One thing I've found in Ham Radio is that some people like to be Lawyers
> for a day. They see not the spirit of a rule, but the printed rule. You
> could take any of these rules and mold them to your thinking. In this
> case
> I believe the spirit of the rule is to prohibit my operating a business
> using
> Amateur Radio frequencies. By stretching that to read the way your
> thinking
> is anti-american.

I guess you weren't around when the FCC told us we couldn't even use ham radio
for things like a guy mobiling home from work asking his wife by phone patch
(or directly if she had a ticket) if she wanted him to pick up a loaf of bread
at the supermarket on the way.

73 de Jim Grubs, W8GRT

:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2071--Nov. 28 1989 ::
::::::::::::::::::::::::::::::::::::
```

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by George Wood.

Packet Radio BID SCDX2071

SWEDEN--We have a change in the Radio Sweden schedule to South Asia and
Australia, beginning Friday December 1st. The broadcast at 01:00 hrs has a
new frequency of 11760 kHz. That replaces 9640.

TELEVISION--Pay television seems to be increasing in Europe. Canal Plus, the
pioneer French pay channel, just celebrated its fifth birthday by announcing
that it has 3 million subscribers, and a profit for the past year of more
than 120 million dollars. Canal Plus was Europe's first pay-TV channel, and
it's now expanding outside France. Three channels for Canal Plus have already
been reserved on the TDF-1 direct broadcast satellite, including one in
German. (Reuter)

Swedish Television has discussed a pay-TV channel, to be carried on the Tele-
X direct broadcast satellite. Unlike current European pay channels, this
would be a pay-per-view system. But the board of the Swedish Broadcasting
Corporation last week deferred a decision on the plan until later. (TT)

PUBLICATIONS--Bengt Friedewald has finally published the new edition of his
"International Listening Guide". The issue covers the period until March
24th, 1990. It lists external and home service broadcasts in English to all
parts of the world by time, and is an excellent reference, especially if
you're travelling. It also summarizes the schedules of General and World
Services in English from Radio Australia, the BBC, and Radio Moscow, the
Christian Science Monitor, and VOA. Finally, it includes a detailed database
by frequency showing which stations are on the air at various times and in
what language.

This is the same as the heart of "Passport to Worldband Radio". The tables
there are easier to read, but the ILG is much cheaper, and is to be updated
regularly. Assuming the ILG does resume regular publication now, we recommend

it and the World Radio TV Handbook as the best shortwave broadcast reference works. For more information write to Peacewood Publications, Box 1112, D-3588 Homberg, West Germany.

There are also lots of stations on the shortwave bands besides broadcast stations. Some are radio amateurs, but most are the so-called "utlity stations", such as news agencies, ships and aircraft. Joerg Klingenfuss has published a new edition of his "Guide to Utility Stations", the best reference we've seen for these activities. It's more than 500 pages long and has up-to-date listings of tens of thousands of frequencies. It also includes more exotic modes such as Fax, RTTY, and Navtex transmissions. For more information, write to: Klingenfuss Publications, Hagenloher Str. 14, D-7400 Tuebingen, West Germany.

Michel Ravigneaux has published new editions of three publications: the "French Free Radio List" (listing around 2200 stations), the "List of Radio France Stations" (in all around 50), and the "List of Pirate Stations" (including more than 500). For more information write to: Michel Ravigneaux, 21 rue de la Chatterie, F-8160 Hannogne Saint-Martin, France.

COMPUTER CORNER--IRIX, the Irish Information Exchange is a computer bulletin board catering for many specialist interests, including Ireland's changing media scene. It is available at two numbers: +353-1-88 56 34 and +353-1-83 19 08. (WRTH via "mv-eko")

AFGHANISTAN/USSR--Updating SCDX-2067, the Radio Afghanistan broadcast in English to South and Southeast Asia and the Far East at 09:00-10:30 hrs now uses 17720 and 21600 kHz. This is a relay from transmitters in the USSR. (Yukimasa Matsushita, Japan)

BELGIUM--BRT is now using 21820 kHz instead of 21815 for Dutch at 13:00, English at 13:30, and French at 14:00 hrs. These broadcasts are beamed to Southeast Asia and 21810 kHz remains in parallel. (Adrian Childs, England)

CANADA--Updating SCDX-2068, Radio Canada International's broadcast in German at 17:30-18:00 hrs now uses 13650 kHz. 5995, 7235, 15325, 17820, and 21545 kHz remain in parallel. (Dr. Wolfgang Gruschel, West Germany)

COSTA RICA--With the reduction in aid to the anti-Nicaraguan Contras, the Voice of America has ended its activities with Radio Costa Rica, a station set-up to circumvent the country's law preventing foreign interests from owning broadcast outlets. According to "mv-eko", the VOA has dismantled its station on 930 kHz in Ciudad Quesada in northern Costa Rica. Sixty percent of Radio Costa Rica programming had been a relay of the VOA in Spanish. Some of those programs can now be heard on Radio Centro in San Jose (820 kHz), Radio Monumental in San Carlos (1140 kHz), and Radio Cima in Ciudad Quesada (1500 kHz). ("mv-eko")

CUBA/USSR--Radio Habana Cuba is now broadcasting to Europe, Africa and the Middle East via transmitters in the Soviet Union in French at 19:00 and English at 20:00 hrs on 11850 kHz. There's another broadcast in French at 21:00 hrs and in English at 22:00 hrs on 7215 kHz. (Herbert Aichele, West Germany)

ECUADOR--Updating SCDX-2066, the now once-a-week "DX Partyline" is broadcast Monday evenings local time in North America (06:00 hrs on 6230, 9745, and 11775 kHz), and Saturdays to Europe (at 08:00 hrs on 6050 and 9610 kHz) and the South Pacific (10:30 hrs on 9745 and 11925 kHz). "Ham Radio Today" continues to be broadcast on Wednesdays, at the same time and on the same frequencies as "DX Partyline". (HCJB)

The European transmission in Czech at 05:00, Nordic languages at 05:30, German at 06:00, and French at 06:45 hrs now uses a new frequency of 6130 kHz. (Lubomir Stejskal, Czechoslovakia)

FRANCE--The Radio France International broadcast in English to Southeast Asia at 14:00-14:30 hrs is now using 21770 kHz, as well as Chinese relays on 4130 and 7125 kHz. (Yukimasa Matsushita)

GIBRALTAR--The British Forces Broadcasting Service now has two channels in Gibraltar, both using only FM. BFBS-1 uses 89.45, 93.5, and 97.8 MHz; and BFBS-2 uses 99.5 MHz. Both are 24 hours a day. (Juan Luis Lozano Rodriguez, Spain)

INDIA--All India Radio is now broadcasting to Europe in English at 18:45-19:45 hrs on 7412 and 11620 kHz and 20:45-22:30 hrs on 7412 and 9910 kHz. (Walter Olvik, Sweden)

INDONESIA--The Voice of Indonesia is testing on a new frequency of 9675 kHz. This is for broadcasts in Spanish at 17:30, German at 18:00, French at 19:00, and English at 20:00 hrs. The closing announcement still mentions the old frequencies of 7225, 11790, and 15150 kHz. (Andreas Kuppert, West Germany)

ISRAEL--Once again Kol Israel plans to broadcast live Christmas Eve mass from the Church of the Nativity in Bethlehem. The broadcast is scheduled to begin at 21:50 hrs on December 24th, and the frequencies are 7462, 9435, 9930, 11605, 13750, and 15615 kHz. The French program at 22:00 hrs and English at 22:30 will be pre-empted for the live broadcast. Note that there may be changes caused by the Palestinean "Intifada" in the occupied territories. (Harry Niebuhr, West Germany)

JAPAN/GABON--Radio Japan is broadcasting in Portuguese and Spanish 09:00-10:00 hrs on 11875 and 21630 kHz. There are also broadcasts in English, Portuguese, and Spanish 02:00-04:00 hrs on 11875 and 17835 kHz. 15325 and 15350 kHz are in parallel from the relay station in Gabon. (Carolina J.G. Vandenberghe, Argentina)

JORDAN--The new Al Karanah transmitter on 207 kHz has been heard by the EBU monitoring station in Finland. This computer-assisted system has been built by the Swedish-Swiss multinational ABB. The new transmitter in Ajlun on 1494 kHz has also been heard. ("mv-eko", Sweden)

Radio Jordan has also replaced 6145 and 6125 kHz with 6135. This is parallel with 13655 kHz for English at 06:35-14:15 hrs. (Rumen Pankov, Bulgaria)

NORTHERN MARIANA ISLANDS--Updating last week's report, here is the complete new KHBI schedule:

To the Pacific: 08:00-10:00 hrs on 17855 kHz, 12:00-14:00 hrs on 15285 kHz, and 18:00-22:00 hrs on 17770 kHz.

To Southeast Asia: 00:00-02:00 hrs on 15445 kHz, 06:00-08:00 hrs on 17855 kHz, 10:00-12:00 hrs on 15115 kHz, 12:00-14:00 hrs on 9465 kHz, and 22:00-00:00 hrs.

To South Asia: 04:00-08:00 hrs on 17780 kHz, 10:00-12:00 and 14:00-18:00 hrs on 9530 and 15385 kHz, and 22:00-00:00 hrs on 15405 kHz.

To Japan and Korea: 08:00-10:00 hrs on 9530 kHz and 20:00-00:00 hrs on 9455 kHz.

And to Japan and Europe 18:00-20:00 hrs on 11980 kHz. (Yukimasa Matsushita)

PAKISTAN--The General Overseas Service of Radio Pakistan broadcasts in English 16:00-16:30 hrs now on 13665, 15605, 17565, 17895, 21480, and 21740 kHz. Slow speed news is at 16:15 hrs. (Friedrich Buettner, West Germany)

PANAMA--As protests continue against Panama's strongman General Manual Noriega, BBC Monitoring has relayed reports from wire services about a clandestine TV transmission on November 5th. The broadcast of a Panama Defence Forces that is networked nationally every Sunday was interupted by an interview with the widow of the officer who led the thwarted coup against General Noriega two days before. The pirate broadcast was reported to have lasted 15 to 25 minutes on TV channel 12, and is also reported to have been carried on FM 99 MHz. (BBC Monitoring)

PHILIPPINES--We've had many differing reports about the English schedule from Radio Veritas Asia recently, and sometimes it has been hard to know what were the new frequencies and what were the old ones. Jaap van der Wees in the Netherlands gives us what seems to be the latest word. Until November 6th, he says, Radio Veritas announced 9525 and 15445 kHz for the broadcast at 15:00 hrs. Beginning November 7th Radio Veritas announced 11740 and 15445 kHz for this broadcast. The station also announced 15360 and 17800 kHz for the broadcast at 01:30 hrs. (Jaap van der Wees, Netherlands)

UNITED KINGDOM--The BBC is to introduce its new Radio 5 service in August, 1990. It will be the first new domestic national network for 23 years, and will use Radio 2's current medium wave channels--693 and 909 kHz. Radio 2 will then be FM only. Radio 5 is to broadcast sports and education programs, and highlights from the BBC World Service are also promised. (Norman Davies, England)

The latest edition of "London Calling" from the BBC World Service, has an interesting article about BBC Monitoring. The 50 year old organization is in the midst of a 8 year GBP 18 million modernization program to bring it into the computer age.

USSR--Updating last week's report, Radio Vilnius in Lithuania is broadcasting in English at 23:00 hrs on an unannounced frequency of 17665, in addition to the frequencies previously mentioned. (Herbert Aichele)

A new youth station is to go on the air in Vilnius. It will broadcast on FM 73.34 MHz in stereo, with music, discussions, and reports on youth life.

(Anthony Barrett, England)

YUGOSLAVIA--Radio Yugoslavia is broadcasting in French: 17:00-17:30 hrs on 7215, 9620, and 15165 kHz; 21:30-22:00 hrs on 5980, 7215, and 11735 kHz; and 00:30-01:00 hrs on 5980 and 9620 kHz. (Tony Legendre, France)

Radio Yugoslavia is broadcasting in English: 01:00-01:45 hrs on 5980, 6005, and 11735 kHz; 13:00-13:30 hrs on 11735, 15165, and 15325 kHz; 19:30-20:00 hrs on 5980, 7215, and 11735 kHz; and 22:00-22:45 hrs on 7215, 9620, 9660, and 11735 kHz. (Azam Khan, Pakistan)

UNOFFICIAL RADIO--With the Vietnamese withdrawal from Cambodia, the fight by the Khmer Rouge guerillas and their allies to recover the country has renewed. In SCDX-2058 we mentioned one anti-Cambodian government station, the Voice of Kampuchea. Another rebel station is the Voice of the Khmer (Samleing Khmer), which according to the rebel's "NCR Bulletin" broadcasts 22:30-03:00, 04:00-07:00 (Sundays 08:00), and 09:00-14:00 hrs on 1200, 1250, and 6325 kHz. ("NCR Bulletin")

The Voice of the National Army of Democratic Kampuchea has announced it is now broadcasting: 23:15-02:00, 08:00-09:00, and 10:00-16:00 hrs. (BBC Monitoring) No frequency was indicated, but the Khmer Rouge Voice of Democratic Kampuchea has been reported on around 6975 kHz. (DX Editor)

UNKNOWN--Chetan Kumar tells us about a program called "Network" advertised in a local newspaper as broadcasting to India at 15:00-16:00 hrs on 9590 and 15325 kHz. According to information from the address in the ad, the programs are supposed to appeal to people aged 15 to 30 and feature world and sports news, hi-tech information, drama, short stories, quizzes, and lots of music. This mysterious station has a mailing address in Madras, but doesn't mention where they broadcast from. (Chetan Kumar, India) Anyone know anything about this station, or whether it is even on the air? (DX Editor)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
02:30 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21655 kHz (East Africa)
18:00 hrs on 1179, 6065, and 7265 kHz
21:00 hrs on 1179, 9655 and 11705 kHz
23:00 hrs on 1179 kHz
00:00 hrs on 1179 kHz

And to Asia and the Pacific:

12:30 hrs on 15190, 17740, and 21570 kHz
14:00 hrs on 11905 and 17740 kHz

01:00 hrs on 7225 and 11760 (from December 1st) kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 50 contributors this week Good Listening!

SpaceNews

MONDAY DECEMBER 4, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* STS-32 NEWS *

US Space Shuttle "Columbia" is currently located at launch pad 39-A at KSC in preparation for mission STS-32 in late December. The Countdown Demonstration Test began last Thursday, 30-Nov-89, during the morning at the T-minus 24 hour mark, and led up to a simulated ignition of the main engines at 11:00 AM EST on Friday. The STS-32 flight crew arrived at KSC last Monday evening for the pad rollout of Columbia and for the practice countdown.

* STS MISSION CHARTS *

Space Shuttle mission charts are available free from NASA. These charts are world maps containing groundtrack data and locations and ranges of Shuttle tracking stations, and can be used with "SPARK" kits to make visibility predictions of the Space Shuttle. A mission chart for STS-32 may be obtained by writing:

SPARK
AP4
NASA Johnson Space Center
Houston, Texas 77058
USA

* MIR NEWS *

The Module-D, or air-lock module, launched to Mir on 26Nov89, is experiencing problems. Now referred to as Kvant-2, it is nearly twice the size and mass of the Kvant-1 astrophysical module that has been attached to Mir since April 1987.

A partially deployed solar panel resulted in both a reduction in some operations and the re-orientation of Kvant-2 to conserve power and maximize the sun's illumination on the solar panels to recharge the batteries on the spacecraft. Mir cosmonauts Alexander Viktorenko and Alexander Serebrov will try to make repairs on the solar panel shortly.

Earth observations of Kvant-2 show it to be a very bright object with a magnitude comparable to the planet Venus. The eastern US should have several excellent opportunities to view the Mir/Kvant-2 complex in the early evening sky this week and next, weather permitting!

* JUPITER ON 21 MHz *

Bob (KC2WZ) reports that the December 1989 isssue of "Sky & Telescope" magazine (page 628) carries an interesting article on receiving Jupiter's "decameter" radio emissions. These radio emissions are easily heard with a simple wire loop antenna, and appear to be strongest around 21 MHz.

It might be interesting to tune the 21 MHz (15 meter) band after sunset, when ionospheric refraction has diminished and Jupiter is visible in the night sky to hear these signals across the reaches of space.

* VISIBLE SPYSAT *

A secret CIA/USAF reconnaissance satellite launched by the Space Shuttle "Columbia" on 08-Aug-89 has been seen tumbling by astronomers in seven countries. Photographs of the spacecraft show brilliant flashes of light every second, as the spacecraft tumbles and reflects sunlight. The flashes of light are of a gold color, and are mostly 3 to 5th magnitude, but can exceed 1st magnitude at times.

OH BOY!....Looks like things are really gonna get stirred up over here on USENET. I was relieved when this stuff by Grubs finally died down on Fidonet, but as I said, "JIM JUST LOVES TO ARGUE!"

Anyway, as I said earlier, (don't worry Novices or ham wannabees, the ham world is not as nasty and treacherous as Jim would have you believe) there is no legal problem with testing a radio before you buy it. There is no law against it, as long as you are licensed, and no one has ever been cited for it.

Regarding Jim's remark claiming that I said that the FCC does not issue ham licenses, again Jim is VERY confused. Someone (was it Jim?) involved in the big fight Jim stirred up on Fidonet claimed that one of the reasons that it would be illegal for a licensed ham to try a Tandy 10 mtr radio in the store is because THE STORE DID NOT HAVE A *SEPARATE* STATION LICENSE! Of course, after I pointed out that the FCC had not issued SEPARATE station licenses for many years, Jim now, in his typical fashion, claims that anyone who disagrees with him thinks that an FCC license is not needed to operate an amateur radio!

I merely pointed out to the assembled (now thoroughly confused) Novices and prospective hams that the station location shown on the license does not preclude operation from other locations. Of course, this kind of "loose" interpretation makes Jim Grubs VERY angry.

In closing, I am going to ask Mr. Grubs to test his theory about trying a radio before buying is a federal crime.

On Saturday, December 9, 1989 I am going to walk into Amateur Radio Supply Co, 6313 13th Ave S, Seattle, WA and TRY A RADIO BEFORE BUYING IT! For your convenience, I will call CQ with my call, KT7H, and use an antenna that is on the roof of the store, and will transmit on 14.300 MHz SSB. This will take place sometime before 2100 UTC.

PLEASE, PLEASE, MR. GRUBS, QUIT MISINFORMING THE NEWCOMERS TO THE HOBBY AND PLEASE *HAVE ME ARRESTED* !

The phone number of the local Seattle FCC office is 206-764-3324.
The number for the local FCC monitoring station is 206-354-4892.
If for some reason (?) the FCC is not interested in pursuing the perpetrator of this dastardly felony, you may be able to stir up some interest by calling the local Amateur FCC Auxillary at 206-226-4222. Ask for Millard Gibson, W7JIE.

73!

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

4458. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1989-12-02 21:27:12 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8912030808.AA08706@ucbvax.Berkeley.EDU>
Source record: 15081

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

4459. Postings from Jim Grubs

Newsgroup: rec.ham-radio
Date: 1989-12-02 22:40:47 UTC
From: mgb@APG-TECNET.APG.ARMY.MIL
Message-ID: <8912022240.AA27458@apg-tecnet.apg.army.mil>
Source record: 15082

NOTE TO MR. J. GRUBS: THIS POSTING IS NOT FOR YOU EVEN THOUGH YOU ARE
IN THE SUBJECT LINE. I REALIZE THAT IT IS A PUBLIC BROADCAST THAT GOES
OUT ALL OVER THE WORLD AND THAT YOU CAN RECEIVE IT, BUT I DO NOT INTEND
IT FOR YOU. YOU ARE DIRECTED TO READ NO FURTHER! I KNOW THAT YOU WILL
ABIDE BY THIS DIRECTION, BECAUSE IF YOU DON'T YOU WILL BE EAVESDROPPING
ON MY CONVERSATION!

:-)

samsung!usc!cs.utexas.edu!asuvax!stjhmc!f1.n234.z1.fidonet.org!Jim.Grubs
@think.com (Jim Grubs) writes:

<previous posting deleted>

>I guess you weren't around when the FCC told us we couldn't even use
>ham radio for things like a guy mobiling home from work asking his wife
>by phone patch (or directly if she had a ticket) if she wanted him to
>pick up a loaf of bread at the supermarket on the way.

Jim, is simply one amazing fella! I read a previous persons comments (on
this net) about how he felt that Mr. Grubs was really only a rabble rouser
and got his kicks from stirring up a hornets nest and then sitting back
and watching the ruckus.

I took all that "with a grain of salt" but now am ready to agree that his
comments are not really directed towards discussions on a particular subject
but are instead intended to simply start RAGING DEBATES on anything that
he can think of.

This latest posting on his part is simply an attempt to fan the flames on
another PIZZA WARS battle. I.E. "Just what can a ham do with an autopatch?"
This subject was beaten into the ground a month or two ago, and here he goes
trying to start it up again.

People of the net-world.... when you get postings from Jim Grubs, don't
read what he is SAYING and react to it.... that is JUST what he wants,
and you are being played for suckers. Instead try to imagine WHY he is
saying what he is, and the big light will go on for you as it did for me.

And Jim, if you are reading this and have gotten this far.... How dare you!

Mark Bitterlich

>>Computers, Inc. [751 S. Macedo Blvd., Port St. Lucie, FL 34983
>>(407)878-8856] describes mods for IC-2400 which expand UHF
>>coverage 400-479 MHz and VHF 138-174 MHz. There is also a 300 MHz
>>mod, and a crossband repeater mod. Does anyone know if the IC-2400
>>in repeater mode will do offsets??

>Is the Icom Newsletter any good?...

Frankly, not very. But it has no competition; it's the best source of collected mods I know (they also publish Yaesu and Kenwood newsletters). Their published instructions for mods are often abbreviated and ambiguous (but all I have tried have worked). They claim copyright on info taken verbatim from this newsgroup (I know because I discovered some of my own writing in the Icom Newsletter).

>Has the IC-3210A been covered in any back issues?...

I don't have a complete set. The 1989 index does list out-of-band and crossband repeater mods for IC-3210A.

>It SEEMED they were really a way behind type of operation... they
>sure turned me off of ever subscribing).... --Phil Howard, KA9WGN--

I get the impression from reading their catalog that they sell lots of ham equipment to non-hams. I'm not sure I like being on their mailing list.

4462. Pueblo West vs. Ham Radio

Newsgroup: rec.ham-radio
Date: 1989-12-03 07:31:18 UTC
From: Jim.Grubs@f1.n234.z1.fidonet.org
Message-ID: <9001.2578CE52@stjhmc.fidonet.org>
Source record: 15085

There have been a number of rather confusing messages posted about the situation in Pueblo West, Colorado. To see if I could sort things out a little more clearly, I called Chris Knight, N0IJK. The story as he related it to me is this:

First, we are definitely dealing with a situation involving a homeowners' association architectural committee attempting to sue in court to get a real estate deed restrictive covenant enforced against an amateur, Mr. Charles Landers, W5QZS, and order him to dismantle his Butternut HF6V antenna and remove his transmitting equipment from the premises.

The removal of the antenna is being sought on the grounds that it is an ugly eyesore. The removal of the equipment is being sought as apparatus that creates a nuisance by causing interference with telephones and entertainment devices.

The amateurs of Pueblo West (12 in number) have all been ordered to submit applications for covenant restriction variances. Mr. Knight stated that the W5YI Report statement that all 12 have already been ordered to take down their antennas and get rid of their equipment is in error. Two of them have already knuckled under and removed their antennas and radios. Mr. Landers is so far the only one legal action has been initiated against. This is because he announced he would refuse to submit an application, which later may prove to have been a tactical error.

Mr. Landers and Mr. Knight have been in contact with ARRL HQ and the League's counsel, Chris Imlay. The latter is reported to have stated that the situation is very grave because in the case of deed covenants the homeowner is presumed to have read the covenant and agreed to its terms before purchasing the property. Landers and Knight have also been supplied with the League's "PRB-1 Kit".

Mr. Landers is reported to be willing to spend up to $15,000 in his own legal defense. However, preliminary estimates of legal fees and other costs have been set at approximately $65,000. Mr. Landers is therefore willing to accept donations. The details of when, where, and how to make donations will be announced later. Mr. Landers has also been quoted by Mr. Knight as stating that he will donate a portion of any damages he may receive from any countersuit to the ARRL Legal Fund.

During my conversation with Mr. Knight he stated that the home owners' committee is being used by one of its members to settle a personal grudge against Mr. Landers. Three dogs owned by the committee member and roaming at large attacked Mr. Landers' dog while he was walking it near the committeeman's home. Mr. Landers reported him for violation of the leash law, and the vendetta ensued. Since the committee member apparently realizes he

can't get away with selective enforcement, he is converting it into an attack against all hams living in the subdivision.

The committeeman is also charging that Mr. Landers' radio equipment interferes with his telephone. However, he refuses to permit tests by the telephone company, and even his wife is reported by Mr. Knight to have denied the interference story. Mr. Landers is not without his local supporters. More than 360 of his neighbors have signed a petition stating that they do not consider the antenna to be an eyesore and that they have suffered no interference.

How this all will turn out, I do not know, but I will try to keep you up to date. I have urged Mr. Knight and/or Mr. Landers to acquire DIRECT access to Fidonet/Usenet for the purpose of providing more direct and more timely contact with us. I hope they will be able to do so soon.

In article <6589@lynx.UUCP> neal@lynx.UUCP (Neal Woodall) writes:
>My point was that it is illegal to receive the services without *paying*
>for them. The point I was trying to make is that you have a right to
>receive anything, but that a victimization occurs if you receive a service
>that is intended as a revenue-generating product or service and you do not
>pay the fair market value for the service.
>
>Your "right to receive" does NOT end just because someone intends that
>certain programming be paid for by the receiver. You still have the
>"right to receive".....the program provider cannot stop you from receiving
>the signal, but you should pay for the service, just like the intended
>audience.
>
>You have an absolute right, IMHO, to receive ANYTHING that is broadcast
>over the public's radio spectrum, but this does not mean that you can
>get away with not paying for certain services!

If I understand Neal correctly, he is asserting I have an absolute
right to receive, demodulate and display the intelligence contained
in any radio signal that I can pick up, but I have no unconstrained
rights of any kind whatsoever to make any use of the information contained
therein.

Specifically, he asserts that the owner of the information has the right
to collect revenues from me for its use by me, and I no right to use it without
paying the customary charges for such use to such owner.

Neal fails to answer a couple of obvious questions that occur to
me - suppose the owner of the information doesn't want me to use it at
all, is he entitled to refuse to sell it to me at all or to charge outrageous
prices (sort of what HBO currently does to private dish owners) ? Is there
some doctrine in Neal's vision of "moral law" that requires the information
be sold a "fair price" ?

And why, if the right to use information intercepted from a radio
source is limited by the requirement to pay for it, is it not perfectly
consistant for people who want their communications to be private to claim
that they are running a real live soap opera for profit, and that the right
to listen to their communications (and thus use their information) requires a
payment of $1,000,000 per minute in advance ?

Neal might argue that this exagerated price
is not a fair price, but it is quite clear to me that in a true economic
sense the right to listen to someone elses communications is in fact something
that has a demonstrable economic value to those who practice this hobby. I
would assert that the right to *not* be listened to also has an economic value

which for some people under some circumstances is probably quite considerable. And why should I not price the right to listen to my cell phone conversations at a high enough figure to compensate me for the indignity of having someone silently slobbering over my every word when I call my mistress ? (I might hasten to add that in real life I currently have neither a cell phone or a mistress, but that is another story).

In short I would like Neal to explain what exact rights to information transmitted by radio are forfeited by the user of a radio system and what are not ? It seems extremely odd to me that only the right to receive payment for the use of pay-for-use information is preserved; and I do not understand how he derives this odd conclusion.

Perhaps the only rational view is that Neal sees someone using pay-for-use information received from radio as commiting some kind of fraud or theft of service entirely apart from the interception, so that if they were able to receive HBO by mental telepathy without paying for it they would still be commiting the same crime.

4464. 3rd Annual Winter Listener Festival

3rd ANNUAL WINTER SWL FESTIVAL
February 23-25 1990
Holiday Inn
Sumneytown Pike
Kulpsville, Pennsylvania

The Winter SWL Festival is a good excuse for those folks with a common interest in the Shortwave Listening hobby to gather for a weekend of socializing and meeting other SWL's. Forums and roundtable discussions will be held on Saturday for those wishing to learn more about SWL'ing or to exchange tips and techniques. Door prizes, station freebies, displays from clubs, and a banquet round out the weekend events.

Forum topics:

Basic Propagation for the Beginner
QSL Preservation and the CPRV
Antennas for the Beginner and Advanced Listener
Shortwave Accessories
What are Utilities and where to start?
DXing Helps - Books, Magazines, Clubs, Newsletters, Atlases
The Collecting and Display of Station Memorabilia
The NASWA Awards Program and Tips for Acquiring Awards
Receivers: What do you need? What to look for, what is new, and what is in the future.
The Hidden World of Clandestines
What is Pirate Broadcasting and How to Hear Them.
Scanners and Scanner Clubs
QSLing Techniques
Computers and the SWL Hobby
The Role of Clubs in the SWL Hobby

Registration Options -

FULL - Includes forums, hospitality room, lunch and banquet - $30

PARTIAL - Includes forums and hospitality room but NO meals - $15

SPOUSE - Includes hospitality room and meals - $15

Please register NO LATER than February 10, 1990. Checks should be made payable to WINTER SWL FEST. Registration for hotel rooms should be made directly to the Holiday Inn at (215) 368-3800 - As soon as possible! Special rates - $55 single, $59 double. Our function code with the hotel is WINTER SWL FEST. Please refer to this to get the special room rates. Listen to the ANARC SWL NET on 7.240 at 1500 UTC Sundays for up to the minute info.

The Holiday Inn is located at EXIT 31 of the PA Turnpike NorthEast Extension - Lansdale Interchange. Limo service is available from Phila. Intl. Airport directly to the Holiday Inn.

Please submit the following form with your registration amount to:

Winter SWL Festival

Someone asks about the S-27.....
Wow! A REAL S-27! I would have given my eye teeth for one, once upon a time. Or better yet, an S-36. If I remember correctly, both these receivers used acorn tubes (954, 955, 957) in the front end. Do you know of a source of spares of these tubes? In any case, these receivers weren't at all sensitive, by today's standards - I don't think that the term "noise figure" could fairly be assigned to them ... they would have had trouble hearing a 10 uV signal, I suspect.
Just my (poor) memory at work.
Bob, W3OTC

>INDICATE A 59 001 FROM THE SAME CALLSIGN?

They might. It depends on whose log is selected for the cross
referencing, and if they have also worked you. Typically what happens,
is that between 1 and 10 big guns have their logs selected. These logs
are compared to each other, and everybody else's log is compared to all
of these. I do not know how much checking is actually performed.
However, it can't be too much, since logs are still sent in as
handwritten copy, and must be checked by a human. It is a formidable
task, even for a computer.

Do they charge for subscriptions? If they do, this would really piss me off. I have posted mods here, and I am about to post another one in the next couple of days. If somebody is taking this information that I have written, claiming a copyright on it, and SELLING it, they are obviously doing something immoral and possibly illegal. I am tempted to subscribe before I post my next mod, and then prosecute them to the maximum extent possible if they do this with something that I have posted into the public domain.

Corollary: These guys that go to hamfests, and charge $50+ to modify radios, really bother me. They refuse to tell you exactly what the modification is, because this would of course hurt their "business." If somebody wants to pay them to work on their radio, that's acceptable to me. If people pay them because the information is not available to them about how to do it themselves, this really bothers me. Capitalizing on peoples ignorance is immoral. Keeping people ignorant by not revealing public information, just so you can take their money, is worse. (Note: This does not apply to businesses keeping trade secrets that they developed themselves. The key here is that the information is not public, and is still the intellectual property of the owner.)

FOOTPRINTS

One night a man had a dream, and in his dream he reviewed
the footprints he had taken in his life. He looked and
noticed that all over the mountains and difficult places
that he had traveled there was one set of footprints, but
over the plains and down the hills, there were two sets of
footprints, as if someone had walked by his side.

He turned to Christ and said, "There is something I
don't understand. Why is it that down the hills and over
the smooth and easy places you have walked by my side; but,
here, over the tough and difficult places I have walked
alone, for I see in those areas there is just one set of
footprints."

Christ turned to the man and said, "It is that while
your life was easy I walked along your side; but here, where
the walking was hard and the paths were difficult, was the
time you needed Me most, and that is why I carried you."

What I wonder is how the NJ law affects me if I go there with my HT which has a receive band wide enough to cover police and fire frequencies? From what I have heard, it sounds like the law would prohibit having it in the car. Can it be carried in the trunk? Since most HTs made today have extended receive coverage, what do NJ hams do?

4472. modifications for Kenwood th-X5at handhelds

Newsgroup: rec.ham-radio
Date: 1989-12-03 20:27:01 UTC
From: usenet@cps3xx.UUCP
Message-ID: <5652@cps3xx.UUCP>
Source record: 15092

In the past, I posted some mods for the Kenwood TH-X5AT series of HTs. My previous posting had some minor errors, and left some questions unanswered. Yesterday, I helped a friend modify his TH-45AT, and some of these questions were answered. This posting will clear up the problems in the previous posting, as well as contain all of the important information from the previous posting. You may delete your previous copy of this information, and replace it with this one.

Copyright (C) Notice: Some people have been taking information posted to this network, publishing it, and selling it. Not only is this immoral, it is also illegal. You may not do this. I give everybody the right to copy this material, and give it to others. You must not sell it. You may NOT include this information in a newsletter or compendium that you charge for, but you may incude it in a free newsletter or compendium. You may NOT distribute this information on a computer bulletin board system that users are charged any fees for, but you may distribute this information on a computer bulletin board system if you provide the service free of charge. You must not alter the information provided here in any way, including removing this copyright notice and/or removing the authors' name and/or e-mail address at the end of this message.

Here are some mods for the TH-25AT and the TH-45AT. Please note that I do not encourage transmitting on a frequency for which you do not have a license, nor do I encourage transmitting in the United States on a non-amateur frequency with equipment that has not been FCC type accepted. This is illegal in the United States, even if you have a license to transmit on the given non-amateur frequency.

First let me recommend that you buy the service manuals for these radios. The service manual is not expensive (about $15 I think) and it will greatly help you in performing these mods.

Before performing any of these modifications, make sure you know what's in your memories, because they will be lost.

Look at the schematic for your radio. In the lower left hand corner is an IC labled IC2. This is an ASIC microprocessor. At the lower right hand corner of this uP are several diodes and pull-up or pull-down resistors. They are D4, D3, R19, R18, R28, R20, R21, R22,

R25, R26, and a couple of resistors that are not even on the schematic that attach to B2 (pin 51 on IC2) and B3 (pin 50 on IC2). The TH-45AT schematic shows R23 on the ASIC uP pin B2. Another important resistor is R27; on the schematic it is located next to the frequency selection switch EN1 above IC2. A less important resistor (for modification purposes) is R36; on the schematic it is located to the right of IC2 in line with the top edge of IC2.

The schematic for the TH-25AT shows:

```
R18-R21 R25 R26,27 R28 R36
TH-25A M,M2 -12 O X X X X
TH-25A M3,M4,X -23 O X X O X
TH-25AT K -11 O O X X X
TH-25AT M,M2 -12 O X X X X
TH-25E T -52 X X O O O
TH-25E W -62 X O O O O
```

And the schematic for the TH-45AT shows:

```
R19-R21 R22 R23 R25 R26,27 R28 R36
TH-45A M1,M2,X -21 O O O X X O X
TH-45A M3,M4 -22 O X O X X X X
TH-45AT K -10 O X O X X O X
TH-45AT M1,M2 -21 O O O X X O X
TH-45AT M3,M4 -22 O X O X X X X
TH-45E T -51 X O X X O X O
TH-45E W -61 X O X O O O O
```

where O means USED, and X means NOT USED.

Some of the above codes are:
K USA
T England
X Australia
M Other Areas

These components are found on the flexible circuit board under the display. To get to them, take the radio apart.

---

(1) Only 8 screws must be removed from the case to take the radio apart; these are the 4 screws that hold the battery clip on, the 2 screws on the back half of the case near the PTT switch, the screw on the back of the case under (and in line with) the BNC connector, and the screw on the back half of the case adjacent to the external speaker jack.

(2) After removing these 8 screws, remove the front half of the case from the back half. You may unconnect the blue plug from the touch tone circuitry on the front half of the case to make further work on the radio more convenient, but it is not necessary.

(3) Place the radio back side down with the antenna away from you. Now, unsolder the two grounding wires from the plate which covers much of the radio's circuitry. These wires are near the top of the plate and will be quite obvious.

(4) Next, remove the 7 screws that hold this plate on. 5 of the screws for this plate are up on top and are quite obvious; the other 2 are at the bottom of the plate, and may be hidden by your CTCSS unit. Remove the plate.

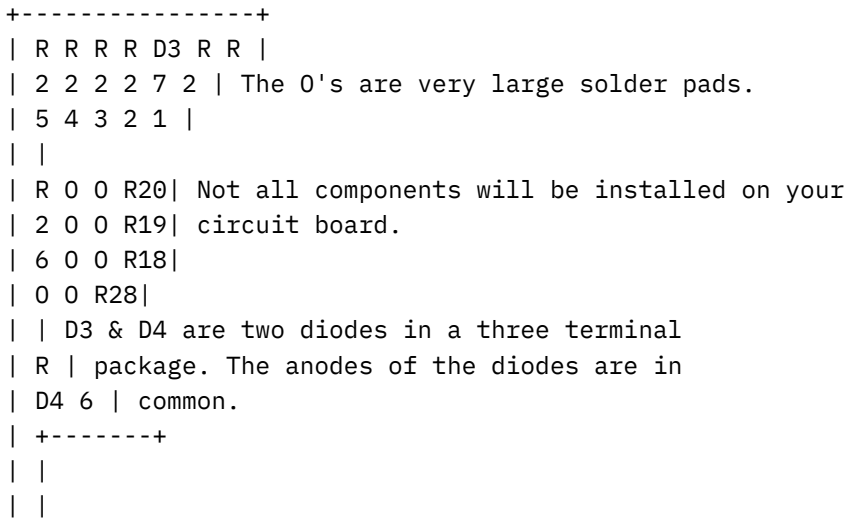
(5) Remove the red plug with about 7 wires that connects just under the volume and squelch switch.

(6) Remove the screw that holds the PTT/LAMP/MONI switch assembly; this screw is on the left side of the radio just under the PTT switch.

(7) Remove the two screws that hold the top assembly to the back case of the radio; these two screws are on either side of the orange flexible circuit board coming from the top assembly and plugging into the back case of the radio. You may need to use a screwdriver or stick to move the orange flexible circuit board out of the way in order to see these final two screws.

(8) Unplug the orange flexible circuit board from the back case. At this point, the whole top assembly should come free quite easily. The BNC connector will stay attached to the back case, and the whole top assembly will come up over it.

(9) Unfold the flexible circuit board and unfold it so that the components are accesable. One of the fold-out parts of the flexible board will look something like this: (the component side is shown up)



R R R R D3 R R
2 2 2 2 7 2
5 4 3 2 1
R O O R20
2 O O R19
6 O O R18
O O R28
R
D4 6
The O's are very large solder pads.
Not all components will be installed on your
circuit board.
D3 & D4 are two diodes in a three terminal
package. The anodes of the diodes are in
common.

The fold out board is actually square, but with only characters for graphics, I couldn't draw it that way. It comes out reasonably square on a printer with 10 characters/inch and 6 lines/inch.

On both radios, R27 is located to the right of the four blue buttons on the back of the radio (M CTCSS SHIFT REV). You should be able to see this on the back of the now removed top assembly.

On both radios, R36 is for the European tone burst to "whistle up" repeaters. R36 is located on another portion of the flexible circuit board, closest to pin 1 of IC2. IC2 is the IC closest to the portion of the flexible circuit board shown above. Most users will not want to change R36.

Here is the function of the diodes and pull up or pull down resistors (for both the TH-25AT and the TH-45AT unless otherwise specified):

D4 selects the display type.
installed: channel display
removed: normal frequency display

You probably don't want to install this.

R6 is the pullup resistor for D4. Do not remove it, so that if D4 is removed, pin 44 of IC2 will be properly pulled up.

D3 selects VHF or UHF.
installed: VHF
removed: UHF

You definitely don't want to change this!

R7 is the pullup resistor for D3. Do not remove it, so that if D3 is removed, pin 45 of IC2 will be properly pulled up.

R25 selects automatic offset selection.
installed: automatic offset selection enabled.
removed: automatic offset selection disabled.

R25 seems to have no effect on the TH-45AT.

R23,27 frequency selection step size.

Frequency selection step sizes is only known for TH-45AT.

R23 R27 frequency selection step sizes:
--- --- --------- --------- ---- ------
out out 5 and 10 kHz
in out 5 and 25 kHz (TH-45AT default)
out in 5 and 12.5 kHz (author's preference)
in in 10 and 20 kHz

R23 probably has no effect on the TH-25AT. I never checked. I was quite satisfied with the 5 and 10 kHz step sizes for the TH-25AT. I never tried changing R27 to see what would happen.

R24 ? something with the CTCSS tone ?
installed: When a TX offset is selected, the CTCSS tone
is always transmitted. The TONE button does
not work correctly. When the TONE button is
depressed, the display goes to 430.000 c, and
nothing seems to work. (A "c" is displayed
in the channel number position.) The action
of the TH-25AT is unknown.
removed: CTCSS tone selection works correctly. Both
the TH-25AT and the TH-45AT are delivered
this way.

You probably don't want to install this.

R19 function unknown.
R19 is not installed in the European version.

R20 function unknown.
R20 is not installed in the European version.

R21 function unknown.
R21 is not installed in the European version.

R19, R20, and R21 are all in parallel. Thus, if any of them
is installed, it is like all of them are installed.

R26 function unknown.
R26 is installed in the European version.

On the TH-25AT:

R22,28 select RX and TX frequency range.

R22 R28 RX range TX range
--- --- -- ----- -- -----
in out 144-148 141-163 (USA default)
in in 144-148 144-148
out out 100-200 100-200 (only where
your PLL
locks up.)
out in 142-151 ???-???

R18 exact function unknown.
installed: as delivered in USA.
removed: TX disabled from 146-148.

The RX and TX frequency range based on R22 and R28 are
unknown if R18 is removed.

On the TH-45AT:

R18,28 select RX and TX frequency range.

R18 R28 RX range TX range
--- --- -- ----- -- -----
in out 440-450 440-450

in in 438-450 438-450 (USA default)
out out 200-500 200-500 (only where
your PLL
locks up.)
out in 215-230 215-230? (PLL won't
lock up.)

R22 TX offset selection
installed: 1.6 MHz offset (perhaps for 220, or Europe)
removed: 5 MHz offset (USA default)

PLL adjustment
--- ----------

I have found a quick and easy way to retune your PLL (in the TH45-AT) with a minimum of test equipment. All you need is a scope and a small tuning tool. First, take off the battery pack holder plate. Then, remove the silvery sticker covering the tuning pot access holes. If the radio is positioned on its back, with the top folded over so that the touch tone pad is also facing down, the test point you want (TP1) is on the bottom half of the radio, near the center (left to right), and close to the battery; the tuning pot you want (TC1) is on the bottom, and closest to the PTT switch. Under no circumstances change the tuning of TC51. This is used to calibrate the output of the radio with the display the radio is giving; you don't want to mess with it. Once again, the Service Manual makes it very clear where these points are, if you are having trouble with my descriptions. On with retuning the PLL. With the radio on, and receiving, monitor the voltage and the waveform on test point TC1. Tune the radio DOWNWARDS in frequency until the PLL unlocks. Note that the radio will beep when this happens, and the waveform on TP1 will change. Tune the radio about 1 MHz higher so that the PLL locks up again, and note the voltage on the testpoint, TP1. Now, tune the radio to the LOWEST frequency that you want to be able to receive. (Be very careful when you adjust TC1. If you are not careful, you could break TC1 loose. This will cause your radio to have microphonics. Mechanical vibrations will change the value of this capacitor, and thus change the tuning on the PLL. If you encounter this problem, you can repair it by dripping wax through the small hole onto TC1, or by replacing TC1. It is of course better not to break it in the first place.) Adjust TC1 until the voltage on the test point TP1 is the same as what was noted earlier. Button the radio back up, and you're done. You will not be able to tune the PLL to any range you want. There are limits. On my radio, I have been able to retune the radio so that I can recieve from 439.2-468.6 MHz with a set of batteries fresh out of the charger. The tuning range will probably diminish as the battery voltage decreases. I have not retuned the PLL on my 2m HT, but I'd imagine the same technique will prove fruitful.

From: rodman@mfci.UUCP
Message-ID: <1148@m3.mfci.UUCP>
Source record: 15094

Hello netters,
I need some technical advice...

My father, KA1YZ has an IC25A mobile rig that he is trying to fix. The problem seems to be in the PLL area. He has no scope, but has a DMM and grid dipper and a 2at handheld. The symptoms are:

The radio does not function when first turned on, the lights etc. work (i.e. cpu is ok) but RF is neither received nor xmitted.

After about 15-20 minutes the radio will start to work. Turning the radio off, then on, will still have the radio working. Turning the radio off for 20min or so and you will have to wait 20min again.

The problem is not mechanically sensitive, and surprisingly, does not seem to be thermal either (dispite the above). Hitting the board with a heat gun does NOT make it come up quicker, freezing the board doesn't cause it to stop working when it is.

The voltage on the VCO input (output pin 16 on the pll chip) is about 0 volts on a DMM when not working and about 2.5 volts (varing with freq as it should) when working). The output of the PLL buffer amp shows good signal on his dip meter at ~120Mhz (this is correct) when it is working, nothing when dead.

Here are my specific questions:

1) Should the VCO be free-running at some wild freq even if the PLL chip is not working? The VCO seems to be not oscillating at all when radio is not working. Seems to indicate problem is in the VCO. Perhaps Q5 is dead?

2) The PLL chip has an output called "LD" (pin 18) which is said to be a lock detect output from the chip. This pin measures about 6.3 volts whether the radio is working or not. Unfortunatly the book doesn't say if it is active high or low for lock detect, but I assume it is a dc level and will not change value very rapidly and can be looked at with a meter, and not a scope. Why is this not changing? Perhaps the PLL chip is dead?

3) Is is possible that the radio behaves the way it does (slow startup) because of some cap or other device that needs to "heal"? Any suggestions on what kind of process would account for this behavior?

73's and thanks in advance for any ideas you may have, send them directly to me if possible. I assumed that the problem would be a

simple "bad connection" or thermal bad-component but doesn't seem to be the case. Due to the feedback in the ckt it is proving non-trivial to track down the source of the problem.....

>posted into the public domain.

Not necessarily. Especially with the term 'public domain' -- which implies
that there are *no* rights to the work at all. If something is in the public
domain, it is free and clear, meaning they have the same moral, ethical and
legal rights as the author, since the author, by putting it in the public
domain, has relinquished rights to it.

An argument could be made under current copyright law that there's an
implicit copyright on the material; for postings on the net, I personally
doubt that'd stick up in court. Unless you explicitly copyright a posting,
you should assume it's public domain, and once it's public domain, someone
can do *anything* they want with it. If you care about it, copyright it.

>Corollary: These guys that go to hamfests, and charge $50+ to modify
>radios, really bother me. They refuse to tell you exactly what the
>modification is, because this would of course hurt their "business."

It *is* their business. If you don't like it, there's no reason why you
can't come up with your own patch. They're under no obligation to give away
the results of their work -- and you're under no obligation to buy it.
They're not keeping you from figuring out the fixes for yourself, after all.

*** UN-INFORMED BUZZWORD WARNING ****
Why is it that people who hate those of us who get a kick out of the hobby of monitoring like to use prejudicial and hysterical words to describe us? Last time I checked there was no such thing as 'electronic voyurismm in the Calif. Penal Code.

=> > aiding
=> > >criminals to evade detection and apprehension? I think you need to recheck
=> > >your priorities.

I think you need a lesson on just how REAL crimes are comitted. I have had a fair amount of Law Enforcement training and I know of only a very few cases where monitoring equipment was ever used.

=> > How in the hell will listening to security guards catch petty thieves aid
=> > the theives in getting away?
=>
=>If you are the shoplifter, knowing the shop cop frequency is a helluva lot of
=>help.

Jim, I used to work for a large department store... let me set you straight about a few facts.

1) Most shoplifters were NEVER caught. The reason this was so was because of the large number of them at any given time.

2) The only shoplifters that were caught were caught because they were obviously doing something 'unusual'. It is generally obvious when someone is messing around with an earpiece or diddling with the squelch control under his coat. Also if you are working security you can always walk by a suspect and key your mike.... (Vissions of proximity feedback and a suspect quickly snatching the earpiece away.) [DO NOT DO THIS IF YOU WORK SECURITY OR ELSEWHERE IN THE L.E. PROFESSION. HEARING DAMAGE MAY OCCUR TO THE SUSPECT. actually dont do it wherever you work/play.]

3) The largest 'shrinkage' (denoting loss of inventory) was from employee theft, not shoplifters. The employees didn't NEED to have help from something like a freq. list as they know who security is and generally the ins and outs of the security systems.

4) The professional or accomplished shoplifters were very rarely caught. These people know exactly what they are doing and have no need of a scanner. I will not reveal details, but there are very simple things that you can do to keep from being spotted, or arrested.

5) The sheer number of shoplifters makes it totally impossible to catch them all or even a good percentage of them. If one comes in with a scanner he only makes himself more obvious. When watching for shoplifters you begin to notice things. A young person with a 'hearing aide' attached to his ear is generally out of place.

I enjoy the postings made by Mr. P. Keep em comming.

Meteors make uncommon carriers
by Michael Puttre

New York--"Look to the skies."

The slogan of Meteor Communications Corp. of Kent, Wash., is not a warning against squid-faced alien fiends. It calls attention to the technology that is MCC's name sake.

Meteor-burst communications (MBC) uses meteors to send transmissions between remote sites on the ground. Building a network that relies on shooting stars, the literary symbols of ephemerality, may sound like the product of wishful thinking. But many are looking to meteors as a low-cost alternative to satellites.

As transient as they are, meteors arrive in the Earth's upper atmosphere by the billions every day, mostly in the form of mote-like micrometeors. These visitors from space have only the briefest of careers in the ionisphere, typically under three seconds. However, high-frequency radio waves can be bounded off of the ionized gasses left behind in the meteor's fiery death dives. And their abundance makes it probable that there will be a meteor around when you want one.

Getting there

A simple point-to-point MBC system is composed of a master station and a number of remote transceiver sites. When an MBC master station wants to poll a remote site, it sends a continuous coded radio signal in the 30-to-50 MHz range. Once a meteor shows up in the proper part of the sky, the signal is reflected to a receiver at the remote site up to 2,000 kilometers distant. Once the master signal is recognized, the site transmits any data it has collected along the same path back to the master station using the same meteor trail. Sites can be relayed to give an MBC system nearly unlimited range. The actual performance of an MBC system varies due to the effects of the Earth's rotation on its axis and its revolution around the Sun. At dawn, an MBC site is on

the Earth's leading edge in its movement through space. More meteors will then be in the atmosphere above the site. In the evening, the same MBC site will be on the trailing edge, so there will be fewer meteors. In the summer, there are four times as many meteors as there are in the winter because of the density of particles in certain regions of space through which the Earth passes. One observer noted that a transmission wait of two minutes at 4:00 a.m. in September compares with a 10-minute wait at 4:00 p.m. in January.

The concept of MBC has been understood since the 1930's. But at its current level of performance, meteors will not threaten communications satellites anytime soon. In fact, the advent of commercial satellites in the '50s and '60s dealt a virtual death blow to MBC. When the U.S. military, which had been the prime sponsor of MBC, diverted its R&D money into satellites, it looked like meteors were out of the carrier business. But the technology has won out over satellites for extensive networks. The largest existing MBC network is also one of the oldest. Back in 1975, the Soil Conservation Service arm of the Agriculture Department defined a set of requirements for a system to measure snow and rainfall in the 11 continental states of the American West. The SCS West Technical Service Center in Portland, Ore., was to be the hub of a network of hundreds of widely scattered, unattended data collection sites in remote, inhospitable terrain.

Data collection leader Garry Schaefer said that the SCS eventually settled on MBC as the most cost effective solution. A terrestrial solution requiring a chain of line-of-sight relay stations was discarded because of their maintenance cost.

MBC also won out against satellites for cost reasons and, ironically, for reliability. "We didn't want to be dependent on others for a down-link," said Schaefer. "We didn't want to have to wait for irregular lease time to collect data."

The Snow Telemetry (Snotel) system today consists of two master stations and 560 remote sites. According to Schaefer, Snotel cost $5 million to build and costs $1 million a year to maintain. "Satellites would have cost a substantial magnitude more," he said.

Western Union performed the systems integrations for the Snotel MBC system designed by a group of engineering consultants who broke away from Boeing Corp. These consultants would eventually incorporate themselves, becoming Meteor Communications. The company has installed approximately 50 master sites and 2,000 remote sites to date, which represents 95 % of MBC systems worldwide.

Wishing on a star

The very importance of satellites has reawakened military interest in MBC. Communications satellites would be high-priority--and highly vulnerable--targets in wartime, and both Superpowers have developed the capability to blow them out of orbit.

This capability is not likely to extend to meteors, and therefore the military considers MBC systems "survivable." "It's a good back up for any Star-Warsiness going on," said David Kocyba, VP marketing for MCC's biggest customer.

However, Kocyba sees the real future of MBC as lying in the commercial sector. The trucking industry, for example, which represents a potential market of tens of thousands of mobile terminals, could use MBC to keep track of rigs on long-distance runs. However, MBC has to overcome its limitations before it can be considered for more mainstream communications.

"The big drawback of the system is its relatively low throughput rate of 100 to 400 words a minute," said Kocyba. Upgrading antenna design to allow the system to use even smaller meteors will increase throughput. Microprocessor enhancements will give MBC systems better definition.

A new packet-switching system is currently being perfected to replace the point-to point communications now used. Automatic routing will allow an MBC site to use one of many meteors rather than waiting for one to connect it to a specific master station. Kocyba said that some packet-switching capability is now available to MCC customers, but that the concept is still maturing. Once thethroughput and networking performance of MBC is sufficiently improved, many general-purpose communications applications will be in reach. "Voice mail is possible," Kocyba said, adding that the burst technology inhibits real-time voice capabilities. It would not, however, inhibit facsimile transmissions. Long-distance emergency communications are another application being evaluted. Some sites in the Florida Keys are reportedly looking at MBC as a back up for hurricane damage.

But even today, MBC proponents have a compelling argument to take the technology seriously. Noted SCS's Schaefer: "Meteors are free."

Try going to your local ham/shortwave radio store and check their books. ARRL puts out a book on weather fax that should explain what you need. There's a weather fax mailing list; try sending email to wefax-request@ida.org asking to be added to their list. And here's something that was posted to the storm-l mailing list:

Date: Tue, 7 Nov 89 23:02:31 E
Reply-To: STORM-L@vmd.cso.uiuc.edu
Sender: STORM-L Storms and weather related info <STORM-L@vmd.cso.uiuc.edu>
From: Eric Roskos <roskos@IDA.ORG>
Subject: Notes on Wefax Reception
To: "William T. Marchant"
<marchant@sag4.ssl.Berkeley.EDU>,
"rusty c. wright" <rusty@garnet.berkeley.edu>

Chris Novy asked me several weeks ago to write up a short discussion of what was required to receive weather satellite pictures, for STORM-L subscribers who might be interested. I've finally found some time to do it, so I am enclosing it in this message. It's written as notes rather than a polished article, but I hope it will prove useful. There are some books and addresses for equipment given at the end, as well as some information on the cost of a typical station. --E.R.

Some notes on weather satellite reception
E. Roskos 11/7/89

There are three sources of weather satellite imagery that are easily accessible by amateur users. These are HF (shortwave) broadcasts from NOAA's NMC radio station in San Francisco and the Navy's NAM radio station in Norfolk, VA; direct reception from polar orbiting satellites; and direct reception from geostationary satellites.

All these sources use variations of the APT (automatic picture transmission) format developed in the 1960s for use with fairly simple mechanical recording equipment. Surplus equipment from the 60s and 70s is available to record these images, but it is much more cost-effective to use a computer to record the images. The image quality is also usually better, except with the highest-cost equipment (surplus equipment which records on photographic film, and typically costs $1000-$2000, gives better pictures but also requires a lot of maintenance). The lower-priced (~$600) equipment either records on wet electolytic paper, which has limited contrast and limited resolution, or on plain paper using a carbon transfer process, which only gives solid black / solid white images, and is only suited to weather maps.

The APT format transmits in a raster image similar to that used by a television, but transmitted at a much slower rate: the HF and polar satellite transmissions send 2 scan lines per second, while the geostationary satellites send 4 scan lines per second. Because the data is transmitted so slowly, it is relatively easy to decode and display on a personal computer.

The following equipment is needed to receive these images:

1) An antenna. For HF transmissions, a regular long wire shortwave antenna, or a directional "beam" antenna, is used.

For polar orbiting satellites, a "turnstile-reflector" antenna is the most economical; people wanting to receive a strong signal for the longest time possible sometimes build much more elaborate, rotatable antennas, but when starting out a turnstile-reflector (T-R) antenna is adequate. It consists of four pieces of wire of a specific length, mounted parallel to the ground in an X shape a specific distance above a reflector made of "hardware cloth" wire screen. This antenna actually consists of two dipole antennas mounted at 90 degrees to each other. The only difficult part of building this antenna is that these two dipoles must be connected by a length of cable that will serve to delay the signal from one of the dipoles by 90 degrees relative to the other antenna. In reality, even this T-R antenna is not strictly necessary; a simple dipole antenna can be used, although periodic signal fading results. Another alternative is to use a discone antenna (about $90) made to receive VHF (police, fire, etc.) communications, or a VHF active antenna (about $300) if space is very limited.

For geostationary satellites, the best antenna is a dish antenna. "Loop yagi" antennas are also available that consist of a long rod with loops of aluminum spaced at specific intervals along it; I don't have any experience with these antennas, so I don't know 1sthand how well they work, but it's claimed they work reasonably well. The geostationary satellites are generally harder to receive and require more equipment, though, and the images produced by them are of relatively large areas, so polar satellites tend to be better for starting out, since they also give "close up" images of the local area.

2) A receiver. A high-end VHF scanner can be used if it provides at least a 30 MHz bandwidth, but only the higher-priced scanners provide this, since police and fire (and amateur) VHF communications use a much narrower bandwidth. A receiver with a bandwidth that is too narrow will not give usable pictures; most of the picture will have "snow" in it rather than an image. The best alternative is to buy a crystal-controlled receiver made specifically for the purpose; these are available for around $180 (plus crystals, which are around $15). I currently use a modified 2-meter amateur radio receiver, but it is not really adequate since it only has a 20 KHz bandwidth, and costs much more that a WEFAX receiver. Unless you have a receiver already that has the proper bandwidth, it is a good idea to buy one of the specifically-made WEFAX ones. In any case, the receiver must be able to receive the

137-138 MHz range; not all VHF receivers will receive this range, since it is specifically for weather satellites rather than voice.

For receiving HF images, a conventional shortwave that can receive single sideband is sufficient. The $300-range receivers work reasonably well if they are fairly stable and can be tuned precisely enough, but reception of single sideband is required.

3) A downconverter, if you are receiving geostationary images. This converts the geostationary satellite's signal from its frequency of 1691 MHz, to the 137 MHz range which WEFAX and VHF receivers receive. You don't need a downconverter for anything but the geostationary satellites (this is one of the reasons the geostationary satellites could be considered a "more advanced" satellite to receive).

4) A preamplifier. This is only necessary if your signal from your VHF antenna is not strong enough without it. If you use one, you should get one that can be mounted out at the antenna end of the transmission line, so it should be waterproof.

5) A demodulator. For polar and geostationary satellites, you need an AM demodulator; the AM refers to the fact that the audio tone produced by the receiver is a 2400 Hz amplitude modulated signal, rather than referring to an amplitude modulated carrier signal -- the RF signals from these satellites are FM. For receiving images from one of the HF stations, you need an FM demodulator, because these stations send an audio signal which varies in frequency from 1500 Hz to 2300 Hz, rather than varying in amplitude. Some of the FM demodulators you can buy (such as the A&A demodulator I use) really are just filters that convert the FM signal to an AM signal; you then have to input this to an AM demodulator to get the data you need to display the image. Thus to receive HF images you may need both an FM and AM demodulator.

6) Software to display the images on the screen. One of the better starter packages is from Elmer Schwittek in Florida; see below for his address. You can also write your own software if you are good at "real time" software.

7) A computer with a display capable of displaying at least 16 distinct shades of grey with at least a 640x480 pixel resolution; higher resolutions (720x540, 800x600, etc.) are better.

8) For the polar satellites, software for calculating when the satellite is coming by. The "ORBIT23" program on SIMTEL20 is the one I use for this, since it is public-domain.

That's basically all you need, although getting it all working, eliminating RF interference from the computer, etc., may require some general experience with radio. Receiving the HF images are the easiest, and require the least equipment and expertise, although depending on where you are and how good your antenna is, you may find the image quality is limited due to a weak signal. The signal for WEFAX images needs to be considerably better

than is required simply to receive human-readable shortwave broadcasts, since the machine will interpret the noise as part of the image. I find that much of the time I only get a marginal image here, although I have only a very small antenna, and am not in the best location for receiving the nearby station.

Here is a typical station in terms of cost:

Antenna $35 (build-it-yourself variety)
Receiver 180
Demodulators 85 (for both FM & AM together)
Software 50
====
Total $350

This doesn't include the computer, VGA board, and monitor. You can also use an EGA, but you have to have a monochrome display since an EGA can't display 16 shades of grey. There are also programs available for the CGA, but the CGA doesn't really have adequate resolution. If you are buying a new display adapter, it's best to pay the extra $100 and buy a VGA rather than an EGA; you get a lot more flexibility, and can still buy a monochrome VGA monitor for it for $120 if you need to cut costs somewhere. This is much better than buying an EGA and a color monitor, in my opinion, at least for the purpose of WEFAX images.

Following are some references and sources of equipment; I don't have experience with all the companies listed below, but they all sell equipment for WEFAX, and have been recommended by others in the past.

Books:

Martin R. Davidoff, The Satellite Experimenter's Handbook, published by the ARRL. This book is essential; it tells how to build the T-R antenna, tells about weather satellites, gives addresses to write for more information, and generally has the technical information you need to get started. Buy this book first.

Larry Van Horn, Communications Satellites, published by Grove Enterprises. This book is much less essential, but has a chapter on weather satellites that gives a lot of "vital statistics" about the satellites for those interested.

Georg Klingenfuss, Klingenfuss Facsimile Guide. A loose collection of facts about radio facsimile, particularly weather, but geared more towards European users. Klingenfuss's English is sometimes very hard to understand, and the data isn't very up-to-date compared to the other sources, but it does have some technical details not found in other books, as well as pictures -- most of the book is pictures of images from various stations, though many of them are in Europe. The equipment listed in the book tends to be high-end, expensive equipment, and isn't always the best available, so it's best not to rely too heavily on that part.

All the above books are available from most of the mail-order shortwave companies, and most are available from local ham radio dealers.

Sources:

Software Systems Consulting
1303 S. Ola Vista
San Clemente, CA 92672
(714) 498-5784

This company sells a complete package, including hardware, for $99.00. I have never used it, but it gets enthusiastic reviews from time to time on the Usenet. It seems to simply connect to the RS232 port of the PC, so I am not sure it gives grey-scale images -- maybe just black and white weather maps. It might be a good starter system for someone with a limited budget, however.

Elmer W. Schwittek
2347 Coach House Lane
Naples, FL 33942
(813) 434-2268

A good place to start; Schwittek sells three different compiled BASIC programs (object code only) for the IBM PC: one for the CGA, one for the EGA, and recently has added one for the VGA, each of which is around $50. The programs work with the demodulators from A&A Engineering (see below). The manual, though short, gives a good introduction to WEFAX, gives diagrams for the A&A boards in case

To: "William T. Marchant"
<marchant@sag4.ssl.Berkeley.EDU>,
"rusty c. wright" <rusty@garnet.berkeley.edu>

I would like to add something to Eric's posting on WEFAX reception
(although, as complete as it was, it's hard to find something to add!).

NOAA (National Oceanic and Atmospheric Administration) has a department
within it called NESDIS (National Environmental Satellite, Data, and
Information Service). NESDIS has a series of WONDERFUL publications
available concerning WEFAX, APT, the various satellites, and setting
up a station capable of receiving the different signals. The best
thing of all is that it is free! And what was very surprising was the
speed, cooperation, and downright friendliness of the people I contacted
at NOAA/NESDIS.

The person to contact is:

Ms. Mona F. Smith
E/PO2
NOAA/NESDIS
Room 806, World Weather Bldg
Washington, DC 20233

Phone 301-763-8062

In fact, I called her on the phone and found her extremely helpful and
very friendly. I received a sizeable package of information in less
than a week, which I am still going over a month later. If you tell her
what you are interested in, she can recommend the appropriate articles
and publications to get; here are ones I find worthwhile:

Educations Gude for Building and Operating Environmental Satellite
Receiving Stations (NOAA Tech Report NESDIS 44) -- this is dated
February 1989, and was written by a teacher in the science department
of a Pennsylvania high school, concerning their set up of a WEFAX
system for polar and geosynch satellites)

The WEFAX User's Guide -- need I say more?

NOAA Technical Memorandum NESS 95 -- concerns the various satellites
and what each is capable of, as well as other fascinating information

TIROS-N Series Direct Readout Services Users Guide -- fantastic

NOAA Tech Memorandum NESS 116 -- also good, giving more detailed info
about the topics covered in the two previous publications

She can also include a few other things she has at hand, plus put you
on a mailing list (although I haven't received anything else yet, so I
can't confirm this).

If you are serious about wanting to get involved in this, might as well
go straight to the source for the best information!!

4480. Nintendo

Newsgroup: rec.ham-radio
Date: 1989-12-04 04:29:00 UTC
From: LANDRETTI@VMS.MACC.WISC.EDU
Message-ID: <19120322290684@vms.macc.wisc.edu>
Source record: 15105

I lost my confidence in airport security over the past two years.
During that period I have been travelling around the country
carrying a portable packet station. I have carried it in carry-on
as well as in check-in bags. However, mostly I carry it on because
of the "apes". Only once did a security person ask to look inside
the carry-on bag and that was in the rather small Nashville airport.
I was never checked at LaGuardia, Kennedy or O'Hare.

The unusual part of it is that the station consists of a RS Model 100,
17 feet of coax, a 2 meter antenna constructed of #12 building wire
(bent in half to fit in the case), a Kenwood HT, all connecting wire
for radio and tnc, a PacComm Tiny 2 TNC, and a Radio Shack power
supply. Now, if ANYTHING might look suspicious, this bag would.
Not only should the wire create a problem but the capacitors in the
power supply should have caught SOMEONES attention.

My confidence has been badly shaken in those folks. At least they
could have asked a few questions so I would have been forced to
tell them all about packet radio. Anyway, kinda makes me wonder
if we are getting our moneys worth. Also, I'm glad I wasn't
carrying my sons Nintendo. -Greg N9HCY

Someone asked about S01MZ on 15 cw today (03 Dec). This prefix is for Western Sahara. The W6GO/K6HHD Managers' List gives the QSL route as EA2JG, but this is probably an earlier operation. The operator today said "QSL via KV4AM". I was suspicious because the signal was extremely strong - but on the other hand so was a 6W (Senegal) on 10 cw at about the same time.

If this operation is genuine, I'm surprised it hasn't been announced in either of the two DX newsletters I subscribe to. That doesn't mean it's phoney, although it's strange using the same call as that of the earlier operation from S0.

As they say, WFWL - Work First, Worry Later - I did the same as the poster. I'm not spending 50c on two stamps until I know it's real :-)

oo7@astro.as.utexas.edu

P.S. - a tip: When KV4AM operated as T30MA in March 88, he did reply to cards sent with just an SASE, but he included a photocopied note to the effect that he would have liked contributions to cover the cost of at least the cards, so if it turns out to be a genuine operation and you want a QSL card, you might want to put a dime in the envelope as well :-)

I meant to add to my previous posting that the beam heading was
correct for W. Sahara as accurately as I could tell. Of course,
this doesn't exclude the station being in NYC :-) He or she was
working mainly stations on the east coast and W5, but a PY as well,
so it wasn't *really* local.

Why am I so untrusting?

You know as well as I that the U.S. simply can not, under the
current situation, search every piece of luggage twice (or once for
that matter) due to the sheer volume.

> Then
>having everyone identify baggage before boarding (anything left is treated as
>a bomb). If a piece has been identified as suspicious, the owner can be
>asked to demonstrate that it isn't.

Identification of luggage is done in other places, like Germany. BUT,
this does not guarantee a bomb will not get on through luggage. Haven't
you ever heard of those fanatics that are willing to die for their cause?

> In addition,
>why a NINTENDO set? Doesn't a can of shaving cream look like a bomb? How
>about a tube of toothpaste? Plastic explosive can look like anything (a ski
>boot, for instance); the detonator need not look suspicious at all.

Airport security probably has plenty of experience identifying a can
of shaving cream, toothpaste,etc., and whether or not they are bogus.
The nintendo thing is relatively new. I could see how they might, under
x-ray mistake that thing (if you've ever seen one) as a timing device. And
if the earphone wires were just coiled around the whole thing, it would
look even more suspicious. The fact is, we don't know all of the facts here.
A can of shaving cream looks like a can of shaving cream, under x-ray, if
you use your imagination. But, for example, what does a can of shaving
cream adjacent to a nintendo game look like?

>No, this entire episode strikes me as extreme overreaction. Moreover, I under-
>stand that this was engineered in the US, at LAX. Could the legendary in-
>competent security people the airlines like to hire have possibly fucked up?

(Really sir, there's no call for that kind of language on the net.)
The only overreaction was by the media. This whole thing shouldn't
have mushroomed the way it did. Airport security has false-alarms all

the time. Granted, not like this one all the time, but nevertheless, they do happen. On one flight to Switzerland, my wife and I were detained at the x-ray machine when her purse went through, because they found what they thought might be bullets. What they really were was yogurt-covered almonds. For some reason, under x-ray, they looked like bullets. Even after hand inspection they would not let us touch them. I even offered to eat one, but they wouldn't let me touch them until some chief of security appeared and inspected them. I didn't walk away thinking, "God, how stupid they are," just because I knew the "reality" of the situation. I walked away thinking, "I'm glad they're that careful." I never assume I know all there is to know about security; there might be possible scenarios that I am unaware of, that might warrant such measures.
Now ask yourself, why was this nintendo thing "news"? The fact is, it wasn't. If, instead of nintendo, the thing looked like an ordinary radio like the one from the Lockerbie (sp?) incident, no one would think this episode was funny, or stupid. This thing only made the news because the media thought it would sound funny; "airport security blows up video game." I can still remember how the world news described the incident; "...after the bombsquad attempted to detonate the bomb, they inspected the remains. The suspected bomb turned out to be a video game- Nintendo."
And I asked myself, what is relevant about the fact that it was nintendo? The media still has the power to slant a story, in the most subtle way. They presented it as funny, and that's the way the average citizen soaked it up.

> as well :-)

This (contribution requests) is an interesting subject, and has
been one of hot debate in recent DX bulletins. As long as he
indicated an interest in contributions, but sent the card anyway, I
don't have a problem with this. What is scary is that some
managers toss the card without a 'donation', some mail it slow boat
unless a 'significant contribution' exists, etc. Being a manager,
i sometimes see greenstamps to help the qsl printing costs. For a
dxpedition, contributions help to pay the cost of travel,
etc....which in some cases can be a major setback if you don't get
the help.

I guess, that this falls into two areas...are you contributing to a
QSL manager or a dxpedition effort. The first is nice, but
shouldn't be a requirement (unfortunately, it sometimes is!). The
second is a measure of the value of the dxpedition to you. If it
was helpful, I would consider adding something to help out the
costs. I suspect a dime would be an insult, although something is
better than nothing. Consider adding a few stamps (if, for the
example given, the ham can use them for postage) or a greenstamp,
or an additional IRC.

>Pat Thaler KJ6PU

Of course a scanner can be carried 'somewhere' in the car. Otherwise,
how do the police suggest you get it home from the store?? I think the
law states that the scanner has to be some what disabled so that it
cannot be in a receiving condition in the car. For example, the batteries
could be removed or the scanner could be in a box, etc. Does any one know
for sure?

Subj: Nicad rejuvenation article request answered

Will Martin's address WMARTIN@STL-06SIMA.ARMY.MIL won't work from here, so THANKS WILL! and here's a synopsis (he sent me the text--what service!).

Several notes appeared in 23-Sep through about 4-Oct of 1988. Rusty Carruth (N7IKQ) reported on work he did with a NiCd charger circuit from Ham Radio mag on 23-Sep and 4-Oct. Gian Moda, I7SWA, submitted an extract of an article by Pat Hawker, G3VA, which appeared in Radio Communication for May, 1988, which sites one by J. Fielding, ZS5JF, which appeared in Radio ZS for September, 1987, and this set appeared on 29-Sep 1989.

Thanks, Will, and I hope this helps the several people who wanted to know if I got a reply.

I have getting some mail regarding the mods database. It can now be accessed through the internet. If you want to grab a file, you must FTP to HAMSTER. It does not support TELNET sessions.

FTP 129.100.22.100 login as anonymous and any password will work.

The FILES are stored in the directory called MODS. Each file is some info on a particular radio. For example: TS440.MOD is info on the Kenwood TS440 HF transceiver.

Bitnet people can still access the MODS database through mail.

4493. S27, Tubes, tuning controls.

Newsgroup: rec.ham-radio
Date: 1989-12-04 17:27:27 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <04.Dec.89.17
Source record: 15137

Yes the S27 uses acorn tubes in the front-end. 954 and 955 and so on.
I've heard of at least one S27 that was converted to use nuvistors
(6CW4) in the front-end to hot thing up a bit. But thats sacrilege!
It wouldnt look right inside anymore.

<Nostalgia-flash begins>

OK so its not the Worlds most *sensitive* receiver,
(5microvolts) and its frequency setting accuracy
is poor, but it *looks* like a *proper* radio! The lovely yellowish glow
of the dial-lights, dimly illuminating the shack, is far more restful
than the harsh green glow of the LED frequency display on your rice-box.
Even the faint touch of mains hum in the speaker adds to the enjoyment.
It makes the thing feel alive!
And i prefer free-running, spin-tuned radios to modern synthesized stuff.
Who remembers the beautiful silky feel of the National HRO5 dial (and the
hopeless log-scale-to-frequency graphs?). Or the uniquely satisfying
tactile experience of the tuning on the Collins S-line?
Modern photo-chopper-synth. tuning just doesnt have the feel - its like
using a machine, rather than an organic, living radio - 'keypad'
frequency entry is just so IMPERSONAL!

<Nostalgia-flash ends>

PJML%UK.AC.NWL.IA@UKACRL 'You can tell a *REAL* radio by dropping it
...-.- de G6WBJ on the floor. If the floor breaks and the
radio still works, then its a *REAL* radio'

4494. Wanted: Unix based satellite prediction program - source preferred

Newsgroup: rec.ham-radio
Date: 1989-12-04 17:56:23 UTC
From: john@anasaz.UUCP
Message-ID: <971@anasaz.UUCP>
Source record: 15114
Cross-posted to: rec.ham-radio,sci.electronics,sci.space,sci.space.shuttle,sci.astro

I would like to get hold of a satellite tracking program that I can
run on my 386 Unix System-V. Does anyone have source of such that
I can have? How about tracking equations for:
(1) predicting satellite position from standard element sets
(2) calculating range, bearing, and doppler from any point on earth?

Thanks in advance.

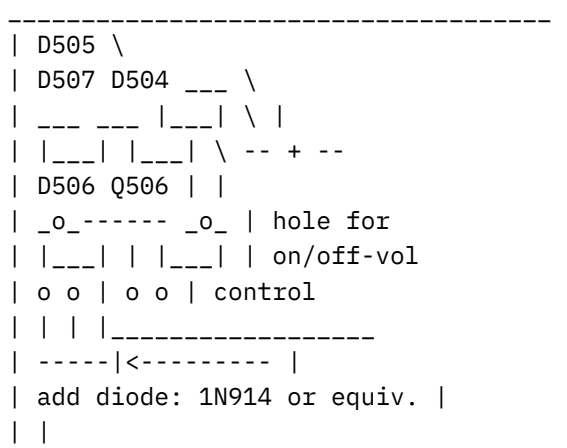
4495. Icom IC-2GAT out-of-band transmit m

Newsgroup: rec.ham-radio
Date: 1989-12-04 19:09:00 UTC
From: commgrp@silver.bacs.indiana.edu
Message-ID: <12600087@silver>
Source record: 15118

OUT-OF-BAND TRANSMIT MOD FOR ICOM IC-2GAT HANDHELD 2M TRANSCEIVER
(copied from packet radio; origin unknown:)

Back side of display board:



Connect diode between top lead of D506 and lower right lead of
Q506 as shown.

Notes: D506 may be absent. If not, remove it.
Reset CPU if needed.

A friend did this and his IC-2GAT can now transmit 138 to 178 MHz (no
RF power output measurements were made). He did no retuning, and did
not have to reset the CPU. He used a tiny axial-lead glass diode,
replaced its leads with wire-wrap wire, and encased it in shrink-tube.
The operation requires a super-tiny soldering iron. Observe CMOS
soldering precautions: Unplug the iron and ground the tip before
touching the circuit.

Remember: Except for MARS and CAP, it is illegal to transmit outside
the ham bands with non-type-approved equipment.

4496. Re: RS Discone? To buy or not to buy?

Newsgroup: rec.ham-radio
Date: 1989-12-04 19:40:29 UTC
From: jsb@hpfinote.HP.COM
Message-ID: <16170009@hpfinote.HP.COM>
Source record: 15116

You can find all the necessary design equations in the RADIO ENGINEERS HANDBOOK or the ANTENNA ENGINEERING HANDBOOK. I won't go into the good stuff here.

For the 140Mhz version that I built, you cut a half circle of the hardware cloth 23" in radius. Lace the half circle into a cone with a length of magnet wire. Don't worry about electrical contact along the seam. (you could solder it if you really wanted to) The cone should have a flare angle of 60 degrees. Cut a hole into the top of the cone so a "N" chassis connector will mount into the hole. Using four pieces of #12 copper wire laced into the hardware cloth and bent into the "N" connector mounting holes will add mechanical strength.

Next cut a circle 16" in diameter out of the cloth with one of the mesh cross points as a center. Remmember this material is 1/2" mesh so is you cut on cross points the 'circle' is approximate.

I used a 1/2" long, 1/4" dia. brass standoff with a cross cut into it to mount the top to the center connector. Place the standoff over the connector feedpoint then press the top into the slots of the cross. Solder the assembly in place. I also soldered two pieces of #12 wire along the tophat surface and through the center of the tophat. The distance between the bottom surface of the tophat and the top of the cone or "N" connector should be about 3/8". This distance and the length of the cone determine the bandwidth of the system.

Seal the back of the chassis connector with a little RTV. A little waxed cable lacing cord tied between the tophat and the cone keeps the tophat from turning.

Mount the antenna by snaking the feedline (RG-213) through a piece of 1" electrical conduit and setting the antenna on top of the pipe. The pipe sets on the chassis mount just right. Attach the support pipe to any desired base. Note: Attaching the "N" connector to the feedpoint within a 60 degree cone is a lot of fun. Nimble fingers and 1/2" mesh sure help. Finish the mechanical attachment by using the cable lacing to tie a cross midway down the cone to the support pipe.

This antenna was built as an experiment, thus temporary but, has stood up to some very healthy winds with no problem and it is hard to see from a distance. It might just stay right where it's at. I monitor as well as transmit with this antenna and as you approach 144Mhz the SWR approaches 1.7:1, drops to 1.25:1 up to 1.Ghz then climbs. I also notice several "cusps" is the SWR just above 145Mhz, but they do not go above 1.6:1.

p.s You should find 1/2" hardware cloth at any 'real' hardware or farm supply house. Some of the 'Do-It-Yourself' places may also carry it.

Experiment and have fun.

I care too. It's better to have loggings posted for the few who may have
use for them than to not post 'em at all.
Most of the time complainers are the ones who never post anything of use
to anyone, anyway.

One of the least expensive ways to receive wefax is with a Tandy Color
Computer and the pd program 'wefax'. All you need additionally is very
easy to build hardware interface. (less than 10 minutes work-time). I
used it for years with fine results.

4500. Railroad Radio Frequency List

Newsgroup: rec.ham-radio
Date: 1989-12-04 20:46:38 UTC
From: greg@ncelvax.UUCP
Message-ID: <596@ncelvax.UUCP>
Source record: 15120
Cross-posted to: rec.railroad,rec.ham-radio

This is part 1 of a 4 part posting of railroad radio frequencies. Part one includes this introductory posting, and an explanation of the various abbreviations used in the following list.

This list of frequencies has been culled from a variety of published sources as well as the actual scanning by myself and others. Particular thanks are due to Bryan Hunnell of Costa Mesa for input into this particular revision.

Permission is given to distribute these lists freely by any means provided no fee is charged. Please keep my signature lines intact so users can send me any corrections, additions or confirmations.

Where I have left areas, states or assignments blank, I would especially like information from readers to complete those sections.

Part II is a list of Railroads I have included in my list with the abbreviations I have used. I would like to correct this list to show the actual RR reporting marks. If anyone can supply this information I would be deeply appreciative.

Part III is the actual list sorted by Railroad and assignment.

Part IV is the list sorted by Frequency.

Abbreviations used in the list include;

FAP The channel number for the freqs in the RR Band
ACT Activity level, VA=Very Active, A=Active, SA=Some Activity, -=No Activity found, H=listed for historical reasons. (they may use it again)
If there is an entry in this column, it means that either I or another contributor has actually scanned for this frequency. If no entry, it usually means I got it from some published source.
input Input to a repeater, the repeater freq is usually given in the comments.
rep Repeater, the input freq is usually given in the comments
PBX The railroads radio-telephone system.

If you listen to ANY of these frequencies, please send mail to me so I can update the list. I obviously can't travel all around (as much as I would like) just listing to the radio so this list is only as good as the feedback that I get.

I would like to expand this list to cover more of the country, so if you favorite RR isn't listed, send me the numbers and locals and I'll add it to this. Please fill in all the blanks if you can.

I would also like to hear comments on the format of my list. I will attempt to respond to all suggestions, but be patient, the Navy isn't as interested in trains as I am.

This list is being maintained and produced using the Reflex database. If you would like a copy of it on disk, send me a 5 1/4" floppy with a stamped & addressed return mailer and I send you a copy of the latest version.

Greg

4505. re: NJ Scanner Law

Newsgroup: rec.ham-radio
Date: 1989-12-04 21:36:55 UTC
From: judice@kyoa.enet.dec.com
Message-ID: <8912042137.AA22997@decwrl.dec.com>
Source record: 15135

About three months ago, I was driving to work and had my BC205XLT in my briefcase. I turned it on when there was a backup on the interstate. I exited and proceded to work on local roads - forgetting to turn it off. I was then stopped at an inspection roadblock in Bound Brook, NJ!

I decided it was better to leave the darn thing there rather than start hiding it, and prepared for the worst. Neither the Bound Brook policeman nor the DMV inspector said ANYTHING about it (sitting in the center console, turned off).

I would not make a habit of using it though. While local cops probably don't care less, the State Police would doubtlessly give you a hassle over it.

First, please send any email to me via the uucp path (e.g. a!b!c), not
Internet (a@b).

In article <6589@lynx.UUCP>, neal@lynx.uucp (Neal Woodall) writes:
>
> My point was that it is illegal to receive the services without *paying*
> for them. The point I was trying to make is that you have a right to
> receive anything, but that a victimization occurs if you receive a service
^^^^^^^^^^^^^
Maybe so, but this does not make it illegal. The "victim" isn't even trying
to protect himself. I call that stupidity (or bad business, in this case).

> [description of XYS Company providing a pay service via satellite]

> Now you come along and set up your satellite dish. You have the technical
> ability to receive the signal. Now, here is the "trick": Even though XYS
> Company does not target their broadcast at individual citizens, even though
> they do not intend that the show be watched by ordinary citizens, if you wish
> to receive their program, you have the right to do so. You have the right to
> receive the signal, even if XYS Company does not want you to, and you have
> this right because they are broadcasting the signal over the public's radio
> spectrum. The only caveat is that to be legal, you must pay for the program,
> just like the intended audience.

I buy everything up to the last sentence. If they are broadcasting in the
clear over the "public's radio spectrum", why must one pay (even if their
"intent" is made clear)? Seems like a contradiction by definition. If
they don't want anyone to receive it, encrypt. Let's use your example:

> Think of it like a performance given in a public place: The group giving the
> performance may have a specific target audience in mind, and they may have
> advertised for a certain group of people to buy a ticket, but they cannot
> legally exclude any member of the public who may wish to attend....but
> everyone who attends, regardless of whether or not they are the intended
> audience, must pay for the show.

Unless I can stand outside and hear the concert. Should I have to pay if
I happen to be able to hear it without violating any laws? If the service
is good enough, I'll buy it because it stands on its own - because it's the
only way I can get it (e.g. soundproof hall), or because of benefits that
can't be obtained otherwise (being able to see the performers, getting
monthly schedules, etc.).

> Since the XYS Company is using the public airwaves for its transmission,
> anyone who desires to receive must be allowed to receive the signal, but
> they must pay just like the intended audience.

Then they aren't public airwaves. You're telling me that if Robin Williams decides to do an act in a public park with a PA system that can be heard for several blocks, everyone either has to pay or plug their ears?

If the neighbors do it in front of an open window, is it illegal if I look? Nope. If they do it with the curtains closed, is it illegal if I try to look? Yup. Reasonable expectation of privacy.

> Your "right to receive" does NOT end just because someone intends that
> certain programming be paid for by the receiver. You still have the
> "right to receive".....the program provider cannot stop you from receiving
> the signal, but you should pay for the service, just like the intended
> audience.

The REAL issue with ECPA is that certain companies felt that it was a cheaper way to guarantee their market. Rather than encrypting, an expense which would be passed on to the consumer and thus decrease the market share (probably make the service not even viable in the case of most pay tv), they opted for a law so they could prosecute, setting a few examples for the general public while keeping their market share. It's simply a bottom line dollars issue. It was simply cheaper to lobby to get the law changed. They just happen to have taken the first steps in limiting our basic freedoms, but that's OK because it benefitted their end. Good solid American socially irresponsible business.

Suppose it went the other way and the "public" forced them to encrypt (I believe this was actually discussed). Methinks there would be hell to pay. And methinks congress didn't have the guts, especially with no backing from the "public" (which was due to ignorance of the issues).

Ultimately, I think ECPA will be struck down because a) it violates the spirit of the constitution, and b) those service providers do not have a reasonable expectation of privacy.

OK, glad I cleared that up...crystal clear to me, how 'bout the rest of you? :-)

Well It depends on the type of computer you have and stuff like that
however I'm real happy with the system from Software Systems Consulting
in CA there phone # is 714-498-5784. Also look at rec.ham-radio.shortwave
for more info.

PS: SSC doesn't pay me or give me anything for free and these are my opinions.

4508. TS-680S vs. IC-726

Newsgroup: rec.ham-radio
Date: 1989-12-05 00:55:08 UTC
From: FNDDR@ALASKA.BITNET
Message-ID: <8912050806.AA13506@ucbvax.Berkeley.EDU>
Source record: 15139

I'm looking at these rigs as possible replacements for my old ham-only transceiver and my old shortwave radio, to save space, simplify wiring, and hopefully improve performance. I have the specs for both, and I've found reviews of the TS-680S. Questions:
a) I haven't found any reviews or discussions of the IC-726...anyone care to offer either?
b) Both have rather wide AM selectivity. Are these useable SWL DX radios?
c) Both have computer interfaces of some sort...is there enough information in the manuals to write control software? (One Kenwood review said their coverage of the computer interface was extremely sparse.)
I like the 726's receive sensitivity, and the 680's price...other than that, they both have various (to me) minor pros and cons, but the choice isn't clear-cut. Any advice would be appreciated.

4509. Do shielded cables on computers reduce static risk as well as RFI?

Newsgroup: rec.ham-radio
Date: 1989-12-05 01:29:34 UTC
From: rfc@briar.philips.com
Message-ID: <69679@philabs.Philips.Com>
Source record: 15131

Just wondering, would using shielded cables on your computer help protect it from static discharges from your body during the winter? Assuming that you discharge to the cable. Seems to me that you'd discharge to ground, as there's nothing else exposed, like signal wires, in this case. And you wouldn't blow up some chip that's connected to those wires.
Of course, you still could discharge into your keyboard and kill things.

Is using shielded cables for this static protection purpose worthwhile? Does it buy me extra protection?

I got the following off of a packet BBS the other day
and thought the net might like to comment.

From : N6KZB @ WB6ASR
To : ALL @ USA
Date : 891127/1728
Msgid : BF 48023@WB6ASR, 2620@WA6YHJ-1 $MODS_NO!
Subject : ILLEGAL MODS ON AMATEUR GEAR
Path : WB6ASR!AA4RE.#NOCAL.CA.USA.NA!WW6L.#NOCAL.CA.USA.NA!W6PW.#NOCAL.CA.USA.NA!N6VV.#NOCAL.CA.USA.NA!K6IYK.CA.USA.NA!KB6JES.#SOCAL.CA.USA.NA!KD6SQ.#SOCAL.CA.USA.NA!N6KZB.#SOCAL.CA.USA.NA

Several messages are circulating concerning how-to, or want-to, modify
VHF or UHF amateur gear for out of band operation. Why anyone would be
so blatant as to tell someone how, or request to violate the law is
beyond apprehension. We are not talking about MARS frequencies, but
allowing amateur gear to transmit in the commercial bands. This is
clearly unacceptable, and sysops should kill those messages when they
appear. Locally several individuals have been investigated for operating
amateur equipment in the public safety and commercial bands. Putting
your 6 meter radio on 47.42 to help the Red Cross is illegal. Operating
your Kenwood on a GMRS system or commercial UHF box is illegal.
Locally we provide the FCC enforcement section call signs of anyone
requesting how to or trying to stimulate a data base on illegal mods.
FCC type acceptance is the bottom consideration, as well as common sense.
We hope the FCC will discuss the appropriate aspects with the individuals
conerned. It is no wonder that others are able to attack our hobby,
since we provide them the ammunition to do so.
Thank you for your consideration on this.

Mike N6KZB @ N6KZB Orange Section ARRL ASM.
Telecommunications Engineer II, RCOFD.

If this is what the ARRL is doing with our dues money then
the ARRL has just lost a member.

4511. Shortwave jammers identified - repost

x
SHORTWAVE JAMMERS IDENTIFIED

by Bob Parnass, AJ9S

Until recently, shortwave broadcasters in the United States, the United Kingdom, Israel, and West Germany had long been subjected to intentional interference (jamming).1 Who jams shortwave broadcast stations?

To answer this question, an intensive investigation was conducted under the auspices of the International Frequency Registration Board of the International Telecommunication Union (ITU). A 318 page report was issued after the investigation, and the highlights will interest radio enthusiasts.2

Jamming Characteristics

Foreign language programs, particularly those in languages spoken in Iron Curtain countries, are the primary targets of the jammers.

Jamming installations fall into 2 categories:

1. Ground wave jammers are used for localized jamming, directed toward the immediate vicinity (up to 100 km) of the jammer. They are situated close to the people who are to be prevented from hearing the broadcast, and are effective in blanketing high population regions with strong signals.

2. Sky wave jammers are used to prevent people far away from the jammer from hearing the targeted broadcast.

The jamming transmitters monitored in this operation were assumed to run 250 KW power and antennas with 10 dB gain. Jammers need not provide a signal with the same field strength as the broadcast signal in order to be disruptive to the the targeted transmission. By using appropriate modulation schemes, a jamming signal can obtain 10 to 15 dB relative gain compared to a broadcast signal.

Sometimes, several different jamming transmitters are used at the same time to interfere with a single broad-

cast frequency. About 90% of the jamming signals observed during the study were accompanied by a 2 character Morse Code identifier, which presumably allows the offender's field monitoring stations to determine the effectiveness of each jamming transmission.

Monitoring Stations

Jammers were monitored for two 3 week periods3, in a cooperative effort, by monitoring stations in West Germany, the United Kingdom, Norway, Netherlands, Israel, Canada, South Korea, Japan, and the United States.

The American locations are FCC field monitoring sites, and employ Wullenweber antenna systems. The Wullenweber system consists of 60 antenna elements (monopoles) spaced around a circle (one every 6 degrees) of 140 meters in diameter. A rotating commutator, called a goniometer, is connected to each element through an appropriate delay line, and samples each element at a rate of several revolutions per minute.

The idea is that all signals coming from a given direction reach the receiver with the same phase, while those from other directions arrive with random phase.4 The system has the capability of sampling all or just a portion of the elements on a given pass and forms a visual 360 degree pattern on a CRT screen by comparing the signal strength of opposing elements.

The Adcock antenna, employed at many European monitoring stations, consists of two monopole sampling elements, usually about 20 feet apart. The system effectively rotates at about 20 - 30 rpm and may be controlled either manually or automatically. Automatic selection of the antenna rotation averages the signal for each pass. The time averaging continues to average each signal for as long as the device runs freely.

Findings

Radio Liberty and Radio Free Europe were jammed more than any other broadcaster observed in the operation. For all broadcasters, the Russian language and Polish language broadcasts were consistently jammed. Broadcasts in Czechoslovakian and Bulgarian languages were also frequently jammed.

The surveillance traced the source of most jamming to the USSR. Other jamming was traced to Poland, E. Germany, Romania, Hungary, Bulgaria, Yugoslavia, and Czechoslovakia.

Participating U.S. Monitoring Stations	
Location	Antenna Type
Anchorage, AK	fixed monopoles with goniometer
Belfast, ME	fixed monopoles with goniometer
Douglas, AZ	fixed monopoles with goniometer
Ferndale, WA	fixed monopoles with goniometer
Ft. Lauterdale, FL	fixed monopoles with goniometer
Grand Island, NE	rotating Adcock type
Kingsville, TX	fixed monopoles with goniometer
Laurel, MD	fixed monopoles with goniometer
Livermore, CA	fixed monopoles with goniometer
Powder Springs, GA	fixed monopoles with goniometer
Sabana Seca, PR	fixed monopoles with goniometer
Waipahu, HI	fixed monopoles with goniometer

Participating Foreign Monitoring Stations	
Location	Antenna Type
Ottawa, Canada	(no bearing information)
Nedhorst Den Berg, Netherlands	8 element Adcock
Norway (3 stations)	Adcock
Baldock, U.K.	fixed monopoles with goniometer
Crowsley Park, U.K.	(bandwidth measurement only)
Seoul, S. Korea	log periodic
Osaka, Japan	circular array of monopoles
Tokyo, Japan	8 element Adcock
Tel Aviv, Israel	unknown
Itzehoe, W. Germany	Adcock
Krefeld, W. Germany	Adcock
Berling, W. Germany	Adcock
Darmstadt, W. Germany	Adcock
Konstanz, W. Germany	Adcock
Munchen, W. Germany	Adcock (8-30 MHz only)

4512. HT-600 Mods

Newsgroup: rec.ham-radio
Date: 1989-12-05 04:18:52 UTC
From: lawrence@smcnet.UUCP
Message-ID: <380@smcnet.UUCP>
Source record: 15129

Does anyone have information on modifications for the Motorola HT-600 or Motorola Radius P-200 (the same radio inside) to change a 2 channel radio into the 6 channel. The EEPROM inside the unit will hold the info for channels 3-6, the binary coded decimal channel selector switch will select channels 3-6 but the darn thing won't transmit on anything but channels 1 & 2.

Thanks in advance, for the help!

Part 1 of 2
BID: RTDX0112

RTTY DX Notes for week ending 1st December 1989.

Conditions on the bands this past week have been rather odd. There was
very little around at the start of the week, but as the week progressed
conditions seemed to improve, and by the end of the week the bands were
fairly busy.

Saw someone the other day using the frequencies very efficiently.
A message from Canada to Hong Kong via packet radio had 19 lines of
addresses and one line of message, but then it had only been on the road
for eight days at that time. Gee, this packet stuff is very efficient!

Our thanks this week go to I5FLN, OD5NG, TG9VT, VE3JPC, VK2CS, VK2EG,
W1DA, W6/G0AZT, W0LHS and others. Again, thank you chaps.

QSL Information:

ZS8MI says that he will QSL via his home call of ZS6PT.

KD7P/AH4 cards go to Bob Winters, Box 8265 NCWP, Mou 3 Guam, Dededo,
Guam 96912-8265 U.S.A.

TJ1MW says to QSL via American Embassy Yaounde, Washington, DC
20521-2520. Or via American Embassy, B.P. 817 Yaounde, Cameroon.

UA1ZH QSL via Igor V. Titovka, Box 1982, 183071, Murmansk.USSR.

9L1CM will receive his cards via RT 1, Box 11A, East Burke, VT 05832 USA

UQ1GWW cards go to Box 418, Riga 226001 USSR.

Notes of Interest:

There was a slight typing error in last week's notes. N2HOS is QSL
manager for VU2SJV, not VU2SJ as stated. Sorry about that.

EA9JV has indicated that he will be going to 7X Algiers early next
year.

5Z4BH says that he has not been able to convince T5CT that amateur RTTY
is much better than commercial RTTY. J52US had the same attitude until
he tried the amateur bands.

YI0BIF is the special call for the Baghdad International Fair. Cards go
to the normal YI QSL address.

ZS8MI can often be found on SSB or CW and will go to RTTY upon request,
so Tom OD5NG says.
JD1AMA indicates that JA3EMU will operate in January from JD1 Ogasarawa.

It seems that there is some problem with the QSL path for the Hungarian
DXpedition to XW and 1S. The FDXF says not to send cards to Box 88F,
35170, Bruz.

Marquesas and Australs Islands have been refused admission to the DXCC
list.

From reports that I have received, there appear to be two groups
expecting to be operational from Bouvet Island. First there is the Club
Bouvet who expect to be operational by 23 December for some weeks, and
then there is the NCDXF who hope to be active in February. They are
entirely separate groups. Cards and donations for the Club Bouvet
should be sent to Club Bouvet, Box 88, N1361 Billingstradsletts, Norway.
We hope that both groups make it and that friendship will prevail.
GL DE DX1 (VK2SG) via TG9VT.

SB ALL @ ALLUSA $W6HJK1289
Soviet Ham Phrase Guide & Tape

BID: $W6HJK1289

RUSSIAN PHRASES FOR AMATEUR RADIO: UPDATE

This new 20-page digest compiled by W6HJK helps amateurs better communicate with their Soviet colleagues. A 90-minute audio cassette has been added to help with pronunciation. You need not be an expert in Russian, only interested in trying.

The book provides (1) English words and phrases for QSOs, accompanied by (2) Russian translation and (3) English transliteration, to assist you in pronouncing the Russian.

The guide follows the natural sequence of a QSO. Additional sections are on the Russian alphabet, phonetics, CW characters, numerals, and given names. Suggestions are made for addressing mail to the Soviet Union.

The author undertook this project out of a personal interest in improving the quality of his QSOs with Soviet hams and to enhance USA-USSR relations.

The original guide was given away, with the author asking minimal donations to cover the costs. Now that several thousand have been distributed, the cost is known and the following donations are requested. A nominal cost of $5 ($7 international) for the booklet, and $6 ($8 international) for the audio cassette, are requested to Beyond War Foundation, who financed the reproduction.

Requests should be sent to:

The current NJ Scanner law (written in 1936!) prohibits installation
of any receiving device capable of receiving government, police or
fire communications in any vehicle unless you're a government official
fireman, police officer or emergency squad member. (This is a paraphrase,
I have the full wording at home). You may have such a receiver if you
have a letter authorising such from the chief of police of your township
or county. Legislation changing this to just prohibiting the use of
a receiver to commit a crime or interfere with law enforcement is
currently in the respective committees of the Assembly and Senate.

As the law is written, most modern amateur VHF or UHF is technically
illegal as it can tune public safety bands. As a practical manner,
the law is rarely enforced unless you are doing something else illegal
at the same time.

Whether the law is actually enforceable to a court challenge is another
matter. The ARRL is considering asking the FCC to issue a position
on whether states have the right to regulate radio receivers or whether Federal pre-emption
rules.

Incidently, I have a letter from my chief of police so I'm "legal"!

KENDALLG@VTVM1.CC.VT.EDU ("Gary F. Kendall") writes:

>My dilemma is whether a Macintosh
>would *really* be worth the extra $$$ in comparison to an IBM-compatible
>system, especially in terms of available 'plug-in' hardware boards ...

This is a hard question. I have both a Macintosh (but not a Mac II) and a PC-clone, and there are advantages and disadvantages to both.

First, the only thing I use the Macintosh for (at all, nowadays) is with my PK232. The reason I do that is that it generates much less EMI* than the PC, so it interferes less with receiving RTTY (news & weather) communications. I also wrote a (rudimentary) program to interface to the Kenwood R-5000's serial port, and that was easier to do on the Macintosh because of the graphical user interface. Also, the Macintosh's linear address space (due to the 68000) is a lot nicer than the PC's segmented address space, if your're doing programming, although the resource manager in the Macintosh tends to put artificial restrictions on the sizes of objects that defeats this to a certain extent.

But aside from that, I prefer the PC. There is a lot more software for the PC (although it doesn't look as nice, it tends to do more). Also, a big advantage I find is that it is very easy to build boards for the PC because you can buy prototype boards that have all the necessary interface hardware on them at a very low cost from mail order places like JDR. I recently built a high-speed (telecommunications-grade) A/D converter for my PC, for example, to use in recording WEFAX transmissions. It's very easy to do on the PC because the PC's bus is so simple. (I'm talking about the old traditional PC bus in XTs, ATs, and most clones, not the new bus in PS/2s. I don't know anything about those, but they seem to be a good bit more complex.)

Also, the PC just costs a lot less, both at first and in the long run. I gave up upgrading my Macintosh because Apple kept requiring you to add new things to be able to run the latest software. This may not be the case any more, but I bought a Macintosh fairly early and had to upgrade the RAM (replacing the CPU board), then the ROMs, then the floppy disk, and now I would have to buy a whole new machine to be able to run the currently-popular software because I'm already at the maximum RAM size for this machine (512K) and a lot of software now requires 1M. Apple doesn't seem as sensitive to its established user base as IBM (this has its pros and cons, but when you buy a machine it helps to know it will be useful throughout its lifetime).

You can get parts to put together PC clones from mail order firms that let you "mix and match" parts, and replace parts with newer ones, without all this trouble. A lot of people seem not to like the PC because it is an IBM product, but, these clones have little to do with IBM other than following the de-facto standard in the PC, since IBM has for the most part moved on to the PS/2 line now and left the XT and AT to the clone manufacturers. (This is a generalization, but we're talking here about PCs for use with radio, not a history of IBM. :-)) If you build your own, be sure to buy from a mail-order firm that is fairly well-established and lets you return things if you don't like them (JDR is currently my favorite; DoKay used to be but they went out of business after many years).

One thing about the PC, if you choose it, is that you should definitely buy a VGA board for the graphics adapter, especially if you plan to receive weather (or press) facsimile. You can get (black & white) images that are close to TV-quality with a good VGA board (color is harder since there are a limited number of colors you can display at once, and it's more noticeable; but FAX is in black and white anyway). The VGA is a really well-designed graphics adapter. I use a monochrome PS/2 compatible monitor (very inexpensive) with mine, and thus the cost of the VGA wasn't that bad.

*On this subject of EMI, I've done a *lot* of work on the PC to shield it, and the emissions from it now are relatively minor, but still not as good as the Macintosh. Really I wish I could figure out some way to further improve the shielding on the PC in that regard, but that's another story. Has anyone ever seen a rating of various CPU boards for PC clones on how "clean" they are with regard to RF emissions? The emissions from the CPU board I have seem to come almost entirely from the RAM array. I'm not sure if it is unavoidable (the Macintosh has many fewer RAM chips than the PC, so that alone could make the difference) or if there is some way to further improve it.

Oh, no, did you have to say that?!? :-) For the money I'd rather buy a
PC Unix, but for use with radio, DOS is better since you can get it "out
of the way" when you need to do real-time programming. (Well, you can
mostly get it out of the way, if you're careful.)

From: jmseb@cbnewsd.ATT.COM
Message-ID: <3498@cbnewsd.ATT.COM>
Source record: 15156

I am contemplating the purchase of a new HF transceiver and I would
like the opinions of the net on *compact* transceivers such as the
IC-725, IC-735, TS-140, TS-440, etc. I am particularly interested
in receiver performance, general reliability, and service experiences.
The rig would be primarily used in my home station, but mobile use
is a possibility in the future. My home station use would include
DXing and a modest amount of contesting.

Please reply by email and I can summarize responses later if there is
interest. (We need to save newsgroup bandwidth for pizza wars,
military callsign debates, and amateur legal opinions :-) :-)).

I am looking for comments on the Sony ICF-SW1S general coverage receiver. I have a catalog from Communications Electronics that shows this unit complete with an external (active?) antenna, power supply, headphones and nifty carrying case for under $300.

Is this as good a deal as it appears to be? Please respond directly to me. I'll summarize if the response volume warrants it.

I (jump to the presumption) that the professor was Taylor Howard, founder
of Chapparal Communications and Professor of RadioScience at Stanford (he
also has an experiment flying on the Galileo spacecraft).

In fact, it was he who first approached HBO and offered to pay for the service.
HBO figured that, since satellite reception was SO difficult and SO expensive,
no one would want to do that -- so they refused to send him a bill.

I think HBO has changed its mind about this.

I recently got back into Ham Radio after about 35 years off the air. I dug out my old logbook (KN4DWW) and looked up a few of the guys I had worked in 1955 and sent one of my current QSL cards to them...just to see if they were still active or remembered "back then".

.

One Ham responded with a very nice letter recounting some of the old times, and enclosed a copy of my QSL to him that he had saved all these years. I had forgotten what my card looked like.

.

I still believe in QSL'ing. It is a nice gesture that all Hams should be prepared to undertake when they go after their licenses. I don't think it is fair to expect the "other Ham" to pay for your mail, or your cards. Remember, you ARE the "other Ham" to everybody else.

.

Bob,

The thing that concerns me is that your willing to quit ARRL due to what one "Section Level" volunteer official said. He probably shouldn't have used his title in the posting! I'm assuming that his section manager approved the posting, if not, then the fellow is operating on his own initiative. When any league appointee posts to a public forum (packet, or usenet as examples) we need to be VERY careful about what we say/do because it can easily be interpreted as League policy. I've chosen to put my own title on by the signature this time just to indicate that I would most likely have been informed in some manner about such a policy. Again let me emphasize volunteer apointee! Very little of your dues reaches the field organization that this fellow is a part of. We certainly get some finacial support from ARRL, but its mostly in the way of printed stationary or reimbursement for stamps and such. As an example, I think my section has a total budget of approximately $2000/year.

As far as I'm aware, there is no national directive for the Amateur auxilary to do anything about about this particular issue. (They would be the ones who would talk to the FCC on ARRL's behalf.) Besides, even if it were a concern, I have a lot larger fish to fry than worry about this. I have enough jammers, bootleggers, etc to deal with locally to keep me busy for an eon. I just haven't seen anything from ARRL nationally telling me to worry about this. (I wouldn't anyway)

Steve Wilson

KENDALLG@VTVM1.CC.VT.EDU ("Gary F. Kendall") writes:

>My dilemma is whether a Macintosh
>would *really* be worth the extra $$$ in comparison to an IBM-compatible
>system, especially in terms of available 'plug-in' hardware boards ...

(and someone else wrote a pretty good response.)

I have an old PC clone (Columbia Data Products, remember them?) and a Macintosh SE, a pretty recent purchase. I think the bottom line is that if you are comfortable with using DOS and function keys, and have no real problem with or objection to remembering the commands and key assignments, a PC will be much cheaper and much more flexible for you. Especially for ham radio use. There is a lot of good DOS ham software, and very little Mac ham SW (even less good Mac ham SW). In fact, if the addressing schemes on UUCP, USENET, etc. haven't yet driven you banannas, then you will probably save a lot of money sticking with DOS based PCs.

On the other hand, if you or someone else who is likely to be a regular user of the computer you purchase, are not technoids or will only be casual users, especially children, the extra $$ you pay for the Mac will be well worth it. I'm sure by now every one has heard enough about the interface, but it really is a lot easier to use. This becomes really apparent if you get used to a certain word processor at work (for instance, I'm using VMS TPU right now), and then occasionally use one at home. Relearning Word or Perfect writer on DOS each time is a bear (yeah, yeah, all you CRTL-ALT-DEL fanatics quickly get CTRL-Q-Z burned into your skull for repaginate, I know), while the Mac interface really does require you to remember very little.

If you want to encourage your kids to play on the computer (I think elementary schools ought to teach typing, not cursive), the Mac has a big advantage. As far as add on boards, I've found very little need for them on either the Mac or the PC. I added a multi function board to my PC, but the Mac already came with the ports, RAM, and clock.

What would I recommend? If you (the experienced UUCP/USENETer) are the only user, get a PC. You will save a lot of money, and find a lot of ham radio application SW around. If you grit your teeth everytime you type PESCATORE_JT@GTE.COM%LIPOSUCTION!JJHOME!EAT!AT_JOES then get a Macintosh. If your want to get non-computer-weenies to become computer users, get a Macintosh.

PS - RF wise, by using shielded RS232 cables, with only pins 2,3, and 7 connected, and by putting some chicken wire over the fan exhaust, I got rid off all my PC rf problems.

Get a noise bridge.

>>If an antenna is matched to the source, regardless of how it is matched,
>>all the energy sent down the transmission line is radiated (neglecting,
>>of course, losses in the line , tuner, traps, etc.).
>
>Is it the same for energy coming FROM the antenna?

If the antenna is matched to the feedline, there will be maximum power
transfer from the antenna to the feedline. If the feedline is matched
to the reciever, there will be maximum power transfer from the feedline
to the reciever.

>>You need to define what you mean by radiation efficiency. The fact is that
>>the radiation pattern will be different for a non-resonant antenna than for
>>a resonant one. But this may be desirable in certain situations.
>
>Is this also true for the antenna used for recieving? Somehow I suspect
>not ... The energy from the air has plenty of other places to go if
>the antenna isn't resonant ...

Under ALL circumstances, the recieve pattern for an antenna is the same
as the transmitting pattern for the same antenna at the same frequency
in the same environment. This means that you can measure the radiation
pattern either by tranmitting a signal and mapping it's strength, or by
moving a known signal source around an antenna and mapping it's
strength. (Sometimes it's easier to turn the antenna.)

>>If your antenna SWR is 2:1, your losing about 10% of the transmitted power back
>>to the transmitter load! This is power that is not radiated anywhere. Contrast
>>this to a non-resonant but matched antenna which will radiate 100% of the

>it? What gadget will tell me 'This antenna is resonant at 6005 Mhz.?)

A noise bridge. The antenna is resonant when it's impedance is R+j0
ohms.

>>Even if you tune the antenna exactly to resonance, it is unlikely that it will
>>be matched to the transmission line over any practical bandwidth. This again
>>introduces SWR and a reduction in maximum radiated power.

>
>How important is an antenna tuner to the SWL? (Hey, somebody has to
>listen to all you folks talking! :-))
>E. Michael Smith ems@apple.COM

With todays sensitive receivers, the loss of your feedline is probably
not all that important. Neither is ensuring that your antenna is
(as) perfectly (as possible) matched to the feedine, and likewise
ensuring that your feedline is (as) perfectly (as possible) matched to
your receiver. With current commercial equipment, I don't think that
these things become significantly important until the high VHF region.

In the rare case that original ideas Kenneth J. Hendrickson N8DGN

In response to the recent inquiry about receiver performance on selected HF rigs.

A local HAM who is a engineer, periodically has club members bring him their radios for testing.. Much of his testing is for performance in strong signal situations and multiple signal situations. I cannot elaborate on his test methods, nor how many radios of X-kind have been tested. I do, however, recall that the Icom IC-751A faired the best in THOSE areas of the last big batch of tests he did.
I can't tell you if that was with stock filters or what.. (One of those rigs had a fancy International Radio filter in it..) The guy who did the testing is K9IMM..

> Telecommunications Engineer II, RCOFD.
>
>
> If this is what the ARRL is doing with our dues money then
> the ARRL has just lost a member.

The ARRL has a lot of volunteer helpers who can do as they please without reference to ARRL. So this is probably not ARRL policy, just the views of an ASM. That being said, I agree with the views expressed. I don't care if you like it or not, modification for out of band service (MARS and CAP excepted) seems to be illegal. What gives hams the right to do this? What if everyone started carrying around non-type approved radios on police/fire/etc frequencies. What if CBers start modifying their radios to operate on 10m. Where do you draw the line.

On a related topic:
I'm not sure if the net needs yet another subgroup, but does anyone else think that a radio.scanners catagory would be a good idea?
It could contain:

Lists of frequencies for police/fast-food/railroads/....whatever
Mods to convert ham gear to out of band tx/rx
Discussions of who is allowed to receive what
Discussions of the merits of various scanners

In short, it could carry the non ham-radio material that this news group carries. Over the last week or so I calculate that >45% of the postings have belonged to such a sub-group and well over 50% of the total text. Perhaps we should rename this group?? The newly formed rec.radio.shortwave might be a better forum but the machine I read the news from does not yet seem to have access to it. Am I alone in thinking this stuff is out of place here? Even though the "CQ PIZZA" saga went on forever, at least it was about ham-radio. I'd even settle for a rec.ham-radio.tech, where I wouldn't have to wade through so much peripheral stuff to find a posting on ham-radio.

Bob Atkins, KA1GT

(NOTE: For those who might miss the point. This is not a real call for yet another newsgroup, but is intended to stimulate discussion on what should be posted to the ham-radio newsgroup).

4536. The un-net on 10meters on Saturday (1600-1800Z)

Newsgroup: rec.ham-radio
Date: 1989-12-05 23:21:12 UTC
From: rusty@cadnetix.COM
Message-ID: <10468@cadnetix.COM>
Source record: 15152

Well, I had a pretty good time last Saturday 'doing the un-net', as they say :-). I was a little late getting started (10 minutes or so), but finally made contact with N4XHX and N4CDO at about 1720Z (an hour and a half into the 'unnet' - and I had only made one previous 10m contact that morning, at 1630Z). Then I stumbled into a 10-10 'net' where I picked up 4 new 10-10 numbers. PRetty interesting, I've finally got to talk to the west coast!

Anyway, the reason for this posting is (1) to make those of you who have not tried to meet us on 10 on saturday envious enough to get you on the air :-), and (2) to bring up something I've been thinking about in relation to the un-net.

It seems to me that the 'upper' end of the novice segment of 10 is pretty overloaded when the DX starts up. I spent most of my time last saturday trying to find an open spot to call CQ. It seems to me that the 'lower' end is a bit less crowded (although I've not spent a LOT of time down there, it has seemed to me to be less busy when the upper area is packed).

So, the first question is: how about if we move the un-net down to 'somewhere between 28.305 and 28.315 (depending upon qrm)' ?

How many people think thats a bad idea? If I don't get much/any mail disliking this idea, then lets move on down...

Also, it seems that the conditions are good enough that we might find it better to move the time range from 1600Z through 1800Z to 1700Z through 1900Z so that we can involve more of the west coast stations. However, I'm not real sure yet how that will impact the east coast folks, so I'm asking for input. How do you like the idea of moving the time an hour later? (In practice, I've stayed on at least 2 hours, so I've decided to make the time range 2 hours. Hope nobody thinks I'm being paternalistic about the un-net, but since I did sort of start it off and I'm sort of the 'driving force', I've taken the liberty to propose changes to it. Anyone else who thinks of improvements, feel free to pipe up! :-))

So, if you would *stop* checking in to the 'un-net' (whatever it means to "check in to the unnet" :-)) because of either of these changes, I'd appreciate hearing from you! Also, the same goes for if these changes would make you *start* 'checking in'. In fact, if it would make it 'significantly' easier or harder, I'd appreciate hearing from you as well.

Thanks, and 73 de rusty n7ikq

4537. Aircraft callsigns, etc....

Newsgroup: rec.ham-radio
Date: 1989-12-05 23:34:42 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <8912060003.AA18919@ti.com>
Source record: 15153

I thought the discussion about this had long since degenerated to a more general discussion of whose political views take precedence; but since more flak has arisen, I'd like to make one more comment, then I'll shut up on the subject:

Those who are really interested in the who's and why's of the aircraft call-signs need only visit their nearest Air Force recruiting office. Sign on the dotted line. Then, you can not only learn all about it, but you can be a part of the action! Afterwards, you can ask curious civilians why they are interested in it: hopefully without flames.

Regards,
Dube Todd

4538. dual banders (2m & 70cm)

Newsgroup: rec.ham-radio
Date: 1989-12-05 23:41:09 UTC
From: david@mmsac.UUCP
Message-ID: <2831@cygnus.mmsac.UUCP>
Source record: 15154

Yesterday, my wife asked me what I wanted for Christmas. I told her I wanted a dual band radio for my car. Then she asked what model. All I could say was, "Uh... I remember a Kenwood... or was it Yeasu..."

So, I am looking for information about the various dual band mobile radios that are currently on the market. I would like to know the features and prices, but more importantly, what kind of good or bad experiences have you had.

Thanks.

NOTE: If you reply by mail, please use the path in my .sig, not in the header. My header always seems to get screwed up!

4539. Motorola HT-600 Modifications

Newsgroup: rec.ham-radio
Date: 1989-12-06 00:15:55 UTC
From: lawrence@smcnet.UUCP
Message-ID: <385@smcnet.UUCP>
Source record: 15159

Has anyone ever found out how to convert the 2 channel Motorola HT-600 or Radius P-200 radios (same radio) to the six channel model? At first I thought the onlydifference was a metal stopper that prevented the switch from selecting channels3 thru 6. When removed, the switch will move into those positions however the radio will still only TX and RX on channels 1 and 2. All of the leads from the switch appear to be connected to the CPU of the radio and I am able to program frequency and PL data into memory locations for channels 3-6. Is there anyone out there who knows if there is a jumper or diode or if it is burned into the CMOS EEPROM and needs to be changed with some other type of software to make this thing think that it has 6 channels instead of 2.

> I got the following off of a packet BBS the other day . . .
>
>> [deleted stuff about so-called illegal mods to ham gear and how]
>> [sysops should censor data on these mods.]
..... All supposedly attributed to:
>> Mike N6KZB @ N6KZB Orange Section ARRL ASM.
>> Telecommunications Engineer II, RCOFD.

Well!!! First off I should admit I don't know what an "Orange Section
ARRL ASM. Telecommunications Engineer II, RCOFD." is,
But..... whoever is promoting censorship of this data seems to be
misunderstanding the spirit of amateur radio:
$SOAPBOXMODE ON
There is no type approval for amateur gear, nor can there be.
The radio amateur as a condition of operating MUST make whatever design
decisions, measurements, and apparatus settings are necessary to ensure that
radiated signals meet technical specifications in such areas as RF power,
frequency, spectral purity, modulation mode, bandwidth and so on.
On the one hand he is free to construct or adapt any equipment whatever
to transmit his signal. On the other hand he is personally responsible
for the quality of that signal. To ensure the quality of the signal he
must necessarly make measurements with instruments, from time to time,
and to check those instruments against trusted sources (such as other
instruments or calibrated crystals or WWV transmissions or so on).
IMHO too many radio amateurs rely on oriental appliance manufacturers
to produce a transceiver which they TRUST to perform to spec. and then
fail to check whether their specimen does, in fact, generate legal
emissions. As a result manufacturers seem to be getting away with
restricting technical information in their efforts to frustrate the
efforts of pirates.
No reasonable person approves of radio piracy, (except perhaps in time
of war), but censorship is neither an effective nor a legitimate way to
fight piracy.
Radio amateurs have a legitimate need to receive AND to generate (but
NOT to radiate) out of band signals as part of propagation studies,
equipment design and test gear calibration.
$SOAPBOXMODE OFF
By all means vigorously persue pirates for their piracy, but _not_ for
exchanging technical information.

I'll give Mike N6KZB the benefit of the doubt, I suspect he has been
quoted out of context.

Oh, and to those concerned about such matters please accept an old
timer's apologies and read "he or she" for "he" in the above etc. etc.

Henry BLACK G4NOC/W6 (415) 857 6655 henryb@hpspd

/* ---------- "ARRL" ---------- */

>Several messages are circulating concerning how-to, or want-to, modify
>VHF or UHF amateur gear for out of band operation. Why anyone would be
>so blatant as to tell someone how, or request to violate the law is
>beyond apprehension.

While I realize that *many* such requests come from people who have
illegal operations in mind, there are several entirely legitimate
purposes that come to mind.

One legitimate reason for such a request is that the requestor plans
to modify a 2m rig to serve as the exciter for a tripler and amplifier
in the 70cm band. An unmodified 2m rig will operate between 144 and
148 MHz; running it through a tripler will give a 432-444 MHz
operation. As any ham over the rank of Novice is supposed to know,
the 70cm band extends from 420-450 MHz; a modification to a 2m rig to
give it the capability to transmit (into a dummy load, or the tripler)
between 140 and 150 MHz will extend the tripled output to cover the
entire 70cm band.

Another possibility is that the requestor plans to operate in a
country that has a different spectrum allocation in VHF/UHF than the
United States.

In any case, can you cite any law or regulation that is violated by
carrying such information on a BBS? Acting on the information is
another matter altogether -- but even then, it's perfectly legal for a
ham to *posess* equipment that can operate out of band -- the ham
simply isn't allowed to operate it in an illegal manner.

I know that I'm going to get flamed, now, for having posted excuses
that the illegal operators can use in order to contrive
legitimate-sounding requests for out-of-band modifications.

4542. Mac vs IBM

Newsgroup: rec.ham-radio
Date: 1989-12-06 01:42:51 UTC
From: k3mc@APPLE.COM
Message-ID: <8912060142.AA25869@apple.com>
Source record: 15165

Actually, you can have the best of both worlds by getting a Mac and running a program called SoftPC on it. SoftPC completely emulates an XT machine (in software!), down to the comm ports, v20 processor compatibility, etc. Currently, SoftPC v1.3 has a Norton SI rating of 5.5 on my IIci, which is quite respectable.

SoftPC only runs on Mac II, IIx, IIcx and IIci at this time, however, Insignia Solutions (the maker of SoftPC) promises support for the SE and Portable in a couple of months.

As for user interface, and the growing amount of innovative software becoming available, there is no choice: get a Mac!

Note, too, that even though I work for Apple in the Fremont Manufacturing section, I truly believe that the Mac is superior. I have programmed PCs for more than 5 years, and know them inside out; I've been hacking on Macs for only a couple of years, and the more I learn about Macs, the more I like 'em.

And, if you go to your local Mac dealer now, he'll let you carry a Mac system home with you *for free*! If you like it, you pay for it. If you don't, you return it between Jan 1 and Jan 15 (I think those are the correct dates in jan
January that it must be returned by...).

-Mike K3MC

p.s. These are my personal opinions!

Cast my vote for rec.ham-radio.tech. It seems that rec.ham-radio has
turned into (or has been):
rec.ham,swl,scanner-radio.barf.pizza.ecpa.airport.argue.forever
Enough is enough of these endless legal debates. But if we must beat
a subject to death on this net, how about at least picking a more
technical (read radio-electronic) topic. Pick one-

Voltage vs. current baluns.
Tube vs. solid state final PA's.
Why are random noise pulses called static?

- or make up your own.

I'll start with question of my own. On 10 meters, from my QTH in
central Ohio, I can only work stations that are about 2000 miles
or more away from me, west coast, Europe, SA, Japan, but no south
east US, New England, etc. I'm using a 2 wavelength dipole that's
one wavelength above ground. A friend suggested that if I lower the
antenna, I'll raise the radiation angle and skip in closer. Anyone
have any experience with this sort of thing? (I don't intend to
lower my antenna, but I might build another one near the ground
if this concept works.)

BTW, why IS random noise called static ??????

Actually, the message had a copy of the ending .signature message, which I also
deleted, as well as some of the header information (added by the mailer daemon)
but here is my reply message. I am also going to add some stuff for those on
the net (in case anyone is interested).
****
Sorry to tell you this, but it's not an OS-9 program. It runs on RSD on the
CoCo, and bypasses the disk system and writes directly to disk, thus requiring
a clean floppy to do it. The reason for this is because it saves a graphics
image directly to disk, and its so big that the disk can only hold 2!
It would be EASILY possible to modify the program and port it to OS-9 as far
as the file system is concerned, but the driver for reading the FAX from the
tape port (I did say that in my posting, is is hardware specific to the CoCo)
requires machine language because of the tight timing requirements. Because
OS-9 is a timesharing system, there may be a problem with this, as it will
screw up the clock and timing, as they both depend on the IRQ line from the
clock, and it must disable this line in order to retain the proper timing (all
serial/parallel conversion is handled by software here, just as in the bit-
banger port). Hope this helps with your decision. If you still want more

info, it would be easy for me to send you the program, as it is quite small.
Hope this helps again. 73's (best wishes),
****
For those on the net, the program is called WEFAX 105. It runs on any version
of Color Computer and runs on Disk Extended Color Basic (DECB), thus requiring
1 disk drive. It uses the built in tape recorder port to demodulate and
decode the signal, which can be supplied from anything. The main problem is
that you do not have any grey ranges, and you must be careful how high you set
the audio level on the radio (a friend of mine knows someone who blew out the
port by setting the audio too high). It works VERY nicely (hey, its FREE) for
what it will cost you (if you already own a CoCo and a radio to receive the
transmissions with, all you have to do is make (or, if the connector is right,
just buy) a cable to connect the port (its a 5 pin DIN female plug) and the
audio from the radio. My friend has used it and likes it alot. If anyone
wants it, I can send it to them through the mail system. I'm also thinking
of putting it on LISTSERV if enough people want it. That's all for now, 73's,

From: johan@guille.ece.orst.edu
Message-ID: <14248@orstcs.CS.ORST.EDU>
Source record: 15038

Hi
I have an 'old'(7 years) FT290R from Yeasu, that i bought when i was still living in Europe. It is a real nice trig, and has served for a lot of pleasure.
Being curious as I am, I fussed around with it for quit some time now.
Especially the four bits on the cpu that are programmable by hardwiring the pins on the chip are fun. I have been able to extend the range from the european 144-146 to 143.5 148.5 Mhz. Also i found a setting that covers roughly 142 - 149.3 Mhz , but the pll is very 'itchy', and the cpu only allows rx (tx only in 144-146 Mhz).
I have a few other mods from european magazines, and some stuff i did myself.
Is there anyone around that knows anything about this rig and has done mods to it ?
I would appreciate (any) new modifications !
(especially in the 1st IF , since it is too wide)

Anyway, any info about the FT290R is welcome !!

Please reply direct to me, and if wanted i'll summarize .

I agree with you completely, Bob. But I do not believe that this is a league policy. The league does some stupid things, but they have better ways to keep occupied than looking for things that are largely a problem OUTSIDE of the Amateur Service. Secondly, it occurs to me in ALL of the radio-comm services that the FCC does not respond to a problem that it does not see; if a member of a volunteer fire dept. uses a TH-215, well yeah it's illegal because of type certification, but I really doubt the FCC would care all that much. Finally, the tone of N2KZB's packet message does not sound like something the league would put out, both in the tone and the language. The November QST indicates that K6LKN is the Assistant Section Manager for the Orange Section, which suggests to me that if N2KZB is indeed the current ASM there, he's probably new at it.

I am not the soapbox-preaching type, but I think that rec.ham-radio is *VERY* out of control. The volume of traffic has gotten high while the content has degraded to petty bickering and text that has deviated unexcusably from the purpose of this newsgroup.

I would like to remind new users of the group that there are many, many pages of text with regard to network ettiquette. (A "new user" is defined as anybody who is not familiar with these procedures).

Let's try some 'passive resistance', please; think twice about posting. Is it about some aspect of HAM RADIO? Or did the article you are responding to remind you of what happened last time you were in Paris with your HT? The distinction that I am getting at is that this newsgroup is NOT the same as being on the air; when you are using a ham radio, you can talk about what you like. This newsgroup is for talking about ham radio. period.

> radios that are currently on the market. I would like to know the
> features and prices, but more importantly, what kind of good or bad
> experiences have you had.
>

I purchased a Yaesu FT470 about 2 months ago, and overall I am quite satisfied. One interesting feature is that you may monitor both 2m and 70cm at the same time. There is a 'mixer' control at the top which determines how much volume each band gets - in the middle its equal volume, all the way left its all UHF, all the way right and its VHF. This is a handy feature. It is also a pretty compact compared to the other units I looked at. The only real shocker I had when I entered the handi talkie world was that the little buggers are REALLY thirsty for the juice. (xlation: they draw a lot of current) I picked up the optional FNB-12 battery pack. Its 12v @ 500 mAh. This gives me a 5 watt output, but its really only useful for about 45 minutes. Thats if you talk for 3 mins, then listen for three, talk for three, etc. You really have to stick to low power as much as possible to get the most enjoyment out of it. One thing that helps is if you use an earphone for rcv. The difference in current draw for increasing volume levels is very surprising.

BEWARE: You are about to get pounced on royale about the infamous intermod problem of the 470. It's true. I get to hear the weather on most of my favorite repeaters. If you turn the squelch down it usually goes away, and you can also get rid of it by re-orientating the antenna for a moment. It's not as bad as people make it out to be. I live in Minneapolis, a major city. I know other users who are a little more rural, and they have no problem at all with it. Also, Yaesu will fix it for free if you send it to them. I haven't sent mine in yet, because its not that big of a deal. Supposedly the new ones out have this problem fixed. I would call Yaesu and ask them what serial numbers to look for, if this is true.

73's

SILVER SPRING, MD NOVEMBER 6, 1989
TO ALL RADIO AMATEURS BT

Ross Forbes (WB6GFJ), President of Project OSCAR, Home Sustains Severe Damage

Ross Forbes's (WB6GFJ) house sustained severe damage two weeks ago due to the San Francisco earthquake. Although Ross was not hurt nor were his parents hurt during the fifteen second long earthquake, since then Ross's entire efforts have been focused on getting his home repaired. As a consequence, Ross has asked the AMSAT News Service to inform satellite enthusiasts that during this difficult period that WB6GFJ is getting his home and UOSAT-11 Digital Communication Experiment (DCE) Gateway station repaired, HE WILL NOT BE ABLE TO ANSWER ANY INQUIRIES SENT TO PROJECT OSCAR. If you have written to Ross about information concerning satellite tracking programs or any other topic and are expecting a quick reply, please be advised that it may be many weeks before Ross can reply. Under more normal circumstances Ross has always been very prompt about returning replys to letters and inquiries. But with his house so severely damaged, Ross can't begin to think about anything else. So "please stand by" as WB6GFJ completes his QTH repairs.

AMSAT-NA SPACE SYMPOSIUM SUMMARY

HR AMSAT NEWS SERVICE BULLETIN 315.01 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 11, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA Space Symposium Held In Des Moines, IA Nov. 3-5th; A GREAT SUCCESS!

The Radio Amateur Satellite Corporation (AMSAT-NA) held its 1989 Space Symposium and Annual Meeting this past weekend, Nov. 3-5th, at the Meredith Corporation's facilities in Des Moines, IA. This facility provided an excellent meeting place for the hosting organization, the Central Iowa Technical Society (CITS), to sponsor this prestigious group of amateur radio's finest. Radio amateurs from all around the world -- Europe, Mexico, South America, New Zealand, and the Philippines -- traveled to Des Moines to be part of this remarkable event. Starting off the Symposium on Saturday morning was Jan King (W3GEY), Bob McGwier (N4HY), Tom Clark (W3IWI), Jon Bloom (KE3D), and Harold Price (NK6K). They presented a detailed run down of the MICROSAT program. NK6K gave an interesting review of digital-store-and-forward software which he, N4HY, and Jeff Ward (G0/K8KA) are developing. Following the PACSAT discussion, Stan Sjol (W0KP) and Bill Clapp of Weber State College (WSC) summarized the CCD camera experiment and the other scientific experiments which will fly aboard the WEBERSAT MICROSAT. Also included was a sample of a high resolution picture taken with the WSC CCD. Rounding out the morning session was Dick Jansson (WD4FAB) on the Phase IV geostationary satellite design effort. After reconvening from lunch, Courtney Duncan (N5BF), AMSAT-NA VP of Field User Projects, talked about the many exciting activities related to OSCAR-13, eg., Operations Nets, ZRO Tests, and the upcoming MICROSAT launch. Then came Antonio Franklin (N6NKF) and his discussion of his satellite tracking program known as InstantTrack 1.0. Even Bob McGwier (N4HY), the author of QuikTrak 4.0, was impressed! After Antonio came a series of papers about exciting scientific missions in which AMSAT and OSCAR satellite users are being invited to provide a major support role. These projects included the Solar Sail, Lunar Polar Orbiter, and NASA's Small Expendable-Tether satellite experiment. Following these papers came Jeff Wallach (N5ITU), Chairman of the Dallas Remote Imaging Group (DRIG), who presented an paper about high resolution WX satellite image processing. Showing slides of WX satellite pictures processed on his IBM-AT computer, many of the Symposium attendees were overwhelmed by the unbelieveable pictures that N5ITU's IBM-AT produced. And finishing the day with a lot of good natured humor was Bill Brown (WB8ELK) with his excellent presentation about ATV experiments with balloons. Bill showed a video tape of his latest high-altitude balloon experiments in which one of his balloons reached an altitude of 133,000 ft! Attendees were awestruck at the sight of seeing the curvature of the earth at 133,000 ft! Most interesting was the trip back to earth after the balloon burst and the impending impact!

After a "attitude re-adjustment," the Symposium attendees returned to the Meredith Corporation meeting facilites for the banquet and awards ceremonies. Over 50 awards were presented to AMSAT volunteers to recognize their service to the AMSAT organization, the MICROSAT program, and the furtherance of OSCAR satellite program.

For those who missed the AMSAT Space Symposium, in the next issue of AMSAT Journal, the proceedings of the Symposium will be included so that AMSAT-NA members can find out what went on. For a complete summary of the Board of Directors meetings held on Sunday and Monday, see ASR #192 which will be mailed December 1st.

JARRL "Turns Off" FUJI-OSCAR-12 Forever

The following announcement was made by JARRL last week:

November 1st, 1989 The Japanese Amateur Radio League

"Amateur satellite JAS-1/FUJI-OSCAR 12 has operated for 3 years. Power generation has, however, decreased with time, and at present, its average power generation is less than 3 watts, which is difficult to keep even at Mode D, the minimum power requirement.

Therefore, after deliberation, it has been decided that the operation of FO-12 should be terminated and ending time is scheduled for Nov 5th, 1989, until when a few operation of short duration will be available, if possible.

It is our great pleasure to realize that we were able to provide chances of satellite communication, especially, the flying BBS, and taking this opportunity, we thank all satellite enthusiasts for having connected with the bird.

Now, we are preparing the next bird JAS-1B, as the successor of FO-12, which has the same mission configuration as that of FO-12, except for its orbit. Please look forward to its launch in February 1990."

At the present time the AMSAT News Service (ANS) has no further details concerning this announcement. For those wishing to read more about JAS-1B, see the September issue of the ARRL's QEX magazine.

UoSAT Bulletin 203

**** UoSAT-OSCAR-11 BULLETIN - 203 3rd November 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** PLANS FOR UOSAT-D PCE **

This is a short report to keep potential users up to date concerning plans for the UoSAT-D PACSAT Communications Experiment (PCE).

The PCE will be an open-access amateur radio store-and-forward system. Although there will certainly be some gateway stations (since they are efficient and cost-effective), any correctly-equipped amateur station will be able to use the PCE.

A groundstation for the PCE must have a 9600 bit/sec FSK modem compatible with the G3RUH modem. This modem should be connected to a Mode-J satellite station: 145.975 MHz uplink and 435.070 MHz downlink. This modem and RF equipment must be connected to a packet TNC. Ground station antenna and RF power requirements should be modest; final satellite receiver sensitivity and antenna pattern measurements are now under way at UoS.

To access the PCE Packet Bulletin Board System (PBBS), you will need special software running on your groundstation computer. The PACSAT Groundstation Software will communicate with the PCE over your AX.25 TNC using high-level protocols currently under development by Jeff Ward (G0/K8KA) and Harold Price (NK6K). This system -- requiring you to connect your TNC to a host program and not just to a terminal emulator -- will provide a powerful electronic mail service eliminating many of the frustrations experienced by users of the existing ground-based PBBS network.

(The standard PACSAT protocols will also be implemented on the AMSAT-NA Microsats - although NOT using the 9600 bit/sec FSK modulation!)

Full details of the PACSAT protocols will be published as soon as they are available. A Broadcast Protocol specification (for transmission of bulletins, etc.) has already been published in the proceedings of DATASPACE '89. When published, the protocol specifications will allow software authors to begin implementing the PACSAT Ground Station Software for different computers. It is also likely that a PACSAT Ground Station Software implementation for IBM-PC compatible computers will be produced by UoSAT and AMSAT-NA and made available to other amateurs.

(de G0/K8KA @ GB3UP.UK.EU)

*** UoSAT-OSCAR-9 Reports ***

Thanks to all those who have sent in reports and telemetry from the last days of UO-9. So far the last telemetry received is from Dave Guimont, Jr. WB6LLO in San Diego, California who recorded telemetry at 05:15 UTC, about 2.5 hours before the satellite burned up.

Reports received from:-

JR3FRF, WB6LLO, Howard Day, Angus Newman, G3IOR, F1GRR, DL6DBN, HB9BEQ, ZL1TRE, Birger Lindholm, K9CIS (Richland Community College)

SILVER SPRING, MD NOVEMBER 11, 1989
TO ALL RADIO AMATEURS BT

AMSAT-DL To Commence Work On The New Phase III-D OSCAR

AMSAT-DL President Karl Meinzer (DJ4ZC) is pleased to announced that he has received a substantial funding for the AMSAT-DL Phase III-D satellite. This funding comes from the West German government and is provided for research in the area of satellite communications. Phase III-D, as outlined by Karl's paper presented at the 1988 AMSAT-UK Colloquium will depart quite radically from its predecessors -- it is designed to have an RF ouput of 250 watts! This new OSCAR satellite will weigh somewhere between 200 to 400 kg and will be placed in a high-altitude Molniya orbit, similar to OSCAR-13's orbit. AMSAT-NA congratulates Karl and AMSAT-DL on the start of a new OSCAR Satellite program.

AMSAT Short Bursts

For those wishing to obtain a copy of Antonio Franklin's (N6NKF) new satellite tracking program, InstantTrack 1.0, contact AMSAT-NA HQ's at (303) 589-6062 for more information.

OSCAR-13 OPERATING SCHEDULE

MODE B MA 060 to MA 160 NOTE: MODE S Operation will
MODE JL MA 160 to MA 195 return Nov. 23rd after
MODE B Beacon MA 195 to MA 200 the next AO-13 attitude
MODE B MA 200 to MA 240 re-adjustment.
OFF MA 240 to MA 060

AMSAT-NA is pleased to announce the availability of a new AO-13 PSK telemetry decoding program for the IBM-PC or compatibles that have a minimum of 256K RAM, a 360K disk-drive, a Serial port, and either a monochrome or color monitor. This new program was written by Jack Mathias (W9FMW) and runs in conjuction with the G3RUH 400 PSK modem. This menu driven program will decode every "page" of telemetry from AO-13. If you would like more information about obtaining this program, contact AMSAT-NA HQ's at (301) 589-6062.

Doug Loughmiller(KO5I), President of AMSAT-NA, wants to inform all AMSAT members that the new AMSAT BBS will now be part of the Dallas Remote Imaging Group's (DRIG) BBS at (214) 394-7438.

If you are building one of the TAPR or G3RUH 1200 Baud PSK modems so that you will be ready for the launch of the MICROSATs, a good way to "bench" test your modem is with a tape cassette which Jack Mathias (W9FMW) is offering. You can use this cassette to test out your modems without having to have a "live" signal. Also, you can be sure that the modem and the rest of your system is operating correctly before the launch of the MICROSATs early next year. So if you would like to find out more information about how to obtain the W9FMW TEST TAPE FOR TAPR/G3RUH MODEMS, contact AMSAT-NA HQ's at (301) 589-6062.

L de DB2OS & VK5AGR 02Nov89: ** AMSAT OSCAR-10 Status Report **

Please DO NOT USE the Mode B transponder on AO-10 until 20-Nov-89 since AO-10 does not have sufficient solar illumination to support the general use of the Mode-B transponder at this time. If stations will refrain from using the Mode-B transponder until that time, then the transponder can be made available for general use on 20-Nov-89 from MA 25 to MA 255. Once AO-13 operations begin on 20-NOV-89, DO NOT USE the Mode B transponder from MA 0 to MA 25 as AO-10 will be in eclipse during this period until 29-Nov-89.

MICROSAT LAUNCH DATE ADVANCES

HR AMSAT NEWS SERVICE BULLETIN 322.01 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 18, 1989
TO ALL RADIO AMATEURS BT

MICROSAT/UOSAT Launch Date Is ADVANCED!; Now Set For January 9, 1990

In what is considered a suprise announcement, Arianspace officials have informed AMSAT-NA and University of Surrey this week that the launch date of the MICROSATs and the UOSAT D/E satellites has been ADVANCED 10 DAYS! The launch date is now planned for January 9, 1990. This change in the launch date is the direct result of the postponement of the previous mission, designated by Arianespace as V35A, and was planned to lift-off on Dec. 13th. It appears that the problem with the V35A mission is caused by one of the primary payloads, known as "SUPERBIRD B," which is having technical problems and will not be ready for launch on Dec. 13th. So Arianespace officials have decided to use this extra time to prepare for the next ARIANE flight, known as the V36A mission; they feel feel that moving the MICROSAT/UOSAT launch date ahead ten days is feasible. Since the MICROSATs and UOSAT D & E, along with the primary payload SPOT-2, are ready to fly, the launch campaign will now begin on November 27th. That is the day in which the payload integration teams from AMSAT and the University of Surrey, along with their satellites, will arrive in Kourou, French Guyana. By Dec. 20th all of the payloads will be fully integrated aboard the ARIANE IV rocket and the teams will then return home on December 23rd. After a short Christmas break, the final AMSAT/UOSAT teams will then travel back to Kourou and will stay there and monitor their respective satellites until the launch on January 9th.

Since events are moving very quickly now, OSCAR satellite users should monitor the AMSAT HF/VHF Nets, OSCAR-13 Operations Nets, and watch the AMSAT News Service (ANS) bulletins for any further details concerning the launch of MICROSATs (PACSAT, DOVE, LUSAT, and WEBERSAT) and UOSAT D & E.

ARRL DXCC QSL INQUIRY

HR AMSAT NEWS SERVICE BULLETIN 322.03 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 18, 1989
TO ALL RADIO AMATEURS BT

An Inquiry About Satellite QSLs for DXCC From The DXCC Desk Of The ARRL

In an effort to insure that its policies concerning acceptance of Satellite QSL cards are reasonable and proper, the ARRL DXCC Desk is soliciting comments from AMSAT members concerning QSLing practices. Our current policy is to accept only those cards which explicitly state that the contact was made via satellite.

Our concern is whether or not our acceptance policy is in line with the QSL practices of satellite DXers. Basically, we are interested in learning what type of information individual operators include on their QSL cards. Comments should be brief, but please be sure to include the following: some indication of the amount of your satellite activity, what percentage of that is DX, and your QSLing habits. Those who have noticed variations in the format of cards they've received may include such observations in their comments.

The ARRL DXCC Desk appreciates your cooperation in this matter. 73!

L de DB2OS & VK5AGR 02Nov89: ** AMSAT OSCAR-10 Status Report **

Please DO NOT USE the Mode B transponder on AO-10 until 20-Nov-89 since AO-10 does not have sufficient solar illumination to support the general use of the Mode-B transponder at this time. If stations will refrain from using the Mode-B transponder until that time, then the transponder can be made available for general use on 20-Nov-89 from MA 25 to MA 255. Once AO-13 operations begin on 20-NOV-89, DO NOT USE the Mode B transponder from MA 0 to MA 25 as AO-10 will be in eclipse during this period until 29-Nov-89.

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" will be reactivated in late November following the mid-November reorientation of OSCAR-13. This activity is designed to be a test of operating skill and equipment performance. The following schedule of Mode "B" ZRO tests with a downlink frequency of 145.840 MHz was chosen for convenient operating times and favorable squint angles:

Saturday November 25, 1989 at 20:30 UTC
Saturday December 02, 1989 at 12:40 UTC
Saturday December 16, 1989 at 20:00 UTC
Saturday December 30, 1989 at 16:00 UTC
Saturday January 13, 1990 at 12:00 UTC
Saturday January 20, 1990 at 15:30 UTC

Any changes will be announced as soon as possible via the AMSAT HF/VHF Nets and OSCAR-13 Operations Nets. ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. of User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with one unit of postage. The brochure characterizes test procedures, means for obtaining certificates and gives some historical background about the program.

From: DLOUGHMILLER
To: AMSAT
CC: NCS, IS
Subj: ANS schedule change

Beginning this week the AMSAT News Service will observe a new production schedule. In the past several years the News Service has released material on Saturdays for dissemination through the following week. Beginning this week News Service releases will be made on Monday evenings US time for use through the following week. This change is being made in order to allow for additional input to the ANS to be made and for a more comprehensive review of ANS material to take place involving a small editorial review staff of key AMSAT managers. This is to insure that the material that is being published is as accurate and complete as possible.

Net control stations who will be handling net control activities during the weekend of November 25 and 26 should utilize ANS bulletins $ANS-322 and $ORBS-317 for these net sessions. The net set of news service material will be posted Monday November 27th.

We greatly appreciate everyone's support and cooperation as we make these changes to the distribution of AMSAT News Service material.

Subj: ANS material Delay

Well Boys,

I am afraid that I must report that a small glitch has caught up with us in our first effort to disseminate the ANS material in the new schedule.

The material will be posted about 12 hours later than announced over the weekend. The material will be posted no later than 16:00 UTC Tuesday in plenty of time for the Tuesday evening nets here in the US.

I apologize for the delay this time around. Please bear with us as we get our new mechanism working properly. I do believe that the improved service with the ANS bulletin material will be worth the trouble we've had getting it out this week.

MICROSAT - UOSAT LAUNCH CAMPAIGN TO BEGIN THIS WEEK

With the launch of six OSCAR satellites a little over one
month away, AMSAT-NA and the University of Surrey will be
dispatching the first teams of engineers and technicians to
the European Space Agency launch site in Kourou, French
Guiana beginning on Friday of this week. Other support personnel
including Jose Macho, LU7JCN of AMSAT Argentina and Dr.
Junior DeCastro, PY2BJO of AMSAT Brazil will be travelling to
the jungle launch site in support of their payload activities
as well. In all, a total of three separate teams of personnel
will be travelling to Kourou during the month of December on
behalf of AMSAT-NA and the Microsat project.

Activities related to the preparation of the six OSCAR
satellites for their trip to low earth orbit have been
accelerated over the past several weeks. During the
Thanksgiving weekend a small team including W3GEY, N4HY, WT0M,
Jeff Zerr and others worked on various software and hardware
issues at the AMSAT Boulder, Colorado lab. The team reports
that good progress was made on the AMSAT-NA PACSAT and the
AMSAT Argentina LUSAT packet store-and-forward spacecraft
as well as the BRAMSAT Digital Orbiting Voice Encoder
spacecraft, DOVE during the weekend session. Reports from the
University of Surrey indicate that last minute preparations
of the UOSAT D&E spacecraft are also progressing smoothly.

In addition to the Thanksgiving weekend activities,
earlier last week technicians at Weber State College in

Ogden, Utah performed final check out of the various experiments aboard the Webersat spacecraft. Bob Twiggs, Director of the Center for Aerospace Technology at Weber State reports that all experiments passed final checked out with flying colors. Webersat is the fourth Microsat in the constellation of birds to be launched in January.

The MICROSAT - UOSAT launch now scheduled for January 9th promises to be a truly exciting and momentous event. AMSAT-NA will be announcing the plans for real time coverage of the launch activity and for updated bulletin material during the first few days of life for the six new OSCARs. Stay tuned to the AMSAT HF and VHF Nets and to the AMSAT News Service Bulletins for the latest information surrounding the impending launch of the next generation of OSCAR satellites.

WB9ANQ APPOINTED AMSAT TECHNICAL COORDINATOR

HR AMSAT NEWS SERVICE BULLETIN 332.02 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 28, 1989
TO ALL RADIO AMATEURS BT

AMSAT Vice President for Operations, Courtney Duncan, N5BF, has appointed Bruce Rahn, WB9ANQ, Technical Coordinator for the Command Station Development Program. He replaces former Command Station Development Program administrator Ralph Wallio, W0RPK, who recently began a well deserved sabbatical from his many AMSAT duties. Bruce has been an active satellite user for several years and has been very active in the Command Station Development Program since its inception early in 1989, conducting technical projects and providing assistance to other team members. All correspondence from current members as well as new inquiries (SASE for information and application) should now be directed to Bruce Rahn, WB9ANQ, 410 Coronado Trail, Enon, Ohio, 45323.

Those already signed up will be hearing from WB9ANQ shortly about continuation and resumption of ongoing activities. For those who are interested in getting started but have not yet applied, program entry level membership has not been closed, nor will it be in the near future. Send an SASE with two units of postage to the address given above for more information and an application.

For further information, see upcoming issues of ASR or the AMSAT-NA Journal.

W8GUS APPOINTED 75 METER NET CONTROL STATION

HR AMSAT NEWS SERVICE BULLETIN 332.03 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 28, 1989
TO ALL RADIO AMATEURS BT

AMSAT Headquarters is pleased to announce the appointment of Ron Long, W8GUS as primary AMSAT 75 Meter East Coast Net control station. Ron will begin his duties in this capacity December 5th, 1989.

For the past year the net control duties for this net have been handled by K4EDU and W4BIW. With both of these stations being located in the deep south, coverage into certain parts of the coverage area of this net, particularly New England, has been spotty at best. AMSAT officials felt that it would be in the best interest of the East Coast Net to locate a primary net control station in a more central location to the region which is to be covered. W8GUS was sought out to serve in this capacity because of his centralized location, strong signal on 75 meters and his background both with the AMSAT organization and professionally having retired as a professor from Ohio State University. K4EDU will serve as back up to W8GUS in the future.

Please join in welcoming W8GUS to his new role by checking into the AMSAT 75 Meter East Coast Net on Tuesday evenings at 9pm EST on a frequency of 3.840 Mhz.

MICROSATS ARRIVE IN KOUROU

HR AMSAT NEWS SERVICE BULLETIN 339.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 5, 1989
TO ALL RADIO AMATEURS BT

MICROSAT LAUNCH CAMPAIGN COMMENCES

On Saturday, December 2nd, the four MICROSAT satellites (PACSAT, LUSAT, DOVE, and WEBERSAT) arrived in Kourou, French Guiana from Boulder, CO for the start of the MICROSAT launch campaign which began on Monday, December 4th. Accompanying the MICROSATs were AMSAT-NA Vice President of Engineering Jan King, W3GEY, Jeff Zerr, Jim Boschert and Chuck Stout. Dr. Junior DeCastro, PY2BJO from AMSAT Brazil and Jose Machao, LU7JCN from AMSAT Argentina joined the AMSAT-NA team members in Kourou over the weekend. Over the next two weeks each of the MICROSAT satellites will undergo final preparation and testing of all on-board sub-systems in readiness for launch. Most noteworthy in this process will be the loading of the computer software into each of the satellite's on-board computers. In support of this operation AMSAT-NA volunteer Harold Price, NK6K will be travelling to Kourou in the next week to lend his expertise in this critically important process. This phase of the launch campaign will come to culmination with the mating of the all six of the OSCAR satellites to the Ariane launch vehicle's ASAP structure, now scheduled to take place on December 15th.

The official MICROSAT-UOSAT launch date has now been set for January 11, 1990 at 01:35 UTC. An extensive AMSAT Launch Information Net Service (ALINS) effort is being planned by AMSAT officials so that it will be possible for radio amateurs world-wide to follow the progress of the six OSCAR satellites during the launch sequence. Specific details about the ALINS will be made available from AMSAT Headquarters in the next two weeks as final arrangements are made.

AMSAT-NA officials point out that assuming a nominal launch, general operations from the MICROSATs are not expected to commence until LATE FEBRUARY at the earliest. During the weeks following the launch, extensive engineering tests will be performed on all of the satellites. Also, refinement of the software which supports the various payloads including the digital store and forward function aboard PACSAT and

LUSAT, the digital voice encoding aboard DOVE and the CCD camera experiment aboard WEBERSAT will occur once the satellites are in orbit.

AMSAT-NA officials ask that users refrain from attempting to access the MICROSATs until an official announcement from AMSAT Headquarters is made indicating that they are open for general use. Attempts to connect to the satellites will be pointless until the software is finalized as the spacecraft simply will not respond to a connect request. Unnecessary activity on the uplink channels will simply complicate command station access to the spacecraft during the short duration passes, thus causing software preparation time to lengthen.

AMSAT CSDP VOLUNTEERS SOUGHT

HR AMSAT NEWS SERVICE BULLETIN 339.02 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 5, 1989
TO ALL RADIO AMATEURS BT

AMSAT CSDP VOLUNTEERS SOUGHT

With the up-coming launch of the four AMSAT MICROSATs, AMSAT-NA is looking for additional satellite enthusiasts who would be willing to volunteer their time to becoming part of the Command Station Development Program (CSDP). The CSDP is designed to train amateur satellite enthusiasts to become competent spacecraft controllers. The CSDP will help train volunteers in the techniques of telemetry collection and analysis for the purposes of determining the condition of a given spacecraft in orbit. There are various levels of participation for interested volunteers; the first level is basically to develop a proficiency of telemetry collection and analysis. The highest level of participation of a CSDP station is actually controlling one of the OSCAR satellites.

The entry requirements for a CSDP applicant is that the volunteer must be currently capable of operation on Mode A, B, or J. As the present group of AMSAT ground command stations (DB2OS, VK5AGR, ZL1AOX, KA9Q and G3RUH) can readily attest to, being a satellite controller requires a great deal of dedication and a lot of personal tenacity. So needless to say, these traits would be beneficial to anyone who contemplates participation in this activity.

If you would like more information about the CSDP and the various levels of participation, send a s.a.s.e. to Bruce Rahn (WB9ANQ), Technical Coordinator for the CSDP, 410 Coronado Trail, Enon, Ohio, 45323.

SA AMSAT INVITED TO PARTICIPATE IN UNIVERSITY SATELLITE

SA AMSAT has been invited to participate in a Satellite project being planned by the University of Stellenbosch for launch in the 1991/92 time frame. The University is situated near Cape Town and has recently expanded its activity by the establishment of a Bureau for Systems Engineering at its new Technopark near the main Campus.

The small satellite will include a transponder and several student scientific experiments. SA AMSAT President Hans van de Groenendaal ZS6AKV attended a meeting at the University on December 4 and 5 to discuss details of the project.

In addition, SA AMSAT is also studying proposals for participation in the AMSAT-DL Phase 3D project. Details of various propagation studies are being evaluated and will be used to formulate a proposal for an educational transponder. It is expected that SA AMSAT will submits its report and proposals to AMSAT-DL by mid December.

In article <7327@cbnewsm.ATT.COM> rma@mhgki.ATT.COM writes:
>... That being said, I agree with the views expressed. I don't care if
>you like it or not, modification for out of band service (MARS and CAP
>excepted) seems to be illegal. What gives hams the right to do this?

I don't mind saying that I've modified several of my Icom radios to provide out-of-band coverage.

When I got my IC-751A HF transceiver, I clipped the wire that enabled the transmitter in the general coverage mode. Why? It turns out that the computer interface doesn't allow you to change bands. However, the radio's firmware considers the 0.150 to 30 MHz "general coverage" mode to be a single band, distinct from the individual amateur bands. Therefore I could do exactly what I wanted by simply enabling the transmitter and always operating in general coverage mode.

In my IC-271A (2m all mode transceiver) I used a diode to simulate a press of a non-existent "band change" button to allow the transceiver to tune all the way from 140 to 150 MHz. Why? Because I wanted to listen to the MIR transmissions on 143.625 MHz, and this was outside the radio's original coverage range of 143.8 to 148.2 MHz.

On my IC-32A (2m/70cm handheld) I enabled all of the out-of-band receive and transmit mods. Why? Because that was the only way to gain the ability to transmit within the 70cm amateur band below 440 MHz.

So you see, Bob, there are some perfectly legitimate reasons an amateur might want to modify an amateur rig for extended frequency coverage that have absolutely nothing to do with a desire to operate illegally. Modifying an amateur transceiver to *enable* it to transmit out of band is perfectly legal as long as you don't *actually* transmit out of band.

4556. Satellite tracking program for UNIX

Newsgroup: rec.ham-radio
Date: 1989-12-06 07:53:15 UTC
From: elmquist@NIPS.SSESCO.COM
Message-ID: <8912060553.AA11643@nips.ssesco.com>
Source record: 15173

I saw a title for a message that mentioned satellite tracking software
and UNIX...but I never got the body of the posting. I'm guessing
someone was *looking* for said piece of software. I am too. Does
anything exist in source form that can be brought up under UNIX?
I have something called ORBIT23.C which came from SIMTEL-20..but
this piece does not calculate pointing angle (sometimes known
as squint angle) and appears to flake out when the AZ calculation
crosses from 2 digits to 3 (ie, from 99 to 100 degrees) or visa-versa
I haven't fully researched this phenomenon...but it left me wondering
about the accuracy of the calculations. Someone must be tracking
birds on a UNIX box... let's find out who-- Chris N0JCF

4557. rec.scanners

Newsgroup: rec.ham-radio
Date: 1989-12-06 11:47:41 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <8912061931.AA15466@ucbvax.Berkeley.EDU>
Source record: 15062

Bob, KA1GT, suggests that the voluminous scanner information currently occupying the net should be distributed elsewhere. I most firmly agree. This is rec.Ham radio, after all. Scanner fans have every right to air their views, discuss whatever they want to, distribute frequencies, etc. But if this net is for ham radio, that's what its postings should contain. I just don't have any interest in that topic, and I doubt that most of the amateur radio operator readers of the net have much interest in it, either.

This point was at the root of my "who cares?" mini-flame last week. It was amusing to see that all the responses in support came via direct e-mail whereas all but one of the hate-flames were posted globally. No doubt Bob's (and this) posting will generate the same fiery response from our scanner friends.

Go ahead, make my day.

4558. How old WE are....

Newsgroup: rec.ham-radio
Date: 1989-12-06 12:56:21 UTC
From: root@mjbtn.UUCP
Message-ID: <535@mjbtn.UUCP>
Source record: 15066
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

I got to thinking the other day about Ham Radio and the guys and gals here in rec.ham-radio.*. With all the talk (by supposed experts) that the majority of Ham's are getting older and that there are severe shortages in the newer generations of Americans coming into the hobby, I started pondering the question of just who WE are in terms of the age distribution.

Since many of the sites on Usenet are academic sites, one can quickly determine that there has to be a certain degree of young adults. But when you start to examine sites that represent companies, and sites that are public access in nature, it gets really hard to tell from that line of thinking. Also, the obvious know-how to operate computers and software is really no solid indication either since it seems that most Hams (young and older) are technical (to some degree) to begin with, and the computer has been mostly more a friend than an enemy. It appears that older Hams have adapted very well to using the computer.

Well, I pondered on it some more (not all at once :-)), and I decided to post this message here. What I would like to do, is to take a quick little survey. The 2 questions are VERY simple. You can just do a direct email reply. Here they are:

1) How old are you?

2) How many years have you been a Ham Radio Ooperator?

I have done no prior investigation on this; this is just some spur of the moment curiosity. What I would like to do is perform some simple (yet informative) statistics on the results I get back and post them back here to the group. I will keep all responses confidential, ie., no one will know who is what age, etc. :-)

I just thought it might be interesting to find out who WE are and to see if the rec.ham-radio.* naturally attracts younger people due to the nature of its underlying environment (the computer net). Some of you may not give a hoot. Well, that is fine. I will be taken up very little public bandwidth (I hope!). But it seems to me that it IS an important question since there are reports that do show (I don't have them here, but recall seeing it before somewhere) Hams as a whole are getting older. If this median we have here is condusive to bringing in today's generation, then we should recognize it as such. I am not attempting to do that now, just get an idea of where we fall.

Any and all reponses welcome! Please use direct email as net bandwidth can be used for better things.

Thanks for your cooperation!

73's,

Mark.

With regard to the above, *please* don't write to NOAA requesting information unless you are actually building a satellite ground station! NOAA NESDIS is not that well-funded, as you can tell if you've ever seen the diagrams/descriptions of their equipment, and it costs them a good bit to send out the literature. It's currently hard to get them to reply to requests for information (I have been waiting several months already to receive information on the TIROS DSB Beacon content), apparently because they just don't have that many people available to do that sort of thing.

The information provided in their literature is primarily information about how to calculate the orbits of the satellites, etc. A lot of it is out of date, since it tells how to manually calculate the orbits using maps and charts, whereas there is public-domain software available (such as ORBIT23 on SIMTEL20) which does all that for you automatically.

Much more useful information for getting started is found in the ARRL "Satellite Experimenter's Handbook," which tells how to build the required antennas, gives information on properties of the signal, etc., and in Larry Horn's "Communications Satellites" book from Grove Enterprises, which contains the same information as in the NOAA literature (and in more detail, for the most part). The Grove book also tells about the Soviet satellites, which aren't mentioned in the NOAA literature. The commercially-available (low-cost) packages people have mentioned, such as Elmer Schwittek's package, also contain this information. NOAA is currently very helpful with people building ground stations, but this is largely due to the efforts of Earl Popham, who was personally interested in helping radio amateurs, and who recently retired after many years with NOAA.

Regarding Jameco... I haven't had much good experience with them,
myself. I bought a CPU board (the JE1003) from them about 2 years ago
which was a *lot* of trouble -- it had (still has) timing problems that
they knew existed when they sold it, and after I found out it was having
trouble and wrote to them (thinking at the time that it was just a
faulty board), they wrote back saying that indeed they knew about the
problems, couldn't get the manufacturer to fix it, and didn't have any
documentation on the board. They then suggested that I buy a new board
they were getting ready to come out with! Having just spent nearly $400
on the faulty board, I wasn't too pleased with this suggestion.

About 6 months ago, I bought a prototype board from them, and again was
disappointed with its quality. The board itself is OK, but has no
solder masking or other higher-quality features, and did not come with a
back-panel mounting plate, so the board tends to wobble back and forth,
and had to have an RF shield constructed for it to cover up the opening
in the back of the chassis left by their omission of the mounting plate.
Subsequently I bought a JDR prototype board (about the same price), for
another project, and found it to be of *much* better quality. Jameco
has a lot of parts (ICs, primarily) that aren't available at many of the
other places, and are good for ordering that type of thing from, but
when it comes to PC subassemblies, they seem to not be very
quality-conscious.

JDR, on the other hand, is quite good, and their parts generally have
FCC-compliance labelling on them (though, as was mentioned, this in
itself is not very sufficient for use with radio). DoKay also used to
be very good, and unusually conscientious, but they were a very small
company and apparently went out of business about a year ago, since they
don't advertise any more and their phone has been disconnected.

[Disclaimer: I have no connection with any of these companies other than
my experience in buying from all three of them.]

From: jimv@hienergy.East.Sun.COM
Message-ID: <1186@east.East.Sun.COM>
Source record: 15053

Tried to mail, but bounced:

I have the ICOM IC-32AT, I like it alot, typical bullet-proof ICOM construction. Easy to mode for extended rcv in both vhf and uhf, also cross band rptr mod is easy. It's also the only one to put out 5 watts with the included (BP-70) battery. Only two negatives, it's on the heavy side (that BP-70 is fairly heavy) and you cannot listen to both vhf and uhf at the same time (no balance control). It will listen to one and monitor the other and switch based on the priority you set though. I hear the Yeasu FT470 has problems, I'd stay away. A friend bought the Kenwood TH-75 at the same time I got the ICOM and he seems happy with it, it's a lttle lighter, but only puts out 2.5 watts on high power. Either the ICOM or the Kenwood are good choices in my opinion. I'm sure there are some Yeasu owner's that will swear it's a good rig also :-), Caveat Emptor!

>Where do you draw the line.

I expect to be able to own radios that have the ability to xmit out of
the ham bands. I DO NOT expect to be able to xmit into anything other
than a dummy load. THIS is where you draw the line, at least in this
country.

My IC735 has the diodes clipped so that it xmits over the entire
range, and several times I have used it as a signal generator (at
various IF freqs) by running it into a dummy load with a loop of wire
antenna wrapped around the radio. (I know, I know, I should have a
dummy load with a tap on it). A Very Useful Device.

I consider my radios as signal generators, not just radios. Are you
going to tell me I can't own a signal generator? I'm glad YOU don't
run things.

From: charlie@oakhill.UUCP
Message-ID: <2702@radio.oakhill.UUCP>
Source record: 15055

Since there is a commercial meteor scatter system in place (monitoring snowfall?) it would be nice to tune in to the master station's beacon frequency and "listen" for meteors. What frequencies in the US are currently in use as the master station for meteor communication? Bob Parnass... is there any way you can look this up in your database? The name of the company was Meteor Communications Corp of Kent, Wash. I think.

Thanks in advance,
Charlie Thompson

>> Local ARRL jock opposes dissemination of "illegal" radio mod
>> information.

> KA9Q enumerates legitimate reasons for modifying radios.

I recently posted a mod for Icom IC-2GAT, and mentioned that a friend had verified it.

The young ham who modified his 2GAT got his license only 3 months ago, and it is his first rig. He was very apprehensive about opening the radio and soldering an extra diode among the tiny surface-mount components inside. His delight upon success was wonderful to see!

Graduation from appliance-operator to hacker is a significant rite of passage for any ham, no matter how simple the actual operation. Thus reinforced, he will advance to more complex hardware projects. The complexity of modern commercially-made ham gear can intimidate people from one of ham radio's major purposes and delights, experimentation. I'm glad that many modern rigs have simple ways to make profound modifications.

The NJ legislature only has about 3 more sessions scheduled before the end
of it's current term. On January 9th, all bills not yet enacted are flushed
out of the system, and would have to be re-introduced during the new term
to get them considered.

This is correct, it is the views of ONE PERSON. This person speaks with no
authority.

>That being said, I agree with the views expressed. I don't care if
>you like it or not, modification for out of band service (MARS and CAP
>excepted) seems to be illegal.

IT IS NOT ILLEGAL. Owning a piece of equipment that can transmit out of
band is not illegal. USING it to transmit out of band is illegal. Is owning a
old Police radio that I am going to convert for packet operation or to a
repeater illegal? Of course not....

> What gives hams the right to do this? What if
>everyone started carrying around non-type approved radios on police/fire/etc
>frequencies.

If I had a non-type approved radio that could transmit on police and fire
frequencies and a fireperson/police person wanted to use it to save a life,
I would hand it right over and deal with the legal problems later. I would
rather save a life than to worry about this petty issue.

>What if CBers start modifying their radios to operate on 10m.
>Where do you draw the line.

Use your common sense, if it will save a life then bending the rules does not
hurt anyone... CB folks did modify equipment about 12 years ago when the 23
channels got two crowded and as a result additional spectrum was allocated to
the CB service. It was the wrong way, and as I recall it was a big mess.

It is important to remember the following:

1) Ham radio operators in general do not want to loose their license due to
illegal operation, so they will not abuse the hobby and will be careful with
modified radios.

2) The number of Ham radio operators is SMALL when compaired to other services.

3) We are self policing (SP?). We do not tollerate illegal operation for very
long. We do not want the hobby to get a bad name.

4) As I understand the FCC rules, saving life is most important, keeping the
rules is seconary.

Now lets not get the FCC to make something illegal that is not a problem just because some of us are "AFRAID" of what "MIGHT" happen....

> a) I haven't found any reviews or discussions of the IC-726...anyone care
> to offer either?

The IC 726 is basically an IC 725 with the addition of 6 meter. There is a great difference between the 680 and the 726. I believe you will find that the 726 may have better receiver performance with very weak signals, and under high qrm conditions. This is due to Icom's DDS or Direct Digital Synthesis. The LO synthesizer is supposedly cleaner, ie. less noisy. This translates into less noise to cover up weak signals and better inter-modulation (IM) performance due to no reciprocal mixing.

> b) Both have rather wide AM selectivity. Are these useable SWL DX radios?

I have listened to both on the SW band. For typical listening they both do a good job. For jam-packed band conditions I have no data.

> I like the 726's receive sensitivity, and the 680's price...other than that,
> they both have various (to me) minor pros and cons, but the choice isn't
> clear-cut. Any advice would be appreciated.

If you can, find someone who has these radios and invite yourself over to their shack (bribe them with pizza if you have to). Spend a few hours with each and do the kind of operating that you plan on. A contest weekend would be a good receiver check. Remember to take into account any differences in station construction, or even better yet, see if you can convince one of the people to bring his/her radio to the other station for an A/B comparison. Other than that visit your local radio dealer and play. Good luck. Please tell us of your choice.

Good point phil, I tend to forget about operation outside the weak signal
parts of the band. There are indeed legitimate uses for tx equipment which
could transmit an out of band signal. I very much doubt that that is the
reason why most mods are made. As regards the previous posting about
reporting requests for such mods to the FCC, that is going a bit far. However
the op of a BBS has a perfect right to reject any posting he feels might be
inappropriate. If every modified HT was used to drive transverters to the
higher bands, then I for one would be very pleased.

Another legit use of modified radios would be a signal source for testing recievers, scanners, etc. Just be sure to use a dummy load on the transciever, or even an attenuator and cable connected to the reciever (use a LOT of attenuation!). But the dummy load will leak enough so that a nearby reciever should hear it. I'm sure that those RF signal generators I see around the lab are not restricted to FCC licensed people only! At least noone worrys about it here.

(What does FBOM mean?)

No flames from me! I support your postion entirely. I was rather
upset by the "ARRL" posting that you refer to.

There is absolutely nothing wrong with having the information about
how to modify your radio for out of band operation. Nor is there
anything wrong with performing these modifications to your radio.
What is wrong is using this modified radio to transmit out of your
licensed band.

If you are going to flame Kenny, you'd best flame me, too.

Subject: pizza, etc.
Newsgroups: rec.ham-radio
Keywords: fcc, arrl, sw, military, food joints, whatever

Dear members of the news group,

I wonder what happened to discussions about HAM RADIO? Now when I read the net, I read about ordering pizza by patch, jammer nets, shortwave radio equipment, monitoring fast food order desks, military communications, the (F)avorite (C)ha-(C)ha, on and on and on. Some of this stuff is good, most is BA-A-A-AD!!!!!!!! Can we get on to the more important stuff, such as equipment reports, construction hints, etc. and meet our official charter from the government to do what part 97.1 says. I won't quote it, because the NOVICE test had a question or two about it, and the EXTRAs arguing must have forgotten about it. Let's remember what HAM RADIO is about, and talk about the pleasureable side of radio, not politics, legal interpretations, etc. UNLESS absolutely NECESSARY!!

OK????????

I guess I'd like to see it (also) distributed elsewhere!
O.K. I fought for your right to agree or disagree as you choose. Enjoy!

>This is rec.Ham radio, after all. Scanner fans have every right to air their
>views, discuss whatever they want to, distribute frequencies, etc. But if this
>net is for ham radio, that's what its postings should contain.

In my humble opinion this IS the vast majority of what is posted.

> I just don't
>have any interest in that topic, and I doubt that most of the amateur radio
>operator readers of the net have much interest in it, either.

Ham radio and it's community of humans share MANY interests (even over the air)
and the hobby seems to support this diversity well. This net is a reflection
of the diverse sensitivities of the entire HAM community, and even "wannabe's".

I'm sorry you don't have any interest in (whatever) topic. But that does NOT
qualify you as the judge of what the rest of the entire ham community is
interested in. I don't want to believe you could be that egotistical!
So let me calmly assure you that I, a ham of 33 years, AM interested in ANY
radio phenomenon, frequency, mode, or use. Just so that you might be aware of
other amateur radio operators who do support the topic. I've seen your position
posted before, and answered before, DELETE the paragraph when you see it mingled
in with "real" ham radio topics.

Or use bandwidth to express your opinion, only don't seriously believe you are
a reflection of "most amateur radio operator readers..."

>This point was at the root of my "who cares?" mini-flame last week. It was
>amusing to see that all the responses in support came via direct e-mail whereas
>all but one of the hate-flames were posted globally. No doubt Bob's (and this)
>posting will generate the same fiery response from our scanner friends.

I hope that my posting is not interpreted as being on of "our scanner friends".
I don't own (or use) a scanner!

>Go ahead, make my day.

I believe it is a duty of mine as a world class ambassidor of radio, to do all I
can to "make your day". I sincerely hope I have, by re-setting your attitude!

> Voltage vs. current baluns.

Sounds good to me. Let's talk about baluns. I'm familiar with the
4:1 and 1:1 balanced-to-unbalanced baluns, but I have no idea what a
current balun is. Can someone explain what they are?

I use baluns with open wire feedline to get multi-band operation out
of an 80 meter dipole. I am aware of the large extremes of impedance
that I might see at the generator end of this feedline due to antenna
impedance on the various bands, and its transformation though some
distance of 450 ohm line, and I'm always looking for efficient ways
to match this impedance to the 50 ohm rig output. The best way seems
to be to use a link-coupled matching network with air-core inductors,
but these are very clumbsy to build and to get working over a good
range of HF bands. I generally end up using alligator clips to select
the tap positions on the coils. I've found that I can use a 4:1 balun
with a tee network on some bands,
but on others the balun is too lossy and heats up
when I put a KW though it. According to W2FMI's book on transmission
line transformers, these baluns are only broadband when they look into
an impedance that is close to intrinsic impedance of the bifilar windings
when viewed as a transmission line. I wonder if these current baluns
that I have heard reference to offer any improvement in efficiency over
a wide range of loads.

> see it?

Mike, there are two basic published resources on radio monitoring laws. Get both and you should be able to find the answer to almost any question about what's legal and what's not:

"Compilation of the Communications Act of 1934 and Related Provisions of Law," Committee Print 101-I, House Committee on Energy and Commerce (May 1989). $12 from the Superintendent of Documents, Government Printing Office, Washington, DC 20402. This contains the current version of the Comm Act of '34, which is NOT obsolete, just limited in scope by the ECPA. This volume also contains the ECPA, as well as laws dealing with satellite TV monitoring, copyright in broadcasting, the ban on cigarette ads, etc.

"ANARC Guide to US Monitoring Laws" Compiled by Frank Terranella (1989). This volume is more narrowly focused on laws that restrict radio monitoring. Now in its third printing, it includes most radio parts of the ECPA, the full texts of state scanner laws, plain-English interpretations and brief references to the relevant case law. Cost: $7.50 from ANARC Publications, 1218 Huntington Road, San Marcos, CA 92069 USA.

Charlie,

We do the same thing with TV channels, especially 12 and 13. We have a monitor which is tuned to the video carrier frequency of one of the non-local channels (i.e. you don't want to pick a channel that's close by, because you'll hear it all the time.) During meteor showers, you can hear the pings from the carriers of distant television stations. One of these channels we use is in the 215 MHz range, probably 13, since there is a channel 12 locally (Providence, RI).

4580. Re: What about for us SWL's ? Re: Tuning dipoles and antennas.

Newsgroup: rec.ham-radio
Date: 1989-12-06 22:08:47 UTC
From: alanb@hpnmdla.HP.COM
Message-ID: <1250092@hpnmdla.HP.COM>
Source record: 15031

Antennas are reciprocal -- that is the radiation pattern (directivity),
and efficiency are the same for receiving and transmitting. If, for
example, the transmitting antenna is down 6 dB in a certain direction
on a certain frequency (compared to a resonant dipole), then so will
be the antenna when used for receiving.

BUT. It turn out you don't care as much for a receiving antenna.
If you lose 6 dB from your transmitter, that's like transmitting only
1/4th the power. In a receiver, however, you are generally limited
by atmospheric noise. If the antenna is down 6 dB, BOTH the signal
AND the noise are reduced so that received signal-to-noise ratio
is the same.

Receivers do benefit from antenna directivity (reduction of interference),
but don't worry about efficiency or SWR (impedance matching), it almost
never makes any difference.

I am VERY worried about this type of thing.... Yes there are many valid
MARS/CAP reasons to modify Amateur radios for out of band transmit operation,
and I hope that all that do this have a MARS/CAP license and are ACTIVE in
the respective service.

But, MOST people these days think NOTHING of modifying a radio to transmit
out of the HAM bands... MOST do not know that it is illegal to do so for
use in the commercial bands... and don't realize that radios must be
type accepted for use in a particular service. MOST are modifying their
radios 'JUST IN CASE'.... Just in case of WHAT????

Some argue that the ham version of many radios are the same as the commercial versions, so that it is ok to modify for transmit... Technically this may be so, but LEGALLY it is NOT. Type accepted does not mean that if a radio has the same specs or has better specs than a type-accepted unit, then the non-type accepted radio is ok to use.

Why worry about this???? I am worried because I see it as a technological (SP?) advancement (synthisized (SP?) radios with wide band coverage) that will get legislated away from us when some yo-yo (probably not a licensed Amateur) gets a hold of one of these radios, and starts playing with the local police, fire, or ambulance services (yes, one of your modified radios COULD get stolen).

I can see the headlines now, "Ham radio equipment is used to disrupt police/fire/ambulance (choose one) communications and 5 lives were lost". What will they do??? Of course they will create a new law that says that broadband technologies and computer controlled PLL's cannot be used in Amateur gear any longer because it is too easlily modified for use in services where it does not belong. Can anyone remember why the cost of HF amplifiers went up, and why we can't buy production units that include 10 meters anymore??? They claimed that by not allowing manufacturers to sell amps that could be easliy modified for use on 11 meters (CB) would solve the problem of the illegal use of amplifiers in the CB service... Well, all I can see is that the cost of amp's went up to us hams, and we can't get a production unit that includes 10 meters, but the illegal use of amplifiers on the CB band has not stopped at all... Oh yes, I do understand that we can request a mod for most amps that we can perform to allow 10 meter operation on most units these days...

I sometimes wonder where this urge to modify radios to transmit in an area that we are not allowed comes from. Is it because we have many converts from the 11 meter (so called HFers) ops that had to modify their radios to get away from the CBers. This mentality that it is a good thing to do to a radio (modify it to expand its transmit range into illegal territory) may be ingrained. Don't get me wrong, I am not trying to put down the many good operators that we have gained from this pool of radio enthusiasts (SP?). Note that I do consider that there are separate breeds, one who is a CBer: one who operates a non-modified, legal 40 channel 5watt max, CB radio, and the other (self acclaimed 'HFers') who illegally operate on non-allocated frequencies with illegally modified radio equipment or with illegally used NON-TYPE ACCEPTED radios (usually Amateur radio gear).

So it is up to us licensed operators... If we continue to thoughtlessly (SP?) modify Amateur gear so that it can transmit on bands where we have no business transmitting, and that it is illegal to do so with modified amateur gear, EVEN IF THE USER HAS A COMMERCIAL LICENSE, because that gear is not type accepted for the particular service, then we should be prepared to pay the price when we get our hands slapped.

Why can't we be responsible enough to show that we CAN be technological leaders (SSB, PACKET, ...) and still show that we will not abuse the technology that we help to create???

So, go ahead, flame the ARRL for their action to protect the Amateur radio service from being attacked because of some non-thinking hams, or have them do nothing and wait for some legislative action that takes more priviledges away from us, and them blame them for not doing something about it.

Oh yes, I understand that MANY netters are into these mods... so I expect there will be many flames....

If you believe that it is proper to modify a piece of Amateur radio gear for use on frequencies that it is not designed and type accepted for (we won't even address the issue of having a license for the frequencies in question, we can assume that the user has said license), then lets start a non-emotional discussion pointing out the facts that I am NOT aware of... Yes, I have been wrong, many times in the past.

I also understand that my spelling is bad, luckily I didn't have to pass a spelling exam to get my Amateur license :-).

Flame suit on,

Rich

>

14313 is a war between those who feel that a group of people should not reserve a frequency for their sole use in the Amateur band, and those that think their cause is so great and important, that the frequency must be removed from all other Amateur activity. This forum has not even discussed that issue lately, so how can it be similar? Some people don't like to air their views, others can't wait. Some people, like the two above, read the views and form no opinion either pro or con. Rather than hit 'n', they leave no argument, but only garbage. They want a forum, but damn it, if they don't talk about what I want, you people are wasting the "bandwidth" and have only non-issues to talk about. Why not do us all a favor and unsubscribe? I'd rather see heated political discussions than listen to your shit.

Sincerely,
Steve Sampson, N5OWK, S.O.B., etc...

>Regarding Jameco...

My problem with Jameco is that their prices are way out of line compared to what I see at the local computer shows. I've bought several systems at these events over the past few years and, in general, I've had reasonably good luck. The one time I had an infant mortality (a Samsung VGA monitor) the dealer replaced it without any question (although I did have to drive it back.)

At the computer shows you also get the opportunity to examine things like cases before you buy to see if they can be made RF tight.

But you really have to do your homework before you buy parts for your clone system. I bought that Samsung monitor with the expectation that I could add extra memory to the VGA card I bought with it to display enhanced 640x480x256 images. The VGA card worked fine in the enhanced mode, but I discovered to my dismay that the (newly replaced) Samsung monitor couldn't support the slower scanning rate.

So at the next show I ended up trading it back in for a NEC Multisync 3D. It works great on Eric's weather satellite pictures (and everything else in the GIF collections, too.) But if I had done my homework ahead of time, however, I could have bought the Multisync at the beginning and saved myself some trouble.

From: brian@ucsd.Edu
Message-ID: <10338@ucsd.Edu>
Source record: 15042

I have modified my radios to work out-of-band because they make super-fantastic pieces of test equipment, both as receivers and as signal sources. I don't jam with them. What I **DO** do with them is work hard at trying to advance the state of the art of radio communication.

I really don't understand the little-old-grannies on this network who worry about what someone else might do with a modified radio. One gets the impression that these frightened little rabbits are so fearful that they hardly dare get on the air themselves! To justify their fears, they conjure up nightmare visions of "converted free-banders", "deaths from interference", and things that go bump in the night. Is it that they fear that others will show the same dearth of self-control that they lack?

If you are one of these people, I say to you, sell or give away your radios and take up stamp collecting. You clearly don't need ham radio, and ham radio doesn't need you.

Lead, follow, or get the hell out of the way.

TO whoever was looking for an H89 program: This is a CP/M machine,
right? I'd suggest looking through the bulletin boards for a copy of
PLINK. It's not the smartest thing, but it'll do a crude upload
and download, has few neat features, and best of all, it's small
enough to type into your machine (which may be necessary if you
don't *have* a terminal program already!) without wearing out your
fingers. At least, that's how I got started on my late, lamented
Northstar...

I had a Yaesu 4700rh dual band mobile. It worked ok. But it got stolen.
I now own a Kenwood 4100. It has good sides and bad sides. Bad stuff:

To change PL (an option on both radios) on the Kenwood, you have to hit
the menu button twice, dial to PL you want (it only goes UP, so if you
go past it, you have to go all the way around again - STUPID!), then
push the same button three more times. A pain when you are trying all
the PLs to "find" a repeater. On the Yaesu, it is a snap. You can even
change PLs while you are transmitting!

Good stuff: On the Kenwood, all you have to do to enable the cross-band
repeater function is add a jumper. The Yaesu doesn't offer it.

If I could buy any dual-band mobile, I'd get a Kenwood 721. It has the
cross-band built-in, and it operates much faster and better than on the
4100. It also allows you to monitor two bands at once. But I think it
goes for around $650-$700. Anyone have a current price on a 721?

From: garylee@yukon.scl.cwru.edu
Message-ID: <1989Dec7.045413.15392@usenet.ins.cwru.edu>
Source record: 15046

I recently purchased a used Bearcat model 205XLT and had a few questions about it that I hope others here may have answers for.

I use this scanner alot, but the nicad packs have a short (5 hour) life. The person I purchased it from had a modified battery case from ICOM (model BP-20) that he would use in case his rechargeable batteries went south. This is a great idea, but I use the scanner quite abit at home and wish to plug it in to an AC adapter.

I do realise that the nicad pack has a power jack on it, but it is also a charging jack. My concern is that it will mess up the battery (memories and all that) if I leave it plugged in all the time. Now, he also sold me a taper charger for the batteries. Can I safely use this to power the unit too?
^
by Metro West

I actually am looking for a battery type pack that has a separate power jack in addition to the charge jack (something like the Tandy models have). Can anyone confirm if the scanner only needs 9vdc to operate. If so, I could place a jack in the BP-20 to do what I want.

Any useful information will be appreciated.

Gary

It's in Africa, and it used to be called Upper Volta (was there ever a
Lower Volta?). It's one of the poorest countries in the world, and very
few of the natives have kilowatts and beams, so make the most of visits
by those from richer parts of the world. DK7PE was there in 8/89 as XT2CW.

You have to admit that ham radio is good for learning geography - perhaps
the FCC exams should include some! (no offence to the poster intended).

4592. How to charge my new battery pack

Newsgroup: rec.ham-radio
Date: 1989-12-07 06:29:58 UTC
From: storkus@arrakis.nevada.edu
Message-ID: <1102@unsvax.NEVADA.EDU>
Source record: 15057

I just bought me today an Icom CM-12 battery pack. It is one of those things where you insert your own batteries (I want to say alkaline battery holder, but that is NOT what I'm going to do with it). With 10 1.5V alkalines, it has 15V available, and just the same 12.5V when used with 1.25V NiCd's. Now my question (actually, now that I think of it, 2):
1. I am going to use it with NiCd's (hey, it's cheaper than a BP-7-about $20-$30 cheaper!!). It would be REAL NICE if I could charge the batteries WHILE THEY ARE STILL IN THE PACK. It has no recharge terminals of any kind. Any ideas on how I can hook something up on the top? And assuming I do, how much voltage and current (I have a 13.8V power supply that can generate up to 12 amps. What kind of regulation do I need?

2. (I just thought of this from an earlier problem) I wouldn't have bought this if I didn't need it. Coming back from Thanksgiving, the hook that held my old battery to the radio (on the battery, the little catch of metal) came off the battery when I banged it against my dad. It slipped off if bumped in the direction it slid off with any force. Yet, I (STUPID ME!!!!) chose to leave the battery attached to the radio. Sometime between coming off the plane and getting out of the taxi at my dorm, that battery came off the radio (I had it on my belt on it's belt clip; I have no case for it, but I'm working on that; it's been beaten around long enough, and it's showing). None of the lost+founds have been able to find it. So, today, got this. Problem: The hook metal on the battery won't come up high enough for the hook on the radio to catch, meaning THIS BATTERY WILL FALL OFF THE RADIO JUST LIKE THE LAST ONE!! I'm not willing to do that again.
Question: How can I raise the hook on the battery? Can I solder to it, and leave some sort of bead, or do I have to modify the radio's hook. My radio is no longer made anymore (it's a Santec (ENCOMM) ST-20T), and I discovered-long ago, much to my suprise-that Icom batteries fit it perfectly-except now I found out the hook won't catch. Any mechanical ideas out there?

3. I'm still waiting to see if anyone has any mods for that ST-20T or the Rat Shack's 10M HTX-100 xcvr. If you do, please contact me!

4. (Last one, I PROMISE): On the auto overvoltage problem solutions, how well will a rat shack SCR and a 15V, 1A zener on the trigger? Will it trigger too often with that low a trigger voltage? And to keep the SCR from blowing up, how about one of those rat shack's circuit breakers? I'm asking about all rat shack stuff because I can get it easy and I want to maybe do these mods during the holidays. The breaker I have trips to shorts in a fraction of a second (I needed it because the barrel plug I use for the handheld in the truck kept shorting out to the chassis; blew too many fuses; this blows fast enough to keep the fuses happy!).

Thanks in advance to any info you can give me. Note this change in my sig file
below. This will only be this long until I come back. PROMISE! So PLEASE
don't flame me! Thanks, and 73's,

Ah, yes. But first, they would have to convert every single radio and
base system to *digital*. That would be a considerable expense.

Rich:
I see your point...I worry about some hams who may not be responsible too,
it is a good instinct and you are to be commended for it. However, I cannot
imagine where you gather the facts you state about "MOST" hams and why they
modify their radios. I know at least 20 hams who have modified their rigs
to some extent and each and every one of them did it for the EXTRA RECEIVE
capability...and no other reason of which I am aware. If your claim is
indeed true, I am with you in my concern. It has just been my experience
that what you claim is not true. These hams had no choice to elect "recieve"
or "transmit" extensions, the mod accomplished both by design of the mfr.

>Some argue that the ham version of many radios are the same as the commercial
>versions, so that it is ok to modify for transmit... Technically this may
>be so, but LEGALLY it is NOT. Type accepted does not mean that if a

>the non-type accepted radio is ok to use.
>

Point well taken. I find that many hams are not aware of this, but I similarly have found only one (of the many I know and talk to) who suggested such a use for his radio. To take this one step further, just to know that your own radio is capable (and knowing the mod) of certain extended frequencies may just save a life at some point. I live here in S. CaL. and we may see the "big one" some day. I am sure glad I know about several easy mods to my radio which may allow its use for police/redcross, etc. in case of REAL EMERGENCY and disaster. So knowledge of such mods may be a real bonus someday.

>Why worry about this???? I am worried because I see it as a technological (SP?)

I don't see this point as a serious one, for the simple reason that police radios (and fire, etc.) are stolen every day and the problem is manageable. I do believe you see a valid problem that should be noted, and no one wants to interfere with public service radios....but I can't see this as a major contribution to the problem (we should just outlaw guns because they can be stolen and easily converted to illegal uses?)

>I sometimes wonder where this urge to modify radios to transmit in an area
>that we are not allowed comes from. Is it because we have many converts from

This is NOT the POINT, sir. Like I have found (unless you can convince me otherwise), the mods are basically to RECEIVE outside the ham frequencies and the radios DO NOT ALLOW for mods for just extended receive in the desired range.....

>So it is up to us licensed operators... If we continue to thoughtlessly (SP?)
>modify Amateur gear so that it can transmit on bands where we have no
>business transmitting, and that it is illegal to do so with modified amateur
>gear, EVEN IF THE USER HAS A COMMERCIAL LICENSE, because that gear is not
>type accepted for the particular service, then we should be prepared to pay
>the price when we get our hands slapped.

Absolutely true, but since your premises are quite flawed, I believe that such consequences are not going to flow from the widespread mods of gear.

>Why can't we be responsible enough to show that we CAN be technological
>leaders (SSB, PACKET, ...) and still show that we will not abuse the
>technology that we help to create???

KI believe that this is what the vast majority of hams already do, and do not need "big brother" helping us out on. Most of us are intelligent and caring enough to already know and act accordingly.

>start a non-emotional discussion pointing out the facts that I am NOT
>aware of... Yes, I have been wrong, many times in the past.

Hopefully I have put a few thoughts out for you?

>I also understand that my spelling is bad, luckily I didn't have to pass
>a spelling exam to get my Amateur license :-).

Far be it for ME to criticize you for such a thing! I just use a spell
checker (my wife says I cheat!)
>
> Flame suit on,
>.........
Nice touch.

4595. 2 meter or 220 MHz

Newsgroup: rec.ham-radio
Date: 1989-12-07 08:09:37 UTC
From: lawrence@smcnet.UUCP
Message-ID: <396@smcnet.UUCP>
Source record: 15060

Well I finally got around to passing the code and am waiting for the good ol' FCC to send me the Novice license. I am definetly going to go for the Tech. class license ASAP. My question is what type of rig should I start my HAM life with. I have narowed my choices down to either a dual bander 2 meter/ 440MHz ora 220MHz handheld. Does anyone have any coments or suggestions on what band they like the best. I hear that 2 meter is very popular but is also very
crowded in the urban areas. (where I will be setting up shop) Any replys wouldbe greatly appreciated.

4596. Mobile overvoltage protection.

>was created was to get away from just this attitude (I know it's just a few
>hams, but it certainly doesn't make me want to learn code any time soon...)

There's an implication that hams for some reason can't be or aren't
swl's or scanner fans. I'm sure we both know this isn't true. The
rec.radio.shortwave group has only just started up so it will take a
while for all the receive-only people to find it and start using it to
try and get away from the armchair lawyers and Yellow-bellied Bandwidth
Wasters. I'm sure the latter will feel compelled to follow just to keep
everyone else in line.

I don't really care where the postings happen, I read both groups, but
now that a receive-only group exists, it would be more elegant to post
swl/scanner information there.

As for learning the code and getting a license... it's something you do
for yourself. You can't try and devolve the responsibility onto others.
If you ever make the effort, I'd be glad to chat it up with you on the
bands.

Q 1: what is the ARRL mcimail account address? [in internet terms please]

A 2: I know compuserve 77777,444 has internet address 77777.444@compuserve.com
[per communication with WB2TEV]

Q 3: Does the commodore communication QTERM have an internet address?

Q 4: Does the sears/ibm service PRODIGY have an internet address?

Any information would be appreciated. 73, Bradshaw

>
>I got the following off of a packet BBS the other day
>and thought the net might like to comment.
>
>[mindless threats by a disturbed individual regarding radio mods]
>
>If this is what the ARRL is doing with our dues money then
>the ARRL has just lost a member.

The following is from the December 1989 "Moved and Seconded" section of
QST:

"9.1 The Executive Committee reviewed a report prepared by the Field
Services Manager documenting the actions of a Section Manager which had
resulted in numerous complaints from members. On motion of Mr.
Mendelson, the President was directed to write to the Section Manager
advising him that the expressing of personal opinions in the guise of
official ARRL communications cannot be tollerated, in part because such
conduct might jepordize the agreement between ARRL and FCC estabilshing
the Amateur Auxiliary; and that a repetition of this conduct will be
grounds for immediate removal from office."

Wadda you think? Sound like it might be connected?

By the way -- the league is its members. It does what its membership
wants. Every person who leaves the league because they disagree with
some group (code .vs. no-code, radio-mod idiots, etc.) is actively
supporting the other side. The way to change things is to stay and
fight. Changes are made by do-ers, not whiners.

Anybody out there in net-land know where I can acquire
the full X.25 and AX.25 packet protocols?

Thanks in advance - Mike

4602. Novice v2.2 and Advanced v1.2 fixes for HyperCard Stacks

Newsgroup: rec.ham-radio
Date: 1989-12-07 14:55:46 UTC
From: dls@genrad.com
Message-ID: <29660@genrad.UUCP>
Source record: 14945

Since the corrections for these two updates were minor, I figured I'd
post the corrections here. Other fixes available may be obtained from
me via email and include:
Novice v2.0 to v2.1 corrections
Technician v2.0 to v2.1 corrections
General v1.0 to v1.1 corrections
Advanced v1.0 to v1.1 corrections

These fixes are for the HyperCard Ham Stacks which I created for the
MacIntosh computer. HyperCard only runs on Macs, so I don't believe this
is of any value to IBM PC owners.

PS Note the callsign change in my .signature :-)

Novice Ham Stack v2.1 CHANGES to get to v2.2:

Someone has noted to me that the question on double-throw switches is
incorrect. I've looked at the Tune In The World With Ham Radio and I
DID copy it in correctly. BUT I agree that it is incorrect. So here's
the changes to fix it. This change DOES require "painting" ability in
HyperCard, but I will try to explain it so even an uninitiated can fix
it.

1. Ctrl M to pull up a message box.
2. Type "set userlevel to 5"
3. Type "show menubar"
4. Type "go to card "#275""
5. Click on the Tools Menu and PULL it over to the right side by holding
down the mouse and pulling OFF of the menu. When you release the mouse,
the Tools Menu will remain visible.
6. Choose the "select" tool. That's the dashed square right below the Browse
ICON in the top left corner.
7. Carefully select to top right circle of the picture in Answer B. This is
done by moving cursor just above the top left of the circle, click and
hold down the mouse while pulling across to the bottom right of the circle.
Keep the box as SMALL as possible but be sure that you've selected all
of the circle. (If you make a mistake, remember that Edit Menu, Undo,
will undo the last thing you did)
8. While the circle is selected, hold down the OPTION and SHIFT keys and
click on the circle and hold down the mouse key. Go STRAIGHT UP and place
the newly created circle right above the top slanted bar.
9. Release the buttons. Now, while the new circle is still selected,
hold down the OPTION and SHIFT keys and click on the circle and hold down
the mouse key. Go STRAIGHT DOWN and place the newly created circle right
above the lower slanted bar. The result should something like:

o
/ /
/ /
o|o o|o
| instead of: |
|o |
|/ |/
/ /
o o o o
10. Click Browse (top left ICON) in the Tools Menu, then click the Tools Menu close square.

Update complete! Now get out of HyperCard, select the Novice Ham Stack ICON, pull down File Menu and choose Info, and change v2.1 to v2.2.

Advanced Ham Stack v1.1 CHANGES to get to v1.2:

Card Bug Description
Name Type

#181 typo Question: "13.6" should be "3.6"
Answer D: "21.1" should be "16.5"

Update complete! Now get out of HyperCard, select the Advanced Ham Stack ICON, pull down File Menu and choose Info, and change v1.1 to v1.2.

If they ask me to I will, considering that I am willing to do my part in
fighting drugs. It would seem that pissing in a bottle is a small part to
play in this war when you consider that many others are losing more than
just piss, they are losing their lives.

I know this is out of line with this news group but then again so was
the posting I responded to, so I didn't start it.

>> their cellular radios.
>Ah, yes. But first, they would have to convert every single radio and
>base system to *digital*. That would be a considerable expense.

Not true. They could use an A/D to get the signal into digital form,
encode it with whatever digital encryption scheme they like, and then
use a D/A to get the encrypted signal back into analog. This signal
could be used to modulate the transmitter in the conventional way.
Alternatively, the digital signal could be used to directly modulate the
transmitter. (This is possible with PLL controlled FM tranmitters, for
example.) Of course, a D/A would still be needed to drive the audio
amplifier with the decrypted signal on receive. The expense is not as
much as you might imagine, but it still was significant enough that the
cellular-telephone lobby was able to spend thousands of dollars lobbying
for the nazi-gestapo-like ECPA law.

Source record: 14929

As was mentioned on the net, modification of the "NJ Scanner Law" is unlikely in this term of the legislature. Therefore we have to live with the old (1936) one for a bit longer. Here's the text of the old law.

2A:127-4. Installing short wave radios operative on frequencies assigned for governmental uses; exceptions. Any person who installs or has in any automobile, a short-wave radio receiver operative on frequencies assigned by the Federal Communications Commission for fire, police, municipal or other governmental uses, is guilty of a misdemeanor, unless a permit threfor has first been obtained from the chief of the county police, or the chief of the police of the municipality, wherein such person resides.
This section does not apply to any fire, police or other governmaental official of the State or of any county or municipality thereof.
The term fire official, as used in this act, shall include all active members and officers of any municipal fire department or force or any first aid and emergency or volunteer ambulance or rescue squad whether said department, force or squad be paid, part-paoid, or volunteer.

I asked my brother, who is an assistant prosecutor for Bergen County, to interpret what this law really means. Here is my summary of his comments. (Incidently, he has prosecuted people using this law).

1. The law is one of the few misdemeanors left in NJ from the old criminal code. Most of what the public calls misdemeanors are really disorderly persons offenses (DO). A DO can be brought by a municipal prosecutor; misdemeanors and felonies are brought by the county and are indictable offenses.

Therefore prosecution under this law usually requires indictment by a grand jury. As a result, this law is normally used only when a prosecutor is already going to a grand jury for a concurrent felony, e.g. roberry, etc. In addition, he calls this law "plea fodder"; a charge the prosecutor will give up if you a cop a plea to the underlying crime. Since most courts are so backed up, the chances of you being arrested, indicted, convicted and going to jail for this offense only are virtually nil.

2. Permission from your local chief of police is good for any frequency anywhere in the state. This is the same procedure as for firearm permits which are issued by your local chief of police as well and need not be obtained from each municipality which you visit. The permit is for the radio, not the frequency.

3. The fact that police frequencies are VHF & UHF and not "shortwave" is irrelevant. The intent of the law is to prevent you from listening from police or fire frequencies and going to an incident and getting in the way.

4. Technically, carrying a scanner in your trunk home from Radio Shack is illegal. But once again, that wasn't the intent of the legislature in passing the law and wouldn't go to court. (There weren't scanners in 1936).

5. He feels that the law might be overturned if it ever was appealled through the three levels of the state court system to a Federal court. Got $100,000 and a prosecutor with nothing better to do in order to test this ?

I don't want to beat a dead horse, but thought you'd like a prosecutor's opinion on the subject. (There are lots of other obsolete laws on the books as well. Don't tie your horse so the reins go across the sidewalk!)

That's interesting because a set of four phased verticals
actually located over shallow salt water at that same Puget Sound
location for Field Day in 1974 did not appear to have any particularly
spectacular performance. They got out OK, but probably not better than
a 2 element beam would have. Ask Rush if he remembers that setup.

IMHO, these topics are being discussed only for the first time, now that a significant number of hams have an unedited forum. Letters to the editor of QST (or any other rag) are woefully underrepresented.

Ham radio is a aged phenomenon in transition. I find relief in the discovery that some hams value it so highly that they will speak up about the stupidity inflicted upon (and by) hams.

We hams have got to unlearn a lot of the stuffy Harvard-Yale bullcrap promoted by the Newington Cabal about the "brotherhood of amateur radio" and being reminded to "avoid discussion of controversial issues on the radio". The fact is, the ARRL permitted controversy only when they were able to frame the issues.

Telecommunications has become increasingly politicized, to the extent that today hams must be acquire an activist mentality in order to simply remain hams. We can't go back to the good-old-days when Uncle Hiram and the FCC slept together and made everything OK.

here here! I never joined in the first place.

Besides, there is nothing illegal at all about modifying your HT to transmit out of band. It is illegal to USE that modification except in distress or for services that do not require type acceptance, like MARS, but the illegality is in the use of the modification, not in making it.

Think about a parallel situation -- My HF rig breaks. Whenever you use it on 40 meters, it puts a big spike right in the middle of channel 3. The FCC tells me about it. I have two choices. I can fix it, or I can stop using 40 meters. EITHER SOLUTION IS EQUALLY VALID AND LEGAL (presuming, of course, that the other bands are clean).

Let's take the same situation in the land mobile service. If a multiband transceiver has trouble on one band, there is no choice. You must fix it. The difference? Type acceptance. A land-mobile rig that puts out a spike is not acceptable, so you cannot use it at all.

Modifying my HT for out-of-band transmission is exactly the same situation as the first example. If I operate it in a certain fashion, it's illegal. If I avoid doing that, there is no illegality.

As hams, we have lots of other things to get peeved about than this, don't we? Sheesh!

gd@milkfs.itstd.sri.com.UUCP (Greg DesBrisay AA6BO) asks:

>> Where is Burkina Faso?

and oo7@astro.as.utexas.edu (Derek Wills, AA5BT, G3NMX) comments:

>> You have to admit that ham radio is good for learning geography -

I picked up a couple of books that I keep on the shelf next to the
Callbook and other references.

One is a "Merriam Webster Geographical Dictionary" which provides all
kinds of maps, geographical, political, and economic detail about more
places than I could ever run across on the air. I originally saw one in
the public library and when one appeared at a local mall bookstore, I
bought it.

Another is the "World Information Almanac" published by [don't laugh, now!]
the Central Intelligence Agency. It is available through the US Government
Printing Office Bookstores (you can mail order from them). It has information
about the political and social structure of the various places, and includes
the number of radio stations, how many airports, strange info like that. It
does *not* have the extreme detail in cities, counties, and geographical
entities (like rivers, mountains, named canyons, etc.) that the "MWGD" has,
but it does have some interesting facts.

...

At Dayton I noticed someone selling little atlases. At the time they seemed
high priced, but now that I have shopped around, maybe they weren't so bad.

Does anyone have one, with a "review" of its usefulness?

....

Here's one I *haven't been able to find:
M-V Island!

Where is it?
(Specifically! I know in general where it is!)

Jim Reisert, AD1C, commented on the use of distant TV stations as meteor scatter beacons. They also make great indicators of propagation conditions. With the lack of a national VHF/UHF/Microwave beacon system (such as is established in the UK) distant TV stations can be used to judge tropo propagation. I find that here in the N.NJ area, channel 12 (Wilmington, DL) is a great indicator of conditions on 144 MHz. UHF stations on Long Island make good propagation indicators for 432 MHz. It helps to have a reasonable TV antenna (mine is from RS) and a rotor. You need a fairly distant and weak signal (very snowy but discernable picture) to judge propagation conditions since one the signal rises above a certain level, no improvement in picture is seen as signal strength further increases. (FM threshold effect?).

>

Well, rich, It's a bit hard to keep emotion in check when one reads such
a collection of bovine effluvia but I'll try. Rarely have I seen such
ignorance of the law and common sense coupled together with acute
chicken little syndrome.

Your post and logic shows an ignorance of:

1) The law as regards Amateur Service.
2) The law as regards Public Service/Commercial service.
3) Reality.
4) Common sense.

Let's look at these in sequence. First the law regarding the Amateur Service.
I guess I can understand how a novice ham (regardless of license class) could
assume that there MUST be some law about removing the covers and messing with
the FM* inside. After all, the factory must be infinitely more capable of
designing and building radios than could be any one ham. And in today's
Orweillian NewThink, anything that's not OK'd by the government must be
illegal. Not to mention that is ought to be illegal to have fun.

On the other hand, those of us who have been hams since before the
WundorRiceboxes find this concept a bit strange. Especially those of us
who actually BUILD from scratch radios. Tell me sir, under your assumption
that it must somehow be illegal to MODIFY radios to go out of band, how
would the law handle my homemade radios? Since they were designed
from the beginning to make power and to receive wherever the VCO would
stay locked, how could this possibly be legal? The answer to this
question is left as an exercise for the student. Clue: It has something
to do with our charter.

Next, commercial and Public service. The law specifically permits the
use of ANY communications mode to mitigate a life-threatening situation.
I'll let you find the paragraph; it's been posted here before. Maybe
while you're looking, you'll read some of the other interesting paragraphs.
That means I can use any radio on any frequency if sufficient danger

exists. What is sufficient danger? I think each ham has to determine that himself and be prepared to defend his actions. Certainly dialing over to the local police dispatch frequency to report a car wreck is inappropriate and could not be defended. On the other hand, if I come up on a car wreck and find a victim bleeding or perhaps with a broken neck, and I cannot find a ham repeater with patch, you bet yer ass I'm going to get on the police frequency call out a unit. Anyone who would not should be prosecuted for negligence in my book. I'll gladly take any heat forthcomming after the fact. I'd bet the bank on there not being any.

Yes, I modify my radios (or build them from scratch) to work adjacent commercial/public service bands "just in case" for the exact same reason I have emergency power - Just in case. I consider it at least reckless to have the ability to mitigate an emergency and not do so.

Next, Reality. The reality is that modern amateur HTs meet or exceed commercial specifications. The reason is simple. With few exceptions, the amateur and commercial radios are the same with only firmware changes. So if a ham accidently (or on purpose) transmits on a commercial frequency, the sun won't quit shining and the gods of EMI will not smite the radio from his hand. He will be breaking an anachronistic law regarding type acceptance.

Speaking of type acceptance, I marvel at the hams that speak in ignorant awe of "Type Acceptance" as if it were some rite of passage a vendor must put a radio through. All this is, boys and girls, is the process of submitting a radio to some standardized tests the results of which indicate that there is a high probability that production units will also meet. This is an anachronism that should go the same way as the 1st class commercial. Back in the days when analog FM* really did go on under the covers and when it was state-of-the-art to make a crystal capable of 0.025% stability over the temperature range, it made sense to require extensive type acceptance testing AND to certify those wizards who were permitted to lift the covers on the FM*.

Now that FM* is contained within LSI chips and crystals capable of 0.001% stability are commodities, licensing the wizards makes no sense and neither does type acceptance. Half of the problem is already resolved.

So if I were to transmit on a commercial frequency, I know that my radio is at least as good as the one on the other end. I don't do this because I try to live within the rules but it's no felony if I do.

Lastly, is common sense. This posting really addresses common sense, a commodity sadly lacking in today's hams. And this is typically coupled with an almost mantical desire to tend to others' business.

Perhaps you should consider some other uses for radios modified for out of band service. These include

1. driving transverters.
2. Generating test signals.

3. Listening to test signals from other radios.
4. Monitoring public service frequencies as a public oversight function.

Lastly, assume for the moment that what I've said is not true and that transmitting out of band is truely evil. If, as you said, the possibility of an evil modified radio falling into bad hands is such a problem, why has this problem not become significant? Or even a problem? Maybe it's not such a problem after all.

[... excellent points from Mike deleted ...]
>As for user interface, and the growing amount of innovative software
>becoming available, there is no choice: get a Mac!

I cannot keep quiet on this. I'm no great lover of MS-DOS or of
its command interpreter, but there is a bad side to the "Wonderful Mac
Mac User Interface" that everyone ignores: it promotes the "Push Button
Mentality". This is bad.

The Mac's menus let you get up to speed really quick, but you
cannot get away from them. Sure, most applications give you keyboard
shortcuts, but they're not guaranteed and never cover everything.

The opposite extreme is the various command shells for UNIX.
New users have a real problem with things like case sensitivity and
terse command names. But an experienced UNIX user can (presuming they
have learned to type) whip out what needs to be done in a flash.
(and without dragging their arm across the desk)

The "right way" is a balance between the two. The only company
that has really gone all-out on marrying Xerox-looking windows (yes,
Xerox invented them, not Apple) and UNIX (the "programmer friendly"
OS) is NeXT. Sales of their cube have been less than exciting, but
the design is RIGHT: it has all the pretties, but built on a much more
sound foundation. (yeah ... you can get a NeXT to crash easy enough,
but that's not legitimately blamed on Mach) It's real live UNIX with
shells, pipes, standard I/O, unified file system; but all the apps
are menus and windows.

[sigh] But most of us cannot afford a "real computer" and must
settle for a Mac or PC or C64 or TRS-80 or Timex-Sinclair.

>p.s. These are my personal opinions!

Likewise.

The reason you can't work close-in stations on 10 meters is that they are in the "skip zone".

Have you ever noticed that when you look straight down into a pool of water you can see the bottom, but when you crouch down and look nearly parallel to the water surface, it looks like a mirror? The ionosphere acts the same way to radio waves -- signals that propagate stright up go right on through into outer space, while signals radiated at a lower angle can be reflected.

If you think about it, closer stations require a higher radiation angle. Theoretically, to work someone a block away via the ionosphere, you have to transmit almost straight up. Actually ground wave (non-ionosphere) works for very short distances (tens of miles), but distances from, say, 100 to perhaps 1000 or 2000 miles are in the skip zone.

On lower frequencies, the ionosphere is a better reflector so the skip zone is smaller or non-existent.

I don't know why impulse noise is called static!

I would expect a ferrite bead at one or both ends of the cord to supress
the RF from getting out of the wire and into the electronics... if the
wire has a modular plug it should be easy to tread it through a bead and
glue the bead to the {handset, phone body} if it works...

Study of Frequency Allocation System Launched
By JAY ARNOLD
Associated Press Writer
WASHINGTON (AP) _ The Commerce Department began a study Thursday that could lead to an overhaul of an aging radio frequency allocation system under siege from cellular telephones, pagers and muscular new technologies such as high-definition television.
The National Telecommunications and Information Administration, part of the Commerce Department, invited public comment on the use and management of the radio frequency spectrum as a first step towards a study it said ``will establish the spectrum policy foundations that will lead the United States into the 21st century.''
The study will be the first major examination of the radio spectrum since the late 1960s.
The study will address the regulatory process, allocations, alternatives for apportioning spectrum, spectrum conservation and new technologies and forecasting future spectrum requirements.
New technologies promise more efficient use of the airwaves by sharing frequencies without causing interference. But federal regulators are hampered by the current system, which awards blocks of space to categories of users regardless of how much or how little those blocks ultimately are used.
The head of the Commerce Department agency, Janice Obuchowski, said changing technology, ``coupled with explosive growth in demand, makes spectrum reform more necessary today, and potentially more feasible, than it has been in past years.''
There is an increasing demand for airspace to accommodate more cellular telephones and new communications devices that are being developed, such as wrist-sized pagers and automobile tracking equipment.
High-definition television, if it is to become a reality in the next decade, will need more of the frequency spectrum. UHF television stations may end up sharing some of their airwaves with these new technologies.
The government has been criticized for not using its own frequency allocations efficiently, and the House is considering a bill by Rep. John Dingell, D-Mich., that would require the government to relinquish frequencies for private use.
The Commerce Department agency said its study will examine possible changes in the current spectrum allocation system, increased sharing of airwaves between government and private users and whether some users may be able to switch to new delivery systems such as fiber optic cable.

Radio systems with fixed transmitters and receivers could be linked by fiber, which has vastly greater capacity and needs less long-distance amplification in comparision with copper wire or coaxial cables.
Obuchowski acknowleged that it would be difficult to persuade existing users to give way to others and said the agency's recommendations, if adopted by the Federal Communications Commission, would not mean ``radical'' changes in spectrum allocation that could make obsolete billions of dollars worth of radio and television equipment.
She said she favored auctions of spectrum for new commercial licenses or leases, in much the same way the government leases public land for grazing or oil exploration.
Obuchowski said she hopes to have the study completed next year.

Stop, stop, stop saying that it is illegal for me to modify my radio to transmit out of band unless you can show me that it is illegal to simply own a transmitter capable of doing so. Even though pushing the PTT may be illegal, I'm not illegal until I do it. It's like owning a car capable of going 100 mph. There are a few, rare examples where using this capability would be legal. Also true with my modified radio. There are a few, rare examples where using this capability (not necessarily on the air, mind you) are legal.

Please pick your terms right and don't tell me I broke the law because I modified my radio.

> have any experience with this sort of thing? (I don't intend to
> lower my antenna, but I might build another one near the ground
> if this concept works.)

I think that your experience has a lot more to do with propagation
on 10 meters than with the height of you antenna. I've used antennas
that are much higher than 1 wavelength on 10m, and haven't had any
trouble working stuff closer than 2000 miles when conditions permitted.
If you lower your antenna, you will just lose more power in heating
up the ground beneath it.

I usually get a lot more enjoyment from reading all the fluff and furor on the various newsgroups. The latest rage over privacy and the public airways is an entertaining break from real work, but I just have to add in my 5 cents worth concerning the "right" to receive, demodulate, etc., along with some thoughts about the power of government.

I actually pulled out my Encylopedia Brittanica last night and reread the U.S. Constitution. Did you know that it provides, among other things, a specific provision that the Federal Government shall have only those rights and powers specifically designated, and that all others are "reserved to the several states or to the people."? It also notes that laws and regulations of states may NOT supercede those of the Federal Government, which makes scanner laws and the like at least suspect, if not marginally unconstitutional. But I digress.

My real point here is that the original Communications Act of 1934 provided all the protection that cellular phones, HBO, etc. really needed. To those who claim the right to receive anything transmitted through their individual space, you are absolutely correct! Receive all you want (at least under the old law). However, should you choose to use information overheard on the public airways, including HBO movies, you step over the line. THE RIGHT TO RECEIVE DOES NOT CONFER THE RIGHT TO USE. If you overhear a conversation about an upcoming stock market deal, then go buy or sell based on that information, you have violated the inside trader law, because the information was not generally available to the public. If you buy a decoder, learn to decipher, and watch HBO, you could be prosecuted for theft of services, since you took specific steps to use the information you overheard.

I fully agree that the EPCA is an outstanding example of bad (and stupid) lawmaking. But the U.S. has always has the attitude that "there oughta be a law!", and Congress and state legislatures, anxious to justify their existence, are more than willing to provide one. What scares me is that some of these new laws, EPCA included, tread dangerously upon privacy rights by making possession of scanners, radios, etc., that might be used for violations illegal, even though purchase is legitimate.

Until individual citizens are willing to make public statements to their representatives, however, and do so rationally, the nation of laws that we generally agree is the best of a mediocre lot will continue to favor the special interest over its citizenry. My advice? Do like I do - write to your congressman and senators. You'll almost always get a reply, even if they don't agree with your position.

/ hpnjld:rec.ham-radio / root@mjbtn.UUCP (Mark J. Bailey) / 7:56 am Dec 6, 1989 /
I got to thinking the other day about Ham Radio and the guys and gals here in rec.ham-radio.*. With all the talk (by supposed experts) that the majority of Ham's are getting older and that there are severe shortages in the newer generations of Americans coming into the hobby, I started pondering the question of just who WE are in terms of the age distribution.

Since many of the sites on Usenet are academic sites, one can quickly determine that there has to be a certain degree of young adults. But when you start to examine sites that represent companies, and sites that are public access in nature, it gets really hard to tell from that line of thinking. Also, the obvious know-how to operate computers and software is really no solid indication either since it seems that most Hams (young and older) are technical (to some degree) to begin with, and the computer has been mostly more a friend than an enemy. It appears that older Hams have adapted very well to using the computer.

Well, I pondered on it some more (not all at once :-)), and I decided to post this message here. What I would like to do, is to take a quick little survey. The 2 questions are VERY simple. You can just do a direct email reply. Here they are:

1) How old are you?

2) How many years have you been a Ham Radio Ooperator?

I have done no prior investigation on this; this is just some spur of the moment curiosity. What I would like to do is perform some simple (yet informative) statistics on the results I get back and post them back here to the group. I will keep all responses confidential, ie., no one will know who is what age, etc. :-)

I just thought it might be interesting to find out who WE are and to see if the rec.ham-radio.* naturally attracts younger people due to the nature of its underlying environment (the computer net). Some of you may not give a hoot. Well, that is fine. I will be taken up very little public bandwidth (I hope!). But it seems to me that it IS an important question since there are reports that do show (I don't have them here, but recall seeing it before somewhere) Hams as a whole are getting older. If this median we have here is condusive to bringing in today's generation, then we should recognize it as such. I am not attempting to do that now, just get an idea of where we fall.

Any and all reponses welcome! Please use direct email as net bandwidth can be used for better things.

Thanks for your cooperation!

73's,

Mark.

If your neighbor's phone picks up your ham radio, then it may be as well
to remind the person concerned about the aspects of privacy law that he
might be infringing if HE listens to YOUR conversation!
(OK so if his phone picks up your sideband, it will not demodulate
to 'understandable' audio, but the principle is the same).
Here in the UK, any pickup of ham RF by a 'non-radio' device (phone, hifi,
hearing-aid, i've even heard of pickup on electric organs!) is by definition
the fault of the device being interfered with, and is the responsibility
of the owner of the device to solve. (Thats not to say that a well-mannered
ham will not provide assistance, just to be neighborly).

>
>73's de WB9MVP/6

I sent a reply to the original poster, but thought I'd quickly share my
experiences with the net. I've successfully treated telephone RFI in my
cheapie phones, and two types of Western Electric phones. I've also treated
RFI on my and a neighbor's answering machines using this method with additions.

I use a standard filter that I saw in a Tab book on interference who's
title and author escapes me. He suggested a 680 uH choke in the tip and ring
lines terminated with a 0.01 uF capacitor, like this:

```
680 uH
---------mmm-----|-- tip
|
= 0.01 uF
|
---------mmm-----|-- ring
680 uH
```

1 mH chokes would work, but all the ones I could find were too big to
fit inside the phone. The capacitor should be rated for *at least* 100 V and
150 would be better. I've used 100 V monoblock capacitors and they haven't
quit yet, but I'm told that the ring signal is 90 V RMS, so I'm pushing my luck.

I place one filter in the phone body where the line enters the
instrument, one on the handset cord where it leaves the body and one on the
handset cord where it enters the handset. I also place a 0.01 uF capacitor
across the earpiece element (speaker) and one across the mouthpiece, which
consists of electret elements in most modern phones. This technique has not
yet failed to eleminate RFI or at least reduce it to the point that it is
not a problem. I suppose two filters could be placed in series in severe

cases, but I've never tried it.

On old-style dial phones, I've treated the problem with just 0.01 uF
capcitors across the earpiece and mouthpiece elements. Nothing more was needed,
but I was ready to put one of these filters in if that didn't work. My
answering machine has one of the above filters built in where the telephone
line enters, which solved most of the problem. The final solution was to
wrap the power cord coming out of the wall transformer around a ferrite bar.
I close-wound the cord over the length of the bar. Now the machine never
acts up. A neighbor about 120 feet away just wrapped the power cord around
a ferrite bar and has had no problems since. I utilize power levels of about
850 W from 160 m through 20 m. My amp will crank out only 500 - 600 W
on 15, 12 and 10 m.

As an ARRL Asst. Tech. Coord., I've advised other hams to try this and
it has always seemed to work. I've also been with FCC engineers investigating
RFI complaints and the FCC takes the approach that "We don't protect telephone
equipment," which translates to "We don't address RFI problems to telephone
instruments. It's your problem that you have phones suseptable to RFI."
I don't know of any RFI standards that phones are supposed to meet and
manufacturers are uniformly worthless when it comes to addressing the problem.
Looks like this one will be with us for the forseeable future...

73 and Merry Christmas!

I don't think a single ferrite bead will do the job, Mike, since one bead only provides about 1-20 ohms of resistance at HF. A string of beads might do it if there is room. But seems to me that a good low pass filter in-line should cure the problem if indeed the cord is acting as an antenna.

Mike,

What is true for a radiating antenna is also true for a receiving antenna.
This is generally argued using a mathematical principle known as reciprocity.
But it stands to reason intuitively. If you imagine a probe antenna located
in the far field of a test antenna, then the amount of power transmitted
between the two antennae is the same regardless of which one is driven.
As you move the probe antenna around, you sweep out the radiation pattern of
the test antenna only. So it doesn't matter which antenna is driven, the
measured power versus position is the same.

Its generally easier to measure SWR using a directional device such as a
directional bridge. This requires a fair amount of power to take a reading.
To measure the antenna impedance without a transmitter, you can use a great
little gadget called a noise bridge. This device uses a broadband noise source
which you listen to with your receiver tuned to a frequency of interest.
Your antenna under test becomes one arm of a bridge circuit. In another arm
is a tunable resistor and reactance which you adjust until a null is heard in
the noise level. Then read off the antenna impedance on calibrated dials.
To be most accurate, you need to make measurements at the antenna itself. But
you can get good results at the receiver if you take into account the length
of the transmission line and its loss (See article in QST, August 89).

But Al is right, atmospheric noise dominates over receiver noise below about
30 MHz or so. Above 30 MHz, however, the situation changes and SWR and loss
can degrade signal to noise. As you get to UHF and microwave, atmospheric noise
gets very low and receiver noise dominates at which point you get very
concerned about losses and SWR so you mount an LNA right at the antenna.

So for a receive only situation, don't worry too much about SWR and line losses.
This seems also to say that receiver sensitivity (at HF) is not a big deal?
But a good set of filters and noise suppressors should be helpful.

Seems to me also that you want an antenna that has a low angle of radiation to
minimize the amount of the overhead sky that the antenna "sees". A simple dipole
is not too good in this regard. Sounds like a good arguement for a vertical
antenna of some type or of course a yagi if you have $$$ and space.

4638. Modifying Radios for out of band use

Newsgroup: rec.ham-radio
Date: 1989-12-08 17:49:33 UTC
From: wa2sff@cbnewsh.ATT.COM
Message-ID: <6455@cbnewsh.ATT.COM>
Source record: 14957

I have modified my Kenwood TS-140 to transmit out of band.
I did it for the express purpose of using it with
2 meter and 6 meter transverters that I am building.

28-32 MHz gives 50- 54 for the 6 meter transverter
28-32 MHz gives 144-148 for the 2 meter transverter.

I also plan to build similar transverters for 220 MHz and 432 MHz.

If that is not a ligitimate reason to modify the radio
I can't think of any better one.

I have not modified by TH215, TH25, IC228H or IC3210A for out of
band use but do have plans to get on 220 FM with a transverter
so might modify it in the future.

If I ban all radios that work out of band then I have trouble
with all radios made recently.
Take almost any 2 meter FM radio, set the off-set for +600 kHz
and select a frequency above 147.4. It will probably transmit.

My stock TS140 transmits on 10.000 MHz, 14.450 MHz, 29.701 MHz, etc.
Even my old Drake T4 would transmit out of band if I didn't set the
VFO correctly.

Novices and Technicians can't have any low band equipment that offers
coverage other than their band segments.

Same for Generals and Advanced.

Only Extras can own short wave radios and only if they don't transmit
out of the edge of the Ham bands.

Crystal Control for everyone. Must show license to buy crystal.

PS.

Has any one upgraded their TS-140 to operate on 6 meters
by adding the additional VCO and 6 meter power amplifier?

>.......

WELCOME to the radio.
Just a side note to what Chris says...I bought a Yaesu dual bander for 2m/70cm (144mHz/440mHz) and I find the 440 band to be very interesting. There are only 6 open repeaters I can use from Orange County, it's true, but the company is of high quality and the propogation characteristics are really different from 2 meters. I have not joined any private club yet, but I still find 440 to be worthwhile. I am looking for a way to get on 220, which I understand is also an interesting band. And, don't forget, if you have the money (or the determination to do it), there's always satellite work!

Hope to meet you on the radio someday.

>so blatant as to tell someone how, or request to violate the law is
>beyond apprehension.

Apparently the ARRL isn't smart enough to understand that some of us
also have licenses for other nearby services. Buying a tranciever for
Marine VHF and 2-meter ARS is both expensive and cumbersome. I like
a radio that gives me one-stop shopping. Get a clue, ARRL !

This spurs another question. I had always thought that in case of an
emergency that threatens life or property, you could pretty much
transmit wherever necessary to get emergency assistance. Intentional
interference notwithstanding, is this always true, or are there
exceptions ?

>
John,
I agree with most of what you said in your posting, and we can certainly
modify out radios in any way we see fit for ham use as signal generators or
transverter drivers etc. With reference to the quote from your posting above,
certainly transmitting out of band in an emergency as you describe would not
just be OK, but indeeed it would be moraly indefensible not to do it. Since
this is no longer ham radio, it follows that the same would apply to any
member of the general public. Therefore it wpould be a good idea if every
motorist, indeed everyone in the country, carried a transmiiter capable of
operation on police/fire/ambulance/ham/CB frequencies in case they came on
a similar situation. Can you see the potential for chaos? A better solution
would be a nationwide emergency frequency (similar to the FAA scheme) open to
all for use and monitored by all police/fire/emergency services. Please note
I don't disagree with most of what you said. I have been in the situation of
being first on the scene at a road accident (in rural NH) and having no way
of requesting emergency services - I would have transmitted on any frequency
to get them. My only point is that hams have no "extra" rights when it comes
to out of band transmissions, if its OK for you to have the equipment then its
OK for everyone, and that's a situation I wouldn't want to see. The potential
for abuse is great, it would only take a few irresponsible individuals to
disrupt emergency service traffic. There must be a better way to achieve your

ends.
73, Bob Atkins.

Sad when it happens, but this is NOT true. There is a lot
of help and advice given here and elsewhere when more specific
questions are asked. By saying "I know nothing, please help"
is like saying "I'm unemployed, please feed me".

Ask questions, and you'll get replies. You gotta do a bit of
digging fer urself. Nobody here had everything handed to them,
without some effort put in first. I know I still do plenty of
digging. Its unreasonable to ask someone to "tell me everything
I need to know".

(disclaimer-- I don't know what ur original
help request was worded like, but I've seen MANY, of the type
I'm discussing here. I felt it time to VENT a little).

> ... IT SEEMS THAT THE MEMBERS
>OF THE NET ARE ENGROSSED IN THEIR OWN LITTLE "PET" PROJECTS AND POSSIBLY
>CONSIDER THE APPEALS FROM "NEWCOMERS" AND "NO-NOTHINGS" NOT WORTH THEIR
>WHILE.

When you don't get the answers you need, crying about it does
not help. Do some more digging; think about the problem more; or
perhaps narrow the scope of the question. We all have a LITTLE time to
spare to answer SMALL questions, but as I reply to this note,
I'm not doing the work I'm supposed to be doing-- so don't expect
a lot. That's not being "engrossed"-- that's being responsible
to job and family.

>I APPEAL TO YOU FOLKS TO IF TIME PERMITTING, ...

Ahh, see! Even your subconcious knows that.

>... BEING SELFISH WOULD NOT NECESSARILY WORK IN OUR FAVOR!

er, I think ur saying, "YOUR favour".

I help a lot of people in the hobby, where I can. Most others
do the same. But we all have jobs (er, well, most I guess) and

many of us have families. It might suit YOU for us to neglect
everything to make it easy for YOU, but people's priorities
do not work that way.

Join a ham club. Join ARRL/CRRL, buy/borrow some books (please
don't steal :-). Don't just plead. That's too easy. None of us
got our tickets just by being "squeaky".

Flames off...

Anybody out there done any XTAL oscillator modelling in SPICE?
I'd be interested in hearing from anybody with oscillator/SPICE
experience.

Thanks,

C.D.T WB4HVD

I've used TV carriers in the past for monitoring propagation between
California and Hawaii. I built a dedicated Ch. 12 converter for monitoring
the carrier. It turns out that not all channel carriers are the same.
There are three possibilities (that I know of), The carrier frequency
is right on the "assigned" spot, +10 KHz or - 10 KHz. I think this is
done to reduce the problems a viewer has when there two stations
contending. The resulting hetrodyne apparantly is more managable when the
two stations are not zero beat. For this reason the precise carrier
frequency (-, 0 or + offsets) are staggered within regions having more
than one station assigned to a channel.
Channel 12 from Chico, California and Ch 12 from LA are not on the same
frequency and, as I remember, Ch 12 from Hilo Hawaii (I think) is on
a third frequency.
Even with a moderately strong local it may be possible to look for
a weak DX station on the same channel, at least to find out if there is
a path.

What I do with MY modified HT is call up BIG_CHEEZY 02 (callsign for the local Domino's base, land mobiles answer to PEPPERONI 01-99, maritime mobiles are ANCHOVY 01-99) on 154.48 and order a pizza direct, thus avoiding the autopatch question entirely. I only use the patch to avoid toll charges.

Of course, I understand that this communication is not protected under ECPA, at least not until I can get the out-of-band mods to cover 800MHz (can anyone send me those? Doesn't the ARRL keep a list?), but under the Comm Act of 1934, anyone immoral enough to monitor this and divulge my favorite toppings is toying with trouble...possible federal persec...uh...prost...uh...prosecution.

Is that such a crime? To quote a now-famous quote, "Who cares?" And why did I have to learn CW to do this? The Domino's guy didn't.

Since I'm sure there are at least a couple of readers who won't get it,

:-) I T ' S A J O K E ! S A R C A S M ! :-)

I agree with Mark Bitterlich, someone is just trying to stir up the beehive, let's all lighten up and move on. A little controversy and exchange of ideas is great, but while these topics ARE a logical part of this newsgroup, things have gotten too personal.

I see it now - in the dictionary, next to "anal retentive", there's a picture of a 110 year old ham pounding out CW on his homebrew rock-bound rig...

ARRL LETTER - December 1, 1989 - Volume 8 Number 24 - Part 1 of 3

CONGRESS AGREES: NO FEES FOR AMATEUR LICENSES!

The joint House-Senate Conference Committee, reviewing both versions of the Omnibus Budget Reconciliation Act of 1989, has approved deletion of the amateur license fees from the legislation.

In its report released on November 21, the Conference Committee stated: "Both the House bill and the Senate bill include fees on licensees in the amateur radio service. The Conference Report strikes all of the fees for amateur radio licensees. The Conferees recognize that amateur licensees do not operate for profit and play an important public safety role in times of disaster or emergency."

In the early morning hours of November 22, both Houses of Congress adopted the Conference version of the bill sending it to President Bush for signature.

In the current budgetary environment, avoiding fees altogether is an enormous accomplishment. ARRL congratulates all who played an active role in writing to their Senators and Representatives helping in this effort. Look for an upcoming QST article that will detail how amateurs won this important battle.

SIX METERS IS HOT!

November was the most exciting month in many years for 6-meter operators. From the East Coast, the band was open to Europe and Africa most mornings, and West Coast ops regularly worked into Japan and the Pacific. Stations in the Midwest have been able to work into Japan and Europe on many days as well. In addition, there have been spectacular transcontinental openings most afternoons. Signal strengths are generally good--often S9 or above for better-equipped stations--so anyone with a 3- or 10- watt radio and dipole can join in the fun. Six meters really heated up on Sunday, November 26: A few West Coast stations reported working into Europe, and Japanese stations were worked as far east as northern New England. Operators in the Midwest report that the band was packed with JA stations up to 50.400 MHz for hours. Conditions should be good at least through December and perhaps into January. If you've ever thought about getting on 6 meters, now's the time!

1989 BOY SCOUT JAMBOREE A SUCCESS

Ray Moyer, WD8JKV, Jamboree Coordinator of the National Office of the Boy Scouts of America, recently sent the following letter to ARRL and to others who had supported the Amateur Radio display at the National Scout Jamboree, held August 2-8, 1989, at Fort A.P. Hill, Virginia:

"On behalf of the K2BSA radio staff and the Boy Scouts of America, I would like to thank you for the use of your equipment at the 1989 National Boy Scout Jamboree.

"..K2BSA was located in a 20 by 40 foot tent in a dusty, hot area... We were able to work 157 countries, our new record, and all 50 states. Over 5000 contacts were logged and several thousand messages were sent via all amateur modes. We had countless messages coming into the Jamboree site also.

"One of the most exciting things at the Jamboree was that Amateur Radio was demonstrated to thousands of youth and adult scouters... I know of very few events where over 30,000 non- amateurs could have the opportunity to enjoy that type of equipment. Our staff worked very hard demonstrating Amateur Radio to our visitors. We had a continuous stream of visitors from sun up until late evening. Once the Jamboree was asleep the staff continued to

operate.

"...This is to say thank you for your trust and belief in what we did at the Jamboree. I can say now that our goals and hopes did come true."

ARRL LETTER - December 1, 1989 - Volume 8 Number 24 - Part 2 of 3

MICROSAT LAUNCH DATE ADVANCES

Arianespace officials have informed AMSAT-NA and the University of Surrey that the launch date of the MICROSATs and the UOSAT D/E satellites has been advanced. The launch date is now planned for January 9, 1990. This change in the launch date is the direct result of the postponement of a previous mission.

Launch preparations will begin on November 27, when the payload integration teams from AMSAT and the University of Surrey, along with their satellites, arrive in Kourou, French Guyana. All of the payloads should be fully integrated aboard the ARIANE IV rocket by December 23.

OSCAR satellite users should monitor the AMSAT HF/VHF Nets, OSCAR-13 Operations Nets, and watch the AMSAT News Service (ANS) bulletins for any further details concerning the launch of the MICROSATs and UOSAT D & E.

RADIO AMATEUR CALLBOOK SOLD TO BPI COMMUNICATIONS, INC.

On October 27, Herb Nelson, President and Publisher of the Radio Amateur Callbook announced the completion of the sale of all outstanding shares of Radio Amateur Callbook, Inc. to BPI Communications, Inc.

BPI Communications, Inc. publishes World Radio TV Handbook, a well known publication for short wave listeners. Glen Heffernan, Vice President and Publisher for BPI says that The Callbook "..is a natural complement to our publication..that will benefit both licensed amateurs and short wave listeners."

The Radio Amateur Callbook, Inc., has published The Callbook, a listing of all radio amateurs world-wide, since 1920. Located in Lake Bluff, Illinois, Radio Amateur Callbook, Inc. is the oldest commercial firm serving the Amateur Radio community.

FCC SEEKS INPUT/ASSISTANCE IN RESOLUTION OF AMATEUR DISPUTE

On October 11, FCC Special Services Division Chief Robert H. McNamara wrote to a number of individual amateurs seeking information and comments on phone patches, information bulletins and over-the-air telegraphy practice. The letter requested information and insight that could help bring a resolution to "the unfortunate continuing over-the-air dispute that takes place on the amateur 20 meter band..," a dispute ".. which is jeopardizing international goodwill -- a fundamental principle of the rules for the amateur service in the United States.." One recipient of Mr. McNamara's letter was W1AW Trustee John Lindholm, W1XX.

ARRL's response was submitted on November 15, by Counsel Chris Imlay, N3AKD in behalf of Mr. Lindholm as well as the ARRL. It begins with pertinent background information --

"Your letter correctly characterizes as unfortunate the over-the-air disputes that have arisen concerning certain operating practices that have come to be regarded as controversial. However, the League knows of no particular reason to include 'telegraphy practice' in the category of controversial operating practices. As will be discussed, the code practice transmissions from station W1AW continue to be widely used and appreciated.

"..communications on behalf of third parties has been a part of Amateur Radio from its earliest beginnings in the United States. The very basis for the formation of the League in 1914 was to organize amateurs to relay messages on one another's behalf in order to overcome the limited range of the amateur stations of the day.

"It was not until the 1930's that international limitations were placed on amateur traffic, at the insistence of European governments whose telecommunications monopoly was a source of considerable revenue. It was not until 1972 that the FCC specifically prohibited `business communications'. The imposition of these restrictions was itself quite controversial because it put amateurs, for the first time, in the position of having to evaluate the content of the messages they were relaying.

"Other background essential to an understanding of the issues raised concerns the concept of interference within the Amateur Radio Service and the extent to which operators are obliged to avoid interfering with one another. Willful and malicious interference is a violation of the rules, but interference that is merely a byproduct of normal operating is not. In the crowded HF amateur bands, avoiding causing unnecessary interference to others is extremely important to efficient operation; but a tolerance for interference and a willingness to cope with it as a fact of life is equally important."
. . . . (continued next part)

ARRL LETTER - December 1, 1989 - Volume 8 Number 24 - Part 2 of 3

FCC SEEKS INPUT/ASSISTANCE IN RESOLUTION OF AMATEUR DISPUTE (Continued)

With this as background, the League addressed Mr. McNamara's questions:

FCC: Is there a channel plan for the analog emission segment of each amateur service HF band?

ARRL: There is no channel plan; nor should there be, except in the very limited case where the operation of unattended stations may be authorized by an administration for good cause shown. The degree to which amateur stations can share the same or adjacent frequencies is dynamic: often, interference can be reduced to an acceptable level by making a slight adjustment in operating frequency. This would not be possible in a channelized scheme.

FCC: What portion of the analog segment of each amateur band is being used by FCC licensed amateurs for domestic and international third party telephony communications? What is the general nature of these communications? How many phone patches are transmitted per day by band? What effect does the transmissions of such communications have on the Amateur Service? Why aren't other communication services being used for such communications?

ARRL: In general, domestic third party telephony communications are a relatively small part of the communications being conducted at any given time. Their effect on other amateur communications is minimal except in the very limited instances where disputes arise as to the "right" of one station or group of stations to use a particular frequency. The League regrets that these disputes arise since no amateur has a mutually exclusive right to operate on a particular frequency. Such disputes could often be avoided if the operators involved were more flexible in their choice of operating frequency.

There is a greater temptation to use Amateur Radio inappropriately for international than for domestic third party communications, but abuses can be addressed adequately through enforcement of existing regulations.

FCC: What portion of the analog segment of each amateur band is being used by FCC licensed amateurs for information bulletin telephony communications? How many amateurs listen to these transmissions? How many bulletins are transmitted per day? What effect do these transmissions have on the amateur service? Why aren't amateur digital systems used exclusively for such communications?

ARRL: Station W1AW has transmitted brief information bulletins using telephony emissions for decades. It has been common practice for other amateur stations to conduct similar operations, usually on a localized basis, and usually as a part of a scheduled net or on some other limited, scheduled basis. Such bulletins are very important to the dissemination of timely and accurate information to radio amateurs. In recent years there has been a trend toward amateurs receiving these bulletins via digital modes: however, not all amateurs have access to digital modes, and the telephony bulletins still serve a useful purpose.

FCC: What portion of the analog segment of each amateur band is being used by FCC licensed amateurs for telegraphy practice communications? In view of the availability of recorded telegraphy training material, why are amateur service frequencies still used for this purpose?

ARRL: W1AW transmits Morse code practice in four one-hour segments on weekdays, and three one-hour segments on weekends. While higher speeds are used in Code Proficiency Qualifying Runs, the W1AW transmissions concentrate on the speeds that are required to pass the examination elements for FCC amateur licenses. This service is highly valued, and well accepted in the Amateur Radio community.

Audio cassette tapes and computer programs are useful tools but audio tapes can be memorized after they are used a few times, giving the user a false

sense of accomplishment; computer programs require expensive equipment. Neither method provides experience in copying Morse code under actual on-the-air operating conditions.

FCC: Suggest a statement of practices that you believe should be followed by amateur stations transmitting third party communications, information bulletins, and telegraphy practice.

ARRL: At the urging of FCC staff, the League in the mid- 1970's developed the eleven-point "Phone Patch and Autopatch Guidelines" that appears in The FCC Rule Book (Eighth Edition) at page 13-15. These guidelines have stood the test of time, and are generally accepted as a useful supplement to the Commission's Rules.

The League believes that the definition of the term "information bulletin" contained in the Commission's Rules should be strictly applied and enforced. Operators of amateur stations who cannot or do not wish to conform to these strict limitations may more appropriately seek licenses in the Broadcasting Service.

Finally, with regard to telegraphy practice, the only guidelines needed are to ensure that the purpose of the transmissions is to provide telegraphy practice and not to engage in one-way transmissions that otherwise would be illegal:
- The text should not be randomly generated, since such practice material is readily available via other media.
- The text should be taken from a published, readily available source to facilitate checking accuracy of copy.
- The text should relate in some way to Amateur Radio.
- The text should not be sent repeatedly.

Based on the response from ARRL and others, the FCC will consider its next steps in this on-going HF "dispute." Mr. McNamara says that possible alternatives range from FCC rule making that would ban all third party traffic on amateur frequencies to rules that would designate certain frequencies where only third party communications could be conducted.

SOUTHWEST OHIO DIGITAL SYMPOSIUM:
PRELIMINARY AGENDA AND SECOND CALL FOR PAPERS

A preliminary agenda and second call for papers has been announced for the 4th Annual Southwest Ohio Digital Symposium to be held on Saturday, January 20, at the Middletown Campus of Miami University in Middletown, Ohio. The preliminary agenda follows (at this time, there is still room for additions to the agenda). The lack of a call sign or name following a topic indicates that the speaker has not been confirmed.

o Packet radio for beginners including hands-on demonstrations (K8NHE and others)

Concurrent with the above, at least one, and possibly two sessions will be held on the following topics:

o Networking - Current state and next steps - NK8T

o SYSOPs' discussion group

o MicroSat and other topics of interest to AMSAT

o Alternatives to TNCs for handling node functions - AD8I

o Super-fast networking (for example, N3EUA's proposal of 1-Mbit/s networking on 10 GHz)

o MSYS PBBS software (WA8BXN)

o AMTOR and APLink

o Emergency uses of packet radio (W8MDK)

o TCP/IP and applications for Amateur Radio (N8EMR)

o An FM radio designed for digital communications (Karl R. Medcalf, WK5M, and Phil Anderson, W0XI, of Kantronics)

o Experiences with the TAPR packetRADIO

o 220-MHz band-planning

o Ohio Packet Council quarterly meeting (NC8Q)

The symposium is a cooperative effort hosted by the Engineering Technology Department of Miami University, the Middletown DIAL Twisters (Dial Radio Club), the Ohio Packet Council and the Cincinnati Buckeye Netters.

Kantronics will demonstrate their 9600-bit/s digital radio and other new hardware and will sponsor a packet-radio seminar on January 21 in coordination with the Symposium.

TERMINAL EMULATOR AVAILABLE ON CARTRIDGE FOR COMMODORE COMPUTERS

DIGICART>64, a cartridge version of DIGICOM>64, the TNC emulator program for the Commodore 64 and 128 computers, is now available. The cartridge features auto-booting, making it ideal for unattended operation; should there be a power interruption, the program (and parameters) will reboot automatically. The cartridge is also ideal for Commodore users without a disk drive.

A unique feature of this cartridge is the ability to rewrite and save parameters without the need for disk access. This is achieved by using a 2864 EEPROM for parameter and text storage. No battery backup is needed to maintain data storage.

Each DIGICART>64 cartridge includes a 25-page instruction book. Note that the DIGICOM>64 modem (see QST, April 1989, page 76) is required for DIGICART>64 operation.

More information on DIGICART>64 is available from:

Barry N. Kutner, W2UP
614-B Palmer Ln
Yardley, PA 19067

MICROSAT/UOSAT LAUNCH DATE PULLED IN

Arianespace officials have informed AMSAT and University of Surrey that the launch date of the MicroSats and UoSAT D and E satellites has been pulled in by ten days and is now planned for January 9. The date change is the

result of the postponement of another mission, designated by Arianespace as V35A, that was planned to lift-off on December 13.

Apparently, there are technical problems with the primary payload of the V35A mission and it will not be ready for launch on schedule, so, Arianespace officials decided to use this extra time to prepare for the next flight, known as the V36A mission. They feel that pulling in the MicroSat/UoSAT launch date by ten days is feasible because the MicroSats and UoSATs, along with the primary payload, SPOT-2, are ready to fly.

The launch campaign began on November 27 with the payload integration teams from AMSAT and the University of Surrey, along with their satellites, arriving in Kourou, French Guyana. By December 20, all of the payloads will be fully integrated aboard the ARIANE IV rocket and the teams will then return home on December 23. After a short Christmas break, the final AMSAT/UoSAT teams will travel back to Kourou and stay there to monitor their respective satellites until the launch.

The UoSATs have completed RF tests in the screen room at University of Surrey and have been exposed to low temperature tests in the clean room "freezer" at -20 degrees C. Marc Fouquet, designer of the CCD camera on-board UoSAT-E, has been taking "bench-mark" images for comparison with orbital images. Totally "black" images have been collected to provide data for image processing using the Transputer Data Processing Experiment - also on UoSAT-E in collaboration with the European Space Agency. Additional solar simulation tests had to be canceled due to the advance in departure date and the spacecraft are now undergoing final cleaning and assembly in the clean room.

Uplink and downlink calibrations in an RF anechoic chamber are planned providing that the chamber can be made available within the very tight schedule. Numerous visitors from several countries, as well as the UK, have recently come to the University to view the new UoSAT spacecraft.

from AMSAT News Service and UoSAT Mission Control Centre

AMSAT-NA SPACE SYMPOSIUM

AMSAT held its 1989 Space Symposium and Annual Meeting on November 3-5 at the Meredith Corporation's facilities in Des Moines. This facility provided an excellent meeting place for the hosting organization, the Central Iowa Technical Society. Radio amateurs from around the world traveled to Des Moines to be part of this event.

The Symposium began on Saturday morning with Jan King, W3GEY, Bob McGwier, N4HY, Tom Clark, W3IWI, Jon Bloom, KE3Z, and Harold Price, NK6K, presenting a detailed rundown of the MicroSat program. NK6K gave an interesting review of digital store-and- forward software, which he, N4HY, and Jeff Ward, G0/K8KA, are developing. Following the MicroSat discussion, Stan Sjol, W0KP, and Bill Clapp of Weber State College (WSC) summarized the CCD camera experiment and other scientific experiments which will fly aboard the WEBERSAT MicroSat. Also included was a sample high- resolution picture taken with the WSC CCD. Rounding out the morning session was Dick Jansson,

WD4FAB, who discussed the Phase IV geostationary satellite design effort.

After lunch, Courtney Duncan, N5BF, AMSAT Vice President of Field User Projects, discussed the many exciting activities related to OSCAR-13, for example, Operations Nets, ZRO Tests and the upcoming MicroSat launch. Then Franklin Antonio, N6NKF, presented his satellite tracking program, InstantTrack 1.0. After Franklin, there was series of papers about the exciting scientific missions in which AMSAT and OSCAR satellite users are being invited to support including the Solar Sail, Lunar Polar Orbiter and NASA's Small Expendable-Tether satellite experiments.

Following these papers came Jeff Wallach, N5ITU, Chairman of the Dallas Remote Imaging Group, who presented a paper on high resolution weather satellite image processing. Showing slides of weather satellite pictures processed on his IBM-AT computer, many of the Symposium attendees were overwhelmed by the pictures that N5ITU's computer produced. Bill Brown, WB8ELK, closed the day with his presentation on ATV experiments with balloons. Bill showed a videotape of his latest high-altitude balloon experiments in which one of his balloons reached an altitude of 133,000 feet! Attendees were awestruck at the sight of seeing the curvature of the earth at that height. Most interesting was the trip back to earth after the balloon burst with impact impending.

After an "attitude readjustment," the Symposium attendees returned to the Meredith Corporation facilities for the banquet and awards ceremonies. Over 50 awards were presented to AMSAT volunteers in recognition of their service to the AMSAT organization, the MicroSat program and the furtherance of OSCAR satellite program.

MICROSAT MODEM TEST TAPE AVAILABLE

If you are building one of the TAPR or G3RUH 1200-baud PSK modems for the soon-to-be launched MicroSats, a good way to bench-test your modem is by using a cassette tape which Jack Mathias, W9FMW, is offering. This cassette tests your modems without requiring a "live" signal. Also, you can be sure that the rest of your system is operating correctly before the launch of the MicroSats. To obtain W9FMW Test Tape For TAPR/G3RUH Modems, contact AMSAT-NA headquarters at 301-589-6062.

from AMSAT NA News Service

FULL-FEATURE PC TERMINAL EMULATOR AVAILABLE

RTP+ is a terminal emulator program written for the application layer of a packet-radio station. The program has been a labor of love over the past four years and has evolved into a very sophisticated program. It is an enhancement of RTP, which itself was developed from PTP with the intention of simplifying its user interface, while adding several new features. RTP+ runs on an IBM PC, PCjr, XT, AT or PS/2 with a TAPR-compatible TNC or

multimode controller, such as the AEA PK-232, Kantronics KAM or MFJ 1278. RTP+ requires IBM DOS 2.1 or later and works with the monochrome or CGA adapter. A minimum of 256 kbyte of RAM is required. The program is not copyrighted.

RTP+ provides numerous functions and modes for operating packet radio, CW, AMTOR and RTTY. The program is extremely versatile and fully configurable from definition files that the user creates. Functions included in this program are optionally sent connect messages, optional automatic issuance of commands to the TNC when starting and ending RTP+, optional automatic enabling of certain features when starting the program, two or three split-screen modes, a "Net Master" mode for more than two stations in a packet-radio QSO, optional connect alarm, background and foreground color selection, optional filtering of monitored BELL characters, optional receive and transmit anti-word-wrap (no words will be split across lines) and a quick save capture for both connected and unconnected packets.

The program also features an unattended personal mini-PBBS, choice of two cursor types (regular or big block for LCD screens), expanded function key capabilities, support of non-packet-radio modes (CW, AMTOR, RTTY for intelligent terminal units or multimode controllers), an optional personalized prompt on the center strip of the split-screen, configurable NTS traffic handling function and built-in traffic editor, selectable DCD detection for both TNC 1s and 2s, configurable scroll-back buffer and optional installation of new SET (TNC parameters) file from within a DEF file. Function key editing from within RTP+ is supported and all definition file commands can be edited from within the program. Other features include user-configurable tags for function keys, optional printer capture, on-line help, optional saving of scroll-back buffer to a capture file, receive and send scroll-back buffers, support for escape to DOS and return, optional communications buffer purge, performance of predefined DOS functions or commands, automatic sending of NTS traffic to a PBBS, uploading and downloading in ASCII, XPACKET, XMODEM and binary, recalling of previous sent lines, type-ahead buffering, a prompting utility to create DEF files and full dual TNC support via two COM ports. Also, optionally combined TNC commands in a file can be sent to the TNC,

More information on RTP+ is available from:

NO REPORTS.

QSL INFORMATION.....

D44BC WILL QSL VIA HIS CALLBOOK ADDRESS..... TU2BB HAS A QSL MANAGER OF N2HOS..... HI8BG WILL QSL VIA BOX 163-9, SANTO DOMINGO DOMINICAN REPUBLIC.....7P8DX ADDRESS IN THE 1988/9 CALL BOOK IS CORRECT.

NOTES OF INTEREST.....

IF YOU SAW THE CALLSIGN OF US1GB ON ANY MODE, IT WAS A SPECIAL CALLSIGN ISSUED TO COMMERATE THE US/SOVIET MEETING IN MALTA.

THE STATION WAS SITUATED IN MOSCOW, AND THE CALLSIGN SIGNIFIES
THE US SOVIET GORBACHEV BUSH MEETING. QSL TO UK3A.......
A61AD (UNITED ARAB EMIRATES) INDICATES THAT WITH A CHANGE IN
ANTENNAE IN ABOUT A MONTHS TIME HE SHOULD BE READY TO OPERATE ON
RTTY.....RL8PYL, ALEX, SAYS THAT THEIR APPLICATION FOR S1
(SPRATLEY) IS BEING CONSIDERED, AND THEY ALSO HAVE AN INVITATION
TO 7O (YEMEN) AND S2 (BANGLADESH), BUT THERE IS A SMALL FINANCIAL
PROBLEM AT THE MOMENT....... THE SHIP AURORA, CARRYING THE
CLUB BOUVET LANDING TEAM IS ABOUT HALF WAY TO 3Y5X (THE CALLSIGN
THAT THEY WILL USE ON BOUVET), AND THEY WILL BE ON RTTY 14085,
21085 AND 28085 KHZ FROM APPROXOMATELY 23 DECEMBER FOR 23
DAYS.....JA3EMV/JD1 SHOULD APPEAR FROM OGASAWARA ABOUT 31ST
DECEMBER UNTIL 8TH JANUARY.......NOW LETS HAVE SOME RUMOURS.......
VE3JPC HOPES TO OPERATE FROM SUDAN IN JANUARY, THERE IS SOME
DOUBT ABOUT THE AVAILABILITY OF A LICENCE..... JIM SMITH THINKS
THAT HE ALMOST HAS THE A51 DEAL LICKED . MORE LATER, KEEP FINGERS
CROSSED...... EA9JV SAYS HE MAY GO TO 7X (ALGERIA) EARLY
NEXT YEAR. ALSO THERE MAY BE A RETURN TO S0 (WEST SARAHA).......
BV4OA LOOKS LIKE A QUEER CALLSIGN, BUT IT MAY BE OK, JUST HOPE....

>a great difference between the 680 and the 726. I believe you will find that
>the 726 may have better receiver performance with very weak signals, and under
>high qrm conditions. This is due to Icom's DDS or Direct Digital Synthesis. ...
As an answer to the question, "Why should I pay for the 726 than for the 680,"
a superior receiver could be worth it to me. The 726 appears to have fewer
interference-handling facilities than the 680, though...the 726 has a noise
blanker and attenuator, while the 680 has a dual-mode adjustable-level
noise blanker, attenuator, and IF shift. Since we are virtually across
the street from the <insert your favorite descriptive expletive here>
woodpecker, a good noise blanker is worthy of consideration.

>> b) Both have rather wide AM selectivity. Are these useable SWL DX radios?
>I have listened to both on the SW band. For typical listening they both do
>a good job. For jam-packed band conditions I have no data.
Actually, selectivity may be a non-issue, even though QST's reviewer flagged
it. -6 dB at 6 kHz appears to be pretty standard for low- and mid-range
receivers. Only the high-end receiver specs I've looked at (eg, TS-940)
offer better selectivity.

>> I like the 726's receive sensitivity, and the 680's price...other than that,
>> they both have various (to me) minor pros and cons, but the choice isn't
>> clear-cut. Any advice would be appreciated.
>If you can, find someone who has these radios and invite yourself over to
>their shack (bribe them with pizza if you have to). Spend a few hours with
>each and do the kind of operating that you plan on. ...
I'd like to, if I can find someone. The people I know either have old rigs
like mine, or sooperdooper nuclear-powered $2K+ rigs. I'll keep looking.
Perhaps I should call CQ IC726?

The only e-mail comments I've received are from happy 680 owners. But I
would expect the 680 to have a larger following since it is older than the
726.

I also see the potential chaos, I never support the idea of a private
citizen being able to transmit on ambulance/police/fire, it would
be total chaos, your idea for a solution is a good one.
I support the fact that why should I go and buy four different radios,
when one will do it, and the only purpose it will be used for in a non
amateur capacity is in an emergency, one that relates to special
training that I have received to deal with.

>
>
>Al N1AL

You know, this has troubled me ever since I used a "beverage" antenna -
an ultra-long-wire running very close to the ground. Such an antenna is
a real dog to use for transmit, but seems to work very well for receiving...
Is it merely the reduction in noise on the beverage antenna that makes it
such a fine receiving antenna...and the reason that 160/75 meter DXers will
use a separate antenna for xmit and rcv?

Thanks for any ideas the net might have to help me with this concept.

4657. TS440S(/AT) vs ICOM 735

Newsgroup: rec.ham-radio
Date: 1989-12-09 00:33:54 UTC
From: lewisn@hpnmdla.HP.COM
Message-ID: <1250097@hpnmdla.HP.COM>
Source record: 14832

I appreciate the recent comparison between the ICOM 726 and the Kenwood
TS-680S.

I am trying to decide between the ICOM 735 and the Kenwood TS440S(/AT).
I have been able play with an ICOM 735, and like what I see. I have
data sheets and copies of QST reviews for both. I would be interested
in any comments of users of these units, in particular the TS440S, since
I have not been able to get my hands on one yet. I like what I read and
see in the data sheet, but I do have a few questions.

Regarding the TS440S...
Do you like the radio, glad you bought it?
The built-in auto-tuner looks like an advantage, how feel about this?
Filters, how they work, recommendations on which to buy.
Which can you install concurrently?
How does the IF shift work compared to the ICOM's passband tuning,
which I have played with. As good for picking out signals?
How work for serious AM SW broadcast listening? Filter recommendations
regarding?
The QST article suggests that with weak AMTOR signals the TS440S might
have a problem due to slower receiver turnaround at weak signal
levels. Is this true, and how compare to the 735, which I have seen
no comments about? (It is said to be OK for moderate to strong levels.)
How does sensitivity and ability to pull in weak signals, or signals in
crowded band conditions, compare between the two units? I am
thinking of past comments about the TS680 not being as good as the IC726
in this area. How is the TS440?
How does the reliability of the two units compare?

Any comments about any or all of these questions,
or just some general comments and impressions,
about either of these radios, would be appreciated.

Chage "fuddy duddy for" to "fascist" and "bad manners" to "freedom" and this will be a more accurate description.

If I wanted to read the type of fidonet excretion posted to this news group of late I could do so by dialing any number of local bulletin boards. Is it really necessary to waste network bandwith transmitting such drivel?

No :{) intended.

From the "VMC Media Law Newsletter" (online edition 1 Dec 89; provided by
VITRON's ACTIVITY BULLETIN BOARD SERVICE - ABBS (914) 779-4273

FCC FORMS INTERNATIONAL UNIT

By: James Spinelli

The Federal Communications Commission announced on November 3rd
that it is forming an office to deal with international communications
issues.
The new unit, called the Office of International Communications,
is being established to deal with "the increasingly global character of
communications issues," the FCC said.
The office will help ensure the coordination and integration of
the commission's international policy activities. It will also ensure
that the FCC's international policies are uniform and consistent and
will serve as the focal point for the agency's representation before
international organizations.
FCC Chairman Alfred Sikes said the establishment of the office is
a prime example of how the FCC plans to promote the interests of the
American people in international communications and competitiveness.

>Thanks, C.D.T WB4HVD

No SPICE experience here, however, a very highly recommended book on the subject is:

Crystal Oscillator Design by R.J. Matthys, Wiley & Sons, 1983, ISBN 0-471-87401-9.

No ****, this really happened: I went to a bookstore to check the availability of the above title. The bimbo in the store looked at it and said, "What kind of clothes does Crystal Osculator design?"

I'm waiting for my novice ticket at the moment, and I'm excited about finally getting into ham radio. An old friend of mine told me that if I really want to get to know the hobby, one of the best ways was by building my own rig... which sounds like both a lot of fun, and possibly a bit cheaper. Can anyone suggest books to me that would help me out? I have a college education, so assume I'm on the "fairly intelligent, but not TOO technical" level :-)....Also, does anyone know of any other companies that make ham rigs from kits (besides Heathkit/Zenith) ? I've got a Heathkit catalog, but I'd like to look into making a rig that can do SSB as well as CW. All they've got in kit form is a QRP CW rig.... In anycase... any suggestions would be helpful. Please send 'em to me personally or to the net...I will be glad to summarize responses to save netwidth.

73 de I'm still waiting for the durn thing!

R. Todd Perry
PERRYR@WABASH.Bitnet

(as everyone breaths a sigh of relief after reading a message directly related to ham radio..... ;-))

Information is available from:

Journal of Environmental Satellite Amateur User's Group, published quarterly by:
Gregory P. Mengell,
2685 Ellenbrook Drive,
Rancho Cordova,
California, U.S.A., 95670,
(916) 364-1572. ($US24/year, $US32. overseas Air)

They have published a bulletin for quite a while and have a collection of papers available ("Collection Volume 1, The First Years, 1983 - 1985", price- I forget! <$50)

The Educational Programs Branch, Office of Public Affairs, NASA Goddard Space Flight Center, Greenbelt, Maryland, 20771 published "Teacher's Guide for Building and Operating Weather Satellite Ground Stations for High School Science" in 1981. Publication # NASA EP-184. It has lots of introductory (and other) level information and good photographs. Good if it's still available.

Dr. Ralph E. Taggart (WB8DQT) of Michigan State Univwersity, wrote the "Weather Satelite Handbook". I got the third edition thru '73 magazine I think. It has quite a bit of good introductory information although some technology is quite dated.

Another source of information would be the National Weather Service at some larger regional centre. Some of the information you desire may be on the low band FAX frequencies (8080 KHz for example) as re-broadcast by the Navy. The direct satellite downlinks are around 137 MHz for the Soviet Meteor-XX and NOAA Polar Orbiters, transmitting WEFAX on a 30 KHz wide channel. The geostationary satellites transmit on 1691.nn MHz (the same WEFAX) and both they and the NOAA polar orbiters send wideband digital data (2.2 MBit/S) on a couple of channels slightly above 1700 MHz. I don't know the actual allocation to thermal imagery in the data, but you can probably get it from NOAA, NWS or the amateur

group.

There is a WEFAX list at "wefax@ida.org" (send human readable mail to request subscription to "wefax-request@ida.org" first outlining your interest in the list). Information I have received so far gives operational schedules and formal NOAA announcements.

You might get some information from local television stations in major markets near you. They often have their own earth stations to provide real data to the on-air meteorologists which have become fashionable now-days.

Regards, Stu Beal, VE3MWM, (U009@CCIW.BITNET),
National Water Research Institute,
Burlington, Ontario, Canada.

I have been reading the pros/cons of modifing radios to transmit out-of-band (especially on 2-meters and there about)... I have a Kenwood TH-215A hand-held and know that is is modifible to extend the transmit band range. (MARS /CAP.) My question is: How is this done? Does one buy extra guts and solder them in, or is it a secret code to enter on the keypad? If anyone knows, please let me know here or via direct mail.
Thanks in advance.

I've used homemade discones for years - they work great, are really easy to make (a piece of coax, a broom handle (!), and some wire screening - total cost under $5 - and you've got yourself a pretty neat antenna!

Sorry about the last response, I tried incorrectly to abort it.

As long as you're taking a survey, why not get some info on
operating habits, equipment, antennas, %cw vs phone activity,
%hf vs vhf or uhf activity, license class, etc. I'd find this
info useful (although I'm not volunteering here to collect it :-)

The Chicago Fire Department has two geographical divisions: 'Chicago North' handles everything from 39th Street north to the city limits. 'Chicago South' handles everything south of 39th Street. Southside calls are routed through the Englewood Fire Alarm Office; northside calls are routed through the fire alarm office at City Hall.

153.770 Englewood Fire Alarm Announcements
154.130 North - City Hall Fire Alarm Announcements - Also includes Ohare.
154.220 Fire Department Administration
154.265 Mutual Aid Frequency between Chicago and suburbs
154.385 Used at scene of fires to supervise firefighters

460.600 Paramedics; Ambulances North *
460.625 Paramedics; Ambulances South *

*These two frequencies are also on police radio 'channels'.

806.9125, 807.8625, 807,9125 are used to transmit medical information to the hospital by paramedics.

Some other Chicago area frequencies of interest are --

471.6625 Chicago Board of Education. Listen to Truant Officers, others.
453.9000 Chicago City Colleges Security Officers; all branches.
158.8050 Ohare Airport Administrative Operations
453.8250 Department of Human Services; listen as case workers try to find shelter and peace of mind for the latest victim of a crime or fire.

The Salvation Army (461.500) and American Red Cross (462.550) can be heard on the scene at disaster sites also giving assistance.

453.9250 Metropolitan Sanitary District
151.190 Chicago Park District maintainence workers

With the proper equipment, you too can read the transmission to/from the data terminals in some Chicago Poh-leece cars: 865.8875, 865.9125, 865.9375

173.2750 and 173.3750 are used by the [Chicago Sun-Times] reporters at the scene of a news story to report back to the city desk.

==========

Cook County Frequencies --

Cook County Sheriff's Police: 153.7850, 153.9050, 153.9350. 153.9650

The guards at Cook County Dungeon work on 153.8150
The Department of Corrections also uses 154.0250; and 158.8650 for the transportation of prisoners.

Cook County State's Attorney: 159.0900

The various police departments in south suburban Cook County communicate with each other and the Cook County Sheriff's police on these --
470.7625 470.8125 470.8625 470.7375 470.5875 470.4125

The University of Chicago Police do their thing on 155.1600 & 155.3400

From: tad@ssc.UUCP
Message-ID: <311@ssc.UUCP>
Source record: 14846

WB9MVP asked for info on FCC rules regarding RFI susceptability and telephones.

Unfortunately, there aren't any. In fact, the FCC doesn't even require telephones to FUNCTION in order to be registered! All that FCC registration requires is that they not generate any signals that would "harm the network".

The big RFI problem with the el-cheapo and many electronic phones is that they have the entire telephone on an IC, which is line-powered by a zener diode in series with the line! Of course, the line makes a dandy antenna. The diode makes a nice detector.

When my neighbor's $12.99 Radio Shack phone picked up my SSB on 20 mtrs (for some reason their line was running across MY backyard to the pole!), Radio Shack told them I needed to get a "filter" for my transmitter!

As if harmonics were causing the problem....

I track weather satellites daily using a modified version of orbit23
which reads the NASA prediction bulletins which TS Kelso (used to?)
posts on rec.ham-radio. It works very well for me, although I only use
it to calculate the general direction of the satellite, when it will be
over the horizon, and the doppler shift (necessary to get a uniform grey
scale in the infrared pictures). Since I use a dipole antenna I don't
have to point it that precisely, so I don't use the azimuth and
elevation produced by the program except to be sure there won't be a
wall or post in the way of the antenna when positioning it. The
satellite subpoint calculations are, however, correct, since I use those
to identify things on the image when the outline of the continent is not
visible. When the outline is visible, it matches what the program
calculates. I've never noted any problems with the program in using
it for nearly a year.

It runs on a Sun 3/60.

Now available is a cartridge version of Digicom64, the software-based TNC emulator for the Commodore 64 and 128. The cartridge is autobooting, for instant loading. Should there be a power interruption the program and parameters will re-boot automatically.
A unique feature of the cartridge is the ability to rewrite and save parameters without disk access. This is made possible by use of an EEPROM. Unlike RAM, this memory device requires no battery backup.
The cartirdge is available in kit or assembled form. For further info contact: Barry Kutner, W2UP, 614-B Palmer Lane, Yardley, PA 19067

Don't be absurd - you missed the point entirely. How about this: most
newsgroups, about once a month or so, post a sort of "charter" - the
best one I have read is for comp.lang.forth - that states a little
bit about the topic (for beginners), answers questions that would
otherwise pop up bi-monthly and linger on and on (airports and HT's,
etc)., and, most importantly, states WHAT TYPES OF MATERIAL ARE AND
ARE NOT APPROPRIATE to the newsgroup. We have no such thing here.

>Why not do us all a favor and unsubscribe? I'd
>rather see heated political discussions than listen to your shit.

Ha. Nice try. Well, let me finish with this: rec.ham-radio is a
very popular newsgroup, and it has reached far outside traditional
'usenet', including crosslinks into local BBS's outside of Usenet
and even to ham radio itself.

Might not hurt to come up with some "intro to ham radio" to be posted
say, monthly; the rest of us can press "n" if we wish, and we can
teach newcomers what belongs here vs. sci.electronics, rec.radio.swl,
and rec.emotional-outbursts.

>Steve Sampson, N5OWK, S.O.B., etc...

>[...] It was
>not until 1972 that the FCC specifically prohibited `business
>communications'. The imposition of these restrictions was itself quite
>controversial because it put amateurs, for the first time, in the position
>of having to evaluate the content of the messages they were relaying.

This is most interesting. I have heard of the "Eyebank Net Docket" and the fact that it prohibited communications even for non-profit organizations, but is it really true that there was no prohibition at all on business communications in the amateur service prior to 1972? I'm embarassed to admit that I don't know the answer to this, since I was first licensed a year earlier (1971).

Consider the following points:

1. The motivation for banning most international third party traffic was to protect lucrative European government telephone monopolies.

2. If I understand the ARRL correctly, the US amateur service got along just fine without any prohibition on business communications until as recently as 1972.

3. In 1972, the very same year the strict prohibition on domestic US business communication over amateur radio was imposed, the Bell System launched an all-out war against competition in all forms (e.g., MCI et al). (See the book "The Deal of the Century", by Steven Coll.)

One wonders if the timing of these last two events was a coincidence. Given that the anti-competition war ended in surrender by the Bell System, perhaps it's time that this rule (and the reasoning behind it) were re-examined. With the high speed digital networks now under development, the rules for message-by-message approval by an amateur operator of all third party traffic are becoming even more impractical.

For example, it is entirely possible, technically speaking, to take a couple of N6GN's megabit microwave transceivers, attach some codecs and digital multiplexors, and have a portable 100-line trunked telephone system that could be set up for free public use in a disaster shelter. But to operate legally, such a system would have to have 100 amateurs on hand, one to monitor each voice channel to make sure no improper communications were passed! Ridiculous.

The potential for this technology to provide a "voluntary noncommercial communications service" to the public is severely stunted by these rules. The likely result will be a service that is even more irrelevant to the modern world and unable to defend its shrinking allocations. (The microwave

bands are almost certainly next, by the way.)

It has always seemed to me that any abuses of the amateur service by commercial interests would be automatically self-limiting as long as you enforce the basic characteristic of a radio amateur that is inherent in the word "amateur" -- that he receives no pay for his services. Human nature being what it is, there aren't many people who will gladly volunteer their time and facilities to make money for somebody else when they can't get a share of it. I would think this would be *especially* true for hams.

Phil

While it would add a little expense to cellular phones to be encrypted,
perhaps a more realistic reason than the ECPA was passed, even though
even THEY might have believed it to be unconstitutional, was that it would
get cellular systems popular to begin with. Later, when the law is overturned
"they" will come out with "Cellular II" which is encrypted and highly secure.
Now they have the market developed, and forcing a massive product turnover.

But then, we will get all the junked 800 Mhz hardware :-)

Why do you think that the monitoring stuff should be in rec.radio.shortwave?
There are those who do one or the other and don't want anything to do with
the one they weren't interested in. By the NAME of the group, shortwave
listening goes there, but monitoring is still left out in the cold, and most
people still expect it to be HERE. So until someone gets off their other
end and sets up rec.radio.monitor I will continue to expect it to be here.

I can't find any newsgroup called rec.swl or anything like that around here, so I figured why not post it here (rec.ham-radio). Sure is better than any of the threads we have now!!
Many people have been asking about the WEFAX 105 program. This program does it all. It allows you to receive faxes from any radio right through the CoCo's own cassette port (I'm sure most of you know what a Color Computer is, right?). NO interfaces are required!!
So what do you need and where can you get this? First, you need ANY version of Color Computer with 1 disk drive. Then you need a cable to connect your radio's earphone jack to the audio input of the CoCo's cassette port. And of course, a TV. THAT IS IT!!
As for the program, it has been uploaded to the listserver at Princeton U. To get you started, send the following mail message to:
listserv@pucc.princeton.edu
help (note all of these are on one line. THEY MUST BE THIS WAY)
get coco filelist (this is where you'll find WEFAX 105)
get os9 filelist (other great stuff for OS9)

Hope this helps some to the many who have been asking (or begging :) for this program. 73's (best wishes for the non-hams),

What's wrong with modifacations ??

When I bought my Kenwood TH-75E handheld in the summer, the people who sold it to me (in England) asked whether I would like it to be modified to cover 130 to 170 Mhz (and 410 to 460 Mhz) receive, and a little out of band transmit...

Naturally I said yes and the xcvr arrived fully modded with the guarantee still intact. This is very commonplace in England and, as far as I am aware, there is no opposition from the DTI (our governing body).

The DTI will, quite naturally come down very heavily on anyone actually transmitting out of band...

By the way, I'm new to the newsgroup and I'm not too sure whether this article is actually getting outside Swansea University, Wales. I would be very greatfull for any reports of where it reached...

I think I can be mailed directly by either of the two following addresses:

cs9h9ral@uk.ac.swan.pyr
cs9h9ral@cybaswan.UUCP

Unfortunately, channel 9 is on a frequency that is often not useful for
local communications (which you assumedly want if you're looking for
police/fire/emergency commo.) You really need something in the VHF/UHF
frequency range. Talking to west Texas from Massachusetts can be fun in
some instances, but not if you're trying to get an ambulance.

Source record: 14859

The charter of rec.radio.shortwave specifically INCLUDES monitoring, on all bands. Unlike the elitist asses on rec.ham-radio, the founders of rec.radio.shortwave (and the voters) decided to include ANYTHING remotely close to monitoring shortwave radio. This includes to a certain extent longwave, mediumwave, and VHF and UHF, including TV if necessary.

The problem we seem to have with the group is lack of connectivity in places. Bill Parnass has been unable to use the group because the ATT machines haven't created the group. This is also true of many others.

Those who would like to access rec.radio.shortwave, but aren't on UseNet, may join the companion mailing list: SWL-L. To join, send a one-line message consisting of:
SUB SWL-L Your Name

to the address listserv%cuvma@cuvmb.cc.columbia.edu, or listserv@cuvmb.bitnet.

I for one would be happy to stop reading about Pizza, Out-of-band mods, and 14313, but I still read rec.ham-radio to catch the SWL posts from those who haven't been able to switch yet.
I do not post SWL info to this group.

Mark
p.s. For those who are curious, the callsign below is a Registered Monitor Station ID.

Still, this is AGAINST the LAW.... As I said in my posting, MOST
hams think because a radio is able to meet (or exceed) the specs of a type
accepted radio, then it is OK to use in commercial service, WRONG!!
If it was ok to do this these days, then manufacturers would skip the
type acceptance procedure, and would be able to bring radios to market for
less money. And they would just love to do this, because if the cost comes
down, then more people would buy them, hence more profit.

We need to show that we (Amateurs) are reponsible, and will abide
by the laws... If we think that the laws are improper, then lets get them
changed, not disobey them because we think that they are improper.

> Lastly, is common sense. This posting really addresses common sense,
> a commodity sadly lacking in today's hams. And this is typically

I agree with all of these, they do not include transmitting in
a non-amateur service (for the sake of arguments, I will assume transmitting
means RADIATING a signal).

>
> Lastly, assume for the moment that what I've said is not true and that

>
> John
>

Evil, NO, illegal YES... If we are not resposible, then we will pay
the price...

I had hoped for a discussion on how we could continue to be accountable
for our actions, stating emotional items is not being responsible (i.e: If my
radio meets or exceeds the specs of a type-accepted unit, then it is OK to
use in the commercial service).

I hate legalese (there are too many disclaimers in this world), and
people SHOULD be held responsible for their OWN actions... How can we handle
this???

I agree that a reason for modifying a radio for TRANSMIT coverage for
use as a signal generator, or input to a transverter (etc) is OK. Yes there
is no law against modifying a radio, but there is rules against transmitting
on a service without a type accepted radio.

But, MOST hams these days don't do it for these purposes... I was
asked what I base this statement on. I have in the past couple of years made
it a point to ask each person who I have heard on the air (or off the air)
why he/her wants to modify their radio for out of band transmit. Not one
of them said "for use as a signal generator, or to drive a transverter".
I received the following type of answers:

1) I don't know why, I like to have all the options on my radio.

2) So I can transmit on police/fire frequencies "just in case".

3) So I can transmit on commercial frequencies, because Amateur gear
is less expensive than commercial gear.

4) Because it increases the value of my radio when I go and sell it.

If you think I am kidding, try asking people yourself. Or spend 20
minutes standing infront of one of the guys that "sells" modifications at
the ham-fests... and ask why people are paying this guy to modify the radio.

Many hams gave Radio Shack a VERY HARD TIME about selling a radio
(that was type accepted) that could transmit on the ham bands (10 meters).
Why??? Because we thought that people were not informed that a license was
required. Some felt better when the shack started including a note that
an amateur license was required to operate the radio in the ham bands.

Should we require a notice with each intruction on how to modify
a radio for out of band transmit:

Note: It is illegal to transmit with this radio outside of the
Amateur Radio service. When modified, this radio HAS NOT
PASSED TYPE ACCEPTANCE for the commercial or public service bands.
Under NO CIRCUMSTANCES should this radio be used in any
service when transmitting EVEN if you possess an operators
license for the service in question.

I hate this type of thing, (and am not a lawyer type, so the wording
could probably be made more understandable).

Any ideas????

Rich

I am interested in knowing if thre are any known modifications to the old Kenwood 520SE HF tranceiver. Any other information about the rig would be helpful.

I just got a ham license and bought this as my first rig.

I have used it to make nearly 100 contacts so far, and I think I know what there is to know about it, but others may have additional information than isn't in the manuals.

I am particularly interested in knowing if there is any way to modify it to work on the WARC bands.

I have the speaker and external VFO for it, but don't have the digital display. If anyone is interested in letting one go, let me know.

Thanks

John Anderson N5OPY

I've used this same circuit very successfully on the line inputs to telephones.
It always seems to work.

The caps used across the tip/ring line, however, need to be rated for at least
250V. The ringing voltage can be 120V RMS or higher (90V RMS is typical), which
yields a 170V peak. This is superimposed on a nominal -48VDC battery voltage,
which can be as high as -56VDC. All this adds up to more than 225V peaks during
ringing.

The FCC requires, in fact, that telephone input protection devices can't kick
in below 250V to avoid clipping peaks during ring.

4692. Wanted ROTOR and AMP.

Newsgroup: rec.ham-radio
Date: 1989-12-11 17:50:16 UTC
From: anderson@ngstl1.csc.ti.com
Message-ID: <8912111803.AA29505@ti.com>
Source record: 14892

I am looking for a used light weight rotor to use with the small TEN-3 10 meter mono-bander.

I also am looking for a good used linear amplifier for a missionary friend in New Guinea(P29MR). She doesn't seem to be able to get out too well, but can] here me fine. It needs to be fairly inexpensive. Perhaps someone needs a tax write off. It could be arranged.

Thanks

John Anderson N5OPY

4693. Mac vs. IBM: IBM wins

Newsgroup: rec.ham-radio
Date: 1989-12-11 18:44:53 UTC
From: KENDALLG@VTVM1.CC.VT.EDU
Message-ID: <8912120807.AA01074@ucbvax.Berkeley.EDU>
Source record: 14883

THANKS MUCH for all the very helpful responses I received in making my
decision on which system to get. I have to say if I really had the extra
$$$ I'd probably go ballistic and buy a Mac. However... being practical
made me decide to go for building my own IBM-clone machine.

I've got a nice copy of 'Computer Shopper' (Dec. 89) now to read through;
if anyone would like to offer good/bad suggestions on suppliers for 'build-
your-own' systems I'd really appreciate it. A couple of specific questions
I have so far are: 1) XT vs. AT vs. 286/386 - which is best?
2) 5.25 inch floppy drive - 360K, 720K or 1.2M?
(Are there any drives than can handle > 1 format? I'd
like some flexibility for being able to trade software
with other people/systems; I already plan to install
a 3.5 inch drive as well)
3) Operating System - I know MS-DOS is the 'standard';
what about Unix?

I realize this is really a Ham mailing list, but since I'm hoping to evenutally
get seriously into packet (among other things in ham radio) I'd be grateful for
input from those of you who already have such systems up and running. For
example, is it possible to have a TNC setup running 'background' while doing
something else with the PC, like playing Adventure? :-)

Thanks again in advance... '73...

Well, actually, during the discussion period for r.r.sw, and during
the call for votes, it was made clear that VHF and higher (scanners,
TVRO, etc.) was part of the charter for the group. The name was
chosen (after much debate) because we couldn't come up with another
one that accurately described everything that was covered
(rec.radio.hobby? Nah, sounds like kit building or something.
rec.radio.monitor? Sounds like a group just for scanners.
rec.radio.listen? Sounds like discussions of top-40 radio.) Name
notwithstanding, scanner enthusiasts have been part of the target group
for r.r.sw since day 1.

The notion of encrytion of public communications is an oxymoron. In order
for encryption to afford security, the method must be known only to a few
who have a need to know; then it should be changed at irregular intervals.
When the system is changed, all users would have to change. Now project this
to the general population, where both the system in use and the effective times
are more-or-less common knowledge due to widespread dissemination. Forget
encrypted cellular systems, except as just another sales point for the industry.
encrypted cellular systems, except as just another sales point for the industry.There will
be enough folks who will be willing to divulge the system/timing
details to make it entirely useless. Like "Quality is Job One", it will be just
another slogan.

Patrick:

I agree with you in principle, but it appears that you have never approached the monolithic organization with an idea that is new or different....such ideas are not usually met with open approval - even if obviously meritworthy. There are many hams who deserve all our respect who leave the League for good reasons and do not deserve the title of "whiners" - as they can do the job that the League can't or won't elsewhere.

You mention that the ARRL IS its members. I find, in my experience, that this is naive, but well intentioned of course. The organization does not have to pay attention to its individual members, and can even occasionally get around the majority...though the majority, if energetic, can make the thing move. Then again, even a majority does not guarantee wisdom (and even if the ARRL was completely responsive, it might not work for amateur radio in the long run - many of us hams are well intentioned but ill informed or just intransigent in our opinions.)

The way to change things is to stay and fight? Good for you! This can, of course, help to change the organization (and take all your time, tapping into other areas of your life with no guaranteed return for your efforts, it can embitter you as you meet the opposing forces and learn their motives...) Some find it better to NOT be a party member in the one-party system of the ARRL, and contribute to amateur radio through the infinite ways that are available (just being good, decent hams; ensuring good publicity for amateur radio in general; adding their opinions to the crowd when the FCC is in session, etc.)

While I generally applaud the ARRL as a solid organization with all good intentions respecting amateur radio, and I even participate in some of the activities they organize...I choose not to be a member because I see my part in amateur radio singularly missing from the actions and words of the League. I play my part elsewhere, and I believe that it is just as important and more efficacious for me to do so individually and as a non-League member of the community.

Respectfully,

Clark, WA3JPG

Date: 11 December 1989, 15:54:18 EST
From: WMLBTAM at UCCCVM1
To: INFO-HAMS at WSMR-SIMTEL20.ARMY.MIL
Subj: BUSINESS allocations

I know this isn't strictly ham-related (how much of the traffic here IS, nowadays!?) but I figure that HERE'S WHERE THE KNOWLEDGE IS.

My wife's library is trying to use radio modems to link terminals in their book mobiles to the mini in the main library which handles circulation records.

The company who handled their data communications says the frequencies they're using (sought and selected by the company on the library's behalf) are o.k. for both voice and data communications. They've received a complaint of interference from a couple of other folks (they were TOLD they had the channel to themselves in this area!) that, not only are they interfering, but that it's because they're running data on these channels when they're only authorized for voice.

Does this make any sense--do the business band allocations have voice-only and data-allowable sub-allocations? BTW, her freqs are 461.4/466.4MHz.

Thanks for any info/comments...

Ted

You know, the 90VAC ring will cause a neon bulb to glow.
Once I put a neon bulb, less the usual dropping resistor, across the
line and had Dad ring the number. Each time, immediately after the
first ring, he'd get a dial tone, as if I had picked up the phone and
then hung up FAST.

The nearest I could figure: the bulb would get 90V or more and
start to glow (and thus conduct; the neon ionized), the switch (at
the telco office) would sense the conduction as an off-hook condition
and connect stopping the ring, the bulb stopped conducting opening the
circuit again, the switch saw the open curcuit and "hung up".

TO ALL SCANNER OWNERS IN THE SOUTH-EASTERN STATES:
(and anyone else whose interested)

I am sending out a "feeler" to see if there is any interest in
setting up a mailing list of scanner-users in the SE U.S. I could see this
list as a local supplement to SWL-L/rec.radio.shortwave, which appears to
be establishing itself as a national list for all types of monitoring
(150kHz - 800mHz+). Since much of the scanning hobby has a local appeal,
a regional mailing list might be in order. (other regions may wish to have
the same).
Gregg Stefancik at Clemson has offered to establish an unmoderated
mailing list if the interest is there. So if you are interested in having
such a list, drop me a note at: pswecker@med.unc.edu

-- Peter St.Wecker (RCMA NC097 [I think!])

I tried the un-net last Saturday, and got assaulted by contesters. It
also seems that each 5 KHz multiple is busier than the in-betweens.

I do wish that contest organizers would set up band restrictions. 29.300
through 29.600 was completely full. I had to go all the way up to 29.650
to find an un-contested frequency.

4709. Re: SPICE

Newsgroup: rec.ham-radio
Date: 1989-12-12 00:03:53 UTC
From: timb@hpmwtd.HP.COM
Message-ID: <1260010@hpmwtlb.HP.COM>
Source record: 14866

It depends on what information you want.

If you want to do full blown non-linear simulations then, yes, you need a simulator like spice. However, if you only need to make sure that your oscillator starts up, then a small signal simulation is all that is necessary. This can be done with any of the linear simulators on the market.

Spice is not the best tool for doing oscillator modelling. The main drawback is that it solves the diff eq's in the time domain. Thus, any steady state simulations (which is what you are usually interested in for oscillators) must run until transients have died out which may be several hundred or even thousands of cycles. This is very inefficient and time consuming.

Also my experience with spice shows its models to be very poor. I haven't used some of the later versions of spice so maybe this has been addressed somewhat but I remain skeptical.

If you must do non-linear modelling (to look at harmonics or compression) then you should try to get your hands on one of the harmonic balance simulators. The harmonic balance technique solves the equations in the frequency domain and is very fast compared to spice. Three companies offer such a simulator; EESof, Compact Software and *HP* but these are big $$, whiz-bang items. I don't know of any packages that are within the price range of the average ham (maybe there's an opportunity here?). At any rate, any self-respecting electronics company or university should have a copy.

Even with the harmonic balance simulator, you will be hard pressed to find accurate models for semiconductor devices. They are more useful for trying out different ideas rather than doing accurate predictions of actual performance.

From: dube@cpdvax.csc.ti.com (DUBE TODD)

The notion of encrytion of public communications is an oxymoron. In order for encryption to afford security, the method must be known only to a few who have a need to know; then it should be changed at irregular intervals.

Not true. Kerckhoff first enunciated several laws of cryptology, one of which is that the "enemy" is assumed to know the encryption system in use. Security must therefore reside entirely in the encryption key. If the key is non-random, or is used more than once, it is theoretically (but often not practically) possible to break the cipher. If the key meets the random and one-time tests, and is kept out of "enemy" hands, it is theoretically and practically impossible to break a cipher.

The idea that "the method must be known only to those who have a need to know" is popularly known as "security through obscurity". It doesn't work. The method can be discovered just as easily as the key, if the key is non-random or non-one-time. From a military point of view, you can't afford to throw away all of your cipher machines (or algorithms) just because the enemy gets his hands on one. See "The Codebreakers", by David Kahn, ca. 1966.

(In the interest of avoiding flames, I'm not addressing the issue of encrypting cellular phones, just correcting a common misconception.)

4711. Re: What about for us SWL's ? Re: Tuning dipoles and antennas.

Newsgroup: rec.ham-radio

Yes, the Beveridge antenna is very lossy due to its close proximity to ground. This is no big deal on receive, (since both signal and atmospheric noise are reduced the same amount, the S/N is hardly affected), but obviously IS a big deal on transmit.

The Beveridge does have a reputation as a low-noise antenna, but I suspect this may be due primarily to its low sensitivity. Its real advantage is directivity -- it reduces noise and interference coming from other than the preferred direction.

Where does it go?
Someone writes:
>AT LEAST get the *&^%*&%* SWL and monitoring stuff out of here! I
>mentioned this before. There now is a rec.radio.shortwave and yet

I just get Info-Hams Digest mailed to me because I don't have direct access to things like rec.radio.shortwave. What is it anyway? Where is it anyway? Who cares? I do!

I vote to keep the content just what it is now, SWL, Scanning and Flames. When did I get a vote anyway? :-) After all, those all are a part of my hamming.

If anyone cares to enlighten me (via E-mail or otherwise) on how this net functions, I'd be glad to learn how to not encourage pollution of Hamming with other radio stuff.

I just get Info-Hams Digest mailed to me because I don't have direct access to things like rec.radio.shortwave. What is it anyway? Where is it anyway? Who cares? I do!

I vote to keep the content just what it is now, SWL, Scanning and Flames. When did I get a vote anyway? :-) After all, those all are a part of my hamming.

If anyone cares to enlighten me (via E-mail or otherwise) on how this net functions, I'd be glad to learn how to not encourage pollution of Hamming with other radio stuff.

4717. Kenwood TS940 EPROM To Borrow?

Newsgroup: rec.ham-radio
Date: 1989-12-12 01:31:48 UTC
From: pff@thumper.bellcore.com
Message-ID: <1786@thumper.bellcore.com>
Source record: 14899
Cross-posted to: rec.ham-radio,rec.ham-radio.swap

This is a long shot, but...

Does anyone have the EPROM for the Kenwood interface that I could borrow for a few days?

And for all those wondering: Yes, I know you don't need an EPROM for the <<440>> (so I've been told :-)). But you <<DO>> for the 940 (ditto comment).

Please e-mail responses to:

pff@thumper.bellcore.com

Many Thanks,
Pete Ferris, N5KBD

=>Why do you think that the monitoring stuff should be in rec.radio.shortwave?
=>There are those who do one or the other and don't want anything to do with
=>the one they weren't interested in. By the NAME of the group, shortwave
=>listening goes there, but monitoring is still left out in the cold, and most
=>people still expect it to be HERE. So until someone gets off their other
=>end and sets up rec.radio.monitor I will continue to expect it to be here.

Phil, (and everyone else),

My understanding was that rec.radio.shortwave would be a place
for anyone interested in the monitoring hobbies to come for
discussion. There have already been several articles on jammers,
scanning, and broadcast band dxing there.

As a matter of fact when this was first discussed in news.groups
thename considered was rec.radio.monitoring. Because a number
of people felt that r.r.sw would be more descriptive for the
average usenetter, the name approved, (by vote), was r.r.sw.
However the charter allows the discussion of any monitoring topic.

Come on over......we would love to have you if you are interested in
these topics.

4719. Re: Modifiying radios for out of ba

Newsgroup: rec.ham-radio
Date: 1989-12-12 03:56:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500320@ux1.cso.uiuc.edu>
Source record: 14881

The original choice of 11 meters for CB was based on what could be made cheap at the time. UHF CB existed then, and exists now (GMRS) but has a totally different nature to it. GMRS is fairly active even around here. Back when 11 meter CB was starting up, though, UHF was difficult and expensive. Today even 800 Mhz is quite cheap.

I believe 11 meters never became, and in fact due it its shortwave nature, never could be, what CB should be. Were it not for the fact that the FCC doesn't even want to hear the words "cee-bee", I would suggest a CB system in the upper ends of 800 or 900 Mhz where the FCC still has some land mobile frequencies reserved.

Now of course if I could convice them to charge $100 for each term of a CB license in that service.... just dreaming.

4720. pudgy wound helical antenna (60m vertical in my living room!)

Newsgroup: rec.ham-radio
Date: 1989-12-12 07:14:35 UTC
From: ems@Apple.COM
Message-ID: <5731@internal.Apple.COM>
Source record: 14875
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Well, I finally did it. On my first day of vacation I built my
'pudgy wound' antenna. I did a vertical to start with. It is
48 INCHES tall and resonant on 31 meters. A loading coil makes it
resonant on 60 meters.

The details: 48 inches long, 4 inches in diameter, 48 turns of 20 ga.
wire (insulated hookup wire), about 1" between turns.
That's about 50 feet of wire. Turns spacing is not
critcal (at least not the way I wound it ...)

If I tap into turn #44 or #45 it is resonant on 31 meters. I have added
a 10 turn loading coil on the same form (close wound, same wire type) that
lowers resonance to the 60m band.

I used a 4 ft. piece of 4 inch diameter PVC pipe for the antenna and
coil form. (It is designed for 'leach lines' for septic tank systems.
There are two kinds, with holes and without. I used without holes.
Cost was about $5 for a 10 ft section) and regular hookup wire for
the antenna wire. The prototype just uses straping tape to hold the
turns in place. A finished version will use something more durable...

I learned that an 'antenna bridge' does what I wanted to do (find out
resonant frequency of a random object/antenna without a transmitter and
swr meter) plus it gives information on impedance. I bought one made
by MFJ for about $80 and it seems to work as advertized.

Performance? The 'Pudgy wound' (my name for fat short helixes) vertical
seems to be resonant over all of the 31 meter band. It does OK on 41m
but doesn't do real well on 25m. It also beats my reference antenna!
The impedance was about 150 ohms (I think, I used a single wire lead
and wasn't too careful about measuring the impedance of the antenna).

My house has a stucco finish (i.e. chicken wire in the walls ...) and
inside antennae don't usually do well. This antenna gave me my first
decent signals on 60 meters!

(Oh yeah, what is my reference antenna? Well, it's my window frame.
The MFJ antenna bridge reports it to be resonant from 49m all the way
through 31m and OK on 25m. It has an impedance of about 250 ohms. It
works startlingly well and I havn't been able to beat it with an inside
antenna until now... but that is another story/investigation.)

Well, on to the future. Next experiments will be to move it outdoors and
up to the roof top; then make a dipole version. (Hmmm maybe a 120
meter dipole in 20 feet?! After that, who knows. Maybe a 'Pudgy Yaggi'
for 31 meters? I may also try putting a pie tin on the top for a

capacitance hat and a ground plane/radials ...

The theory? Well, remember that I'm not an engineer, but if I understand the antenna books I've read (great leap of faith!) by increasing the diameter of the turns in the helix (making it 'pudgy') I have reduced the inductance. By bringing the turns closer together I have increased both the capacitance and the inductance (though I think I've had a net decrease in inductance). The net of the changes is that it has a slightly broader band of resonance than a long skinny helix and has a much shorter length! If there is a real engineer who can do the comparison of a 1.5" diameter 20 ft. helix vs. a 4" x 4ft. helix I would like to know what is really going on... (I suspect that the model degenerates into a straight wire at one extream { zero diameter helix} and a loop at the other {as in quads and full wave loops. one turn of a 'helix' with zero pitch} with a pudgy helix being closer to a loop in behavior than to a 1/4 wave wire.)

I havn't had alot of experience at evaluating antenna designs. If someone with more experience (and perhaps a transmitter and field strength meter) would like to test one of these out, it doesn't take much time to knock one together. I would love to know how it stacks up against a 'real' vertical or a 'real' dipole!

In the mean time, I'm rather tickled with my space saving antenna. I think it is an original variation on the helical wound antenna theme, but then again there is so little that hasn't been tried somewhere by someone... Please let me know if pudgy helicals are of any use to anyone. (or if I'm re-inventing the oil lamp in the electronic age ...)

> 1) The antenna/balun kit says DO NOT USE A TUNER. Why is this?
> Is it because you shouldn't have to, or because something evil
> will happen if you do?

There is no harm in using an antenna tuner, even if your antenna
already looks like 50 ohms. An antenna tuner is simply a matching
network that transforms arbitrary load (antenna + feedline) impedances
into 50 ohms, which is what your rig likes to see.

> 2) When I tune for low swr, I notice that the rf meter drops quite
> a bit. Is this normal? What does it means?

Your rf power meter is designed to read power delivered to a 50 ohm load.
Varying your tuner changes the load impedance seen by the meter. When
the load impedance is anything other than 50 ohms, you can consider
your power meter uncalibrated. Yes, the effect you are seeing is
normal, and the fact that your meter reading drops doesn't mean that
you are radiating less power.

> 3) The rf meter on the rig usally reads about 160. the forward
> on the tuner reads about 80. the reflected read 30.
> Where did the rest go? Is the likely just a case of meter
> mis-calibration, or does the meter on the rig actually show something
> other than true output from the rig??

There is a wide range in quality/accuracy found in amateur power meters.
The hf power meters that typically cover 160 through 10 meters often
give incorrect readings at the extremes of this range. Also, since
your swr is not 1:1, your 2 meters are not guaranteed to agree. I
wouldn't worry about the differences between them.

> Information concerning the above and/or anything that a novice should
> know about using tuners in general would be greatly appreciated.

Antenna tuners are useful in cases where the impedance of your antenna
system is significantly different from 50 ohms, so that your rig cannot
supply full power to the load. Most of the new solid state rigs cannot
tolerate too much excursion from 50 ohms before the output power starts
falling off. I can't remember now, but your T599 may be old enough
to actually have an adjustable pi-network in the output section, which
would give it a much greater range of antenna impedances that it can
work into.

4725. Encryption of Public Communications

Newsgroup: rec.ham-radio
Date: 1989-12-12 14:23:44 UTC
From: DEFRANCO@TOPS20.RADC.AF.MIL
Message-ID: <12549514807.14.DEFRANCO@TOPS20.RADC.AF.MIL>
Source record: 14914

Dube Todd recently suggested that knowledge of the timing of key changes in encryption systems makes "public" systems worthless indicates a lack of knowledge of modern systems. At least within the military, commercially produced systems are in place that receive periodic cryptographic updates ove standard telephone lines, and which establish a new transmission key for each session, based on a known algorithm for generating a key. Such a system would be ideal for cellular, although some work might be required to compensate for the initial setup times by the system.

In addition, if someone has really sensitive information (or really private) I would hope they don't expect either public airways or telephone wires to be really secure. Most of the new cryptographic algorithms have been reduced to hardware chips. Widespread use would significantly lower their cost.

From: Pete_Simpson@DGC.MCEO.DG.COM
Message-ID: <8912121555.AM00043@adam.DG.COM>
Source record: 14918

CEO summary:
In the January, 1990 issue of Popular Science (p.52), there's an
article entitled "Cellular Phone goes Digital". There have also been
one or two articles in EE Times which mention the "future digital
cellular phone system". It would appear that the ECPA prohibition
about listening to cellular phone calls is about to be rendered moot.
Of course, it's only a matter of time before some enterprising soul
figures out what the encoding and randomizing functions are and
develops the "-dec" part of the appropriate "codec" :-)
Although monitoring cordless phones is fun, (who, me???
Never!), don't sell cordless phone monitoring short. They have the
advantage of not "changing cells" just as the conversation gets
interesting! (A DTMF decoder and display lets you see what number the
person dialled, too...if they happen to be using tone dialling!)

Well, I hate to admit it, but I'm 34.5 years old. I received my first ticket on Dec. 7, 1987, though I had the opportunity back in 1974 or so. My brother, N5BZK (back then it was WB5SIH), just didn't press the issue enough. Also, he was running an FT101E in his mobile. I opted to avoid radios which outweighed me, back then. Today, I am looking for a radio to replace the FT101E I "inherited" along with the FR- and FL101 twins. They were sold to upgrade for the WARC bands upon receipt of my AA status.

I want to operate 160m as well as WARC. In Crockett, TX, is a 250' AM broadcast tower waiting for a good rig to attach. My father-in-law owns/operates KIVY AM/FM, and the AM side goes off-the-air for a clear-channel sister station every evening around sunset. Give me a transmatch and 100W and I'll be happy!!

Reply to Doug Datwyler's request to move onto "important" stuff:

I am of the opinion that scanning, swl, jammers, military communications and the politics and hooey associated with them are loosely related to ham radio and that the information is of wider value and interest than you might suspect. Persons interested in ham-radio are frequently also interested in other forms of radio. Those interested in other forms of radio might be prime candidates to become hams.

Having been a ham for over half my life now, (I'm 33 and been licensed for 18 years), I have a far wider interest in radiostuff than just the limits of my Extra privileges. Ham radio has served me well in many non-ham places (such as at our RFI test facility here at HP, on the bridge of Navy ships, in the radio rooms of submarines etc etc).

Politics is an inseparable part of ham radio. HR exists at the whim of Congress. Congresscritters are politically and monetarily motivated. If you want to ignore this aspect, you may find that there is no ham radio at all.

If you find this stuff intolerable, just tune past it. You don't have to copy it all.

> WB4HVD

According to the 1990 Old Farmer's Almanac, the Geminid meteor is occuring during the December 13-14 period, coinciding with a full moon (bad for observers, not too bad for meteor scatter VHF).

The Quadrantid meteor shower is the largest of them all (again, according to the OFA) and is on Jan 4th. The Lynid shower will occur in the late evening of April 20th/21st (evening of the 20th/ morning of the 21st). The Eta Aquarid shower will occur early morning around May 4th (before twilight). The Perseid shower should have as many as one meteor a minute, and will occur between the 11th and the 13th of August. The Orionid shower is expected between 3 and 5am (EST) on October 20th and 21st. November 16th, before dawn, the Leonid shower is predicted greater than usual.

Again, the source of all of this is the Old Farmer's Almanac, the only reference material for such things available to me right at this time. Its accuracy, for what I've used it for, has been very high, so I have little reason to question these dates.

>On lower frequencies, the ionosphere is a better reflector so the skip
>zone is smaller or non-existent.

Well, not exactly. The ionosphere doesn't really "reflect" radio waves; more properly, it "refracts" them - bending them back to Earth. The difference is subtle, and the action of the ionosphere may often be modelled by imagining it to be a perfect reflector at a specific altitude, but that isn't what really happens.

The other effect of the ionosphere that comes into play in considering how signals propagate is absorption. Higher-frequency signals are both refracted and absorbed less by the ionosphere, and are more likely, therefore, to make it through before being returned to the surface. Low-frequency signals are both absorbed and refracted more - they're easy to get "bounced back", but are more likely to be absorbed into the noise before you can get enough signal back to do any good. Due to these *two* effects, there is only a certain range of frequencies which are suitable for communication over a given path at a given time of day (plus other conditions affecting the strength/height of the various ionospheric layers). Above this range, the signals punch right through before they get back to the surface; below it, the signals are swallowed up in the noise. (Think - if it were just a matter of "reflection", you'd get AM broadcast band stations all over the country in mid-afternoon!)

What is the proper design modem for use with the new Microsats?
I've seen conflicting information in various circles...some people
are saying G3RUH 9600 baud modem...others G3RUH 1200 baud modem--
Anyone have the full story? I have not seen the G3RUH 1200 baud
modem advertised anywhere (I may not be looking in the right places,
RadioKit was one possibility)...

My understanding of the situation is this:
400 baud G3RUH PSK for telemetry
1200 baud G3RUH PSK for PACSAT or AO-13 voice transponder
9600 baud G3RUH FSK for UOSAT-D

Am I close?

A "resonated", "matched" antenna works best for SWLing. Note that I said
"resonated" not "resonant" antenna. A much misunderstood term called
"capture area" is important for receiving antennas. Basically this means
that you put up as much metal as you can as high as you can covering as
much area as you can. This will give you coupling with more of the incoming
wavefront and give you more RF at the antenna terminals to work with. You
resonate a monster like this by adding reactance of either inductive (+) or
capacitive (-) value in order to null out the reactance presented by the
antenna at the operating frequency. To "match" the antenna to the receiver,
you use a matching network to transform the impedance at the antenna
terminals to the 50 ohms required by most modern high grade receivers.
A device that can combine both of these functions in one box is called
a random wire tuner. To adjust it you simply tweak it for the loudest
signal at the frequency you're using. Simple no?

>I think they should be. Anybody know where?

I've never seen them on-net. In any case, the Blue Books (1988) are current, not that X.25 has changed much since the Red Books (1984). I suspect they're copyrighted by CCITT anyway.

And AX.25 has the following in common with X.25: the letter X and the digits 2 and 5. And a dot. (Sounds like Sesame Street!) Not much more. X.25 includes both a "Level 2" protocol (LAPB) and a "Level 3" protocol (PLP). AX.25 uses some of the procedures and some coding aspects (not all) of LAPB, and none of L3. ROSE is based more closely on X.25 L3.

Go with a 386 if you can afford it (Unix runs nicely on a 386). Go with a 286 system if the 386 breaks the budget. Only if you are below poverty level should you consider an XT system in today's clone market.

> 2) 5.25 inch floppy drive - 360K, 720K or 1.2M?
> (Are there any drives than can handle > 1 format? I'd

> with other people/systems; I already plan to install
> a 3.5 inch drive as well)

A 1.2M will read (and usually write) all the lower density formats. A 1.44M 3.5 inch drive will read and write all lower density formats. Please note that you may need a special controller or a special software driver or both to use high density drives on an XT.

> 3) Operating System - I know MS-DOS is the 'standard';
> what about Unix?

Unix runs best on a fast 386 with big harddisks, however, that said, Unix will run quite nicely on a 16Mhz 386 with a modest (80M) hard disk. Running Unix on a 286 is possible, and I know people that do, but not highly recomended.

>example, is it possible to have a TNC setup running 'background' while doing
>something else with the PC, like playing Adventure? :-)
>

The short answer is yes. There is a TSR driver for the DRSI packet adapter, and of course under Unix there is no problem (especially if you have VPIX--a DOS emulator for Unix).

The latest in the continuing saga of the Yaesu FT-470 dual bander HT:

I spoke to an engineer at Yaesu (in Cerritos, CA.) about the only problem I have with the HT - intermod in RF hot areas here in Orange county, CA. - and he explained to me that the receiver is so hot (this appears to be true when comparing to other HT's I own) that some intermod is unavoidable if you use a gain antenna and are in a hot area.

Of course, I would like to have an attenuator for the receiver built in to the rig to take care of such problems, anyone out there ever attempt such a thing? Looks like Kenwood put one into their dual band HT, (but the specs for recieve sensitivity are not the same), does this help you Kenwood users?

As I have said before, I would buy the Yaesu instead of the Icom and the Kenwood again because of the size and better feature set. (But the new mini icom dual bander is one to watch?) I have experienced some intermod on the Icom in the same areas of CA, although it is not quite as bad.

Again, if you plan to buy a dual band HT, try each one carefully and in your own time if possible, then make the choice that is best for you.

Gentlemen and Ladies:

Encryption of cellular phones does not have to be complex. Neither does it have to be unbreakable. Even a simple, easily breakable scheme would solve the problems of the ECPA. My reasoning is this. The indended purpose of the ECPA was to protect the privacy of cell-phone users. The ECPA chose to do that by saying "you can't listen to them." If a encryption/digital coding system were to be used, however simple, to make the voice unintelligible to the "casual" listener, then the purpose of the EPCA will have been achieved. The person who takes the "extra step" to decode these transmissions is easily seen as having "criminal intent". And of course, none of US will do that. Make the penalties for decoding the transmissions the same as for an illegal wiretap. It in effect does the same thing. This idea, of course, is Santayannaish and unenforceable, but it does solve the problem without the dangerous precedent of the FCC being able to decide what we can and cannot listen to.

Related to that...can anybody tell me of a valid reason to listen to the cell-phone stuff anyway outside of sheer Mrs Grundyism (Mrs Grundyism = the uncontrollable urge to mind other people's buisness....)? Does it have any public service function? 90% of the stuff is utterly boring anyway, or so I would assume from my own use of the telephone....

As for this list being out of control.... I say keep it wild and wooly. Yes, a lot of this stuff is not Ham Radio, per se, but the cross postings let us see beyond the scope of our own hobby.

As for the responses I have gotten about building radios from scratch, thanks. The ones I have gotten so far have been of high quality. Keep 'em coming.

And finally...I'll be leaving for Christmass break in a few days. May all of you have a happy holiday.
All I want for Christmas is my ticket! (being processed as we speak)
Who does the FCC hire in Gettysburg, anyway! (sorry. a little flame here...)

>I have so far are: 1) XT vs. AT vs. 286/386 - which is best?

Get a 386 if you can afford it; otherwise get a AT/286 if you can afford it, otherwise get a XT.

> 2) 5.25 inch floppy drive - 360K, 720K or 1.2M?

360k and 1.2M disks are 5+1/4". 720k and 1.44M disks are 3.5". The 1.2M drives can read and write to the 360k disks. The 1.44M drives can read and write to the 720k disks.

The 3.5" media is very expensive. The 1.2M disks are the most cost effective media (bits/$).

BEWARE: the high density drives (1.2M & 1.44M) have a narrower gap on the read/write head. This means that if you write to a disk with the lower density drive, then write to it with a high density drive, you may have problems reading it on a low density drive. This is because the previous data written with a low density drive will still be on the disk, and will effectively be noise.

> 3) Operating System - I know MS-DOS is the 'standard';
> what about Unix?

There are lots of programs that will run under the MSDOS system. I would recommend having at least one MSDOS system around, even though the operating system (MSDOS) has serious deficiencies.

It is very difficult to do this if you don't run a multitasking OS. DESQview seems to do a reasonable job for the money, however.

OK, what are some examples of a "random wire tuner" that one can go out
and buy?

I observe that Heath, MFJ and others have some "two knob" antenna tuners
good for maybe 200 watts that might make sense for receive only use,
however only the "three knob" ones seem to offer "inputs for random wire",
but then the "third knob" is nominally for tuning connection to the
"transmitter", which should be non-critical for recieve only operation.

Anyhow, are either of these devices appropriate, or is it something else
again that one needs...

In the US callbook, do the publishers of the callbook have to get your permission to include your call? Or do the FCC give/sell the calls database to the callbook publishers? Is there any way of guaranteeing non-inclusion in the callbook?
The DTI (British equivalent of FCC) have a 'non-disclosure' box on the license application form - if you mark the box, they keep your call and address out of the 'published' list of calls.
Call me paranoid, but i dont want my address listed in lists! My home phone is ex-directory too (keeps the tele-sales people offering timeshare apartments away from me!)

Not as ridiculous as it sounds, given the rubber-stamp 59 that everyone gives in the contests. The same question was asked of me in the 160M contest a couple of weeks ago by a W4, and that was on CW.

> Chuq Von Rospach <+> chuq@apple.com <+> [This is myself speaking]

NO! NO! NO!
Rec.radio.shortwave was created to keep the noise level down or at least
within a specific spectrum. Create a rec.radio.scanner if you want, I'd
certainly vote a resounding yes, but we do not want our (shortwave)
bandwidth chocked full scanner stuff, please. Most of us don't have the
time to hit the ignore-article key too many times per day, and keeping
things segregated helps a lot.

If you want to continue reading the things in the ham group, that's
why it's here.

> 9600 baud G3RUH FSK for UOSAT-D
>
> Am I close?
>

Close but NOT complete. What is AO-13 voice? In the U.S. there is available a 1200 BPS modem from TAPR, Inc. Tuscon, Az. It is decidely superior to the G3RUH PSK modem BUT (1) it costs more, (2) it is harder to build though not ridiculously so, (3) the gain in BER over the G3RUH modem will not be needed if you are already using directional antennas. If you wish to be able to copy Microsats with an omni antenna with an acceptable bit error rate (BER) then the G3RUH is not the way to go. James is a good friend of mine, he has done an outstanding job in bringing a low cost modem to market for the masses but he took shortcuts that make its performance about 10 dB worse than the TAPR/W3IWI version. They are (1) He used a squaring loop (more on that in a moment before you jump on me) (2) HE HARD LIMITED THE SIGNAL AS IT `COMES IN THE DOOR'. This latter lost him several dB but it made analog conditioning of the signal a breeze, there is NONE ;-). It is a bit harder to implement a good squaring loop than it is a Costas loop even though they are THEORETICALLY equivalent and the Costas takes more parts (and thus costs more). The bottom line is he was there first with a commercially available modem, it was and is cheap but it has a 10 dB implementation loss over the TAPR version for much less than a 10 dB increase in cost.

The hands down winner for copying and talking to UOSAT D is the G3RUH modem. He has done an outstanding job on that modem. No short cuts their and it is a winner. He has hundreds of those operating in the field and they are copying 9600 bps FSK now which is what UOSAT D uses as you mention.

There are new alternatives to the 400 bps, 1200 bps stuff coming out from Paccomm (also the source for the 9600 G3RUH in the states). It was announced in the AMSAT Journal. It does both in the same box. Call them for details.

The Microsat will operate 4800 bps PSK. There is but ONE modem that does this at present. That is the soon to be released DSP-232. A DSP based modem that will be coming soon to a dealer near you from AEA. It does all the modems you have mentioned above and more.

I hope this doesn't sound to self serving since I designed it, just trying to keep you informed and you did ask ;-).

> than works with Quiktrak or the new Instant-Track... and preferablly
> runs by itself without using the host CPU. Any one have any
> comments on this?

Yes I have comments on that as well. You are asking great questions
especially from my point of view ;-). I wrote Quiktrak. Brooks and
I designed the software interface for the Kansas City tracker and
it is a plug in card for the PC BUT from the `between the lines'
of your question, I don't think you understand how it works. Forgive
me if I am wrong and ignore what follows. It does use the CPU but
IT DOES NOT PREVENT YOU FROM USING THE CPU TO DO OTHER JOBS WHILE IT
ROTATES THE ANTENNAS! That was the purpose of the entire design,
hardware and software. It is fired up on the timer interrupt in your
PC, the interface is a TSR (termintate and stay resident driver).
Quiktrak loads a table and lets you quit quiktrak and go edit, run
your terminal program, etc. while IN THE BACKGROUND in updates the
antennas. He has a small accessory that adds onto the board which
will also tune your radios from the input from Quiktrak. Instanttrack,
the now and latest WOW available from the AMSAT software exchange has
supplanted my Quiktrak as the `latest and greatest' piece of tracking
software. Their approach is slightly different. They do not load
the table BUT they have their own TSR which fires up on the timer
interrupt and computes an AZ/EL point and then shoots it off to
the Kansas city tracker interface. They cannot at this time support
the automatic tuning of the radios but I understand and hope that
they will in the near future. If you object to leaving your computer
on in any way or if you don't own a PC compatible, then forgive my
comments. I thought there might be others who were interested in
the details.

At a hamfest last year, I found a bargain power supply which needed just a little repair work. Now I know why it was so cheap! I need to replace some 2SD845 power transistors in it. Unfortunately this device and its replacements are no longer manufactured and I can't find anything to substitute which will fit the heat sink and circuit board (without major surgery).

Here is my list of possible substitutions:

Number Pd(W) Ic(A) Manuf
2SD845 120 12 Toshiba (original part)
2SC2562 150 15 Toshiba
2SC2921 150 15 Sanken
2SD745 120 10 Nippon
2SD852 100 15 Nippon
2SC2650 100 10 Toshiba
2SD851 80 10 Nippon

If anyone knows where I can find about 4 of one of these, please let me know.

Note: the Norton SI rating is notoriously poor as an indicator of a PC's
speed (but unfortunately there IS no widely accepted, GOOD benchmark).

>
> SoftPC only runs on Mac II, IIx, IIcx and IIci at this time, however, Insignia
> Solutions (the maker of SoftPC) promises support for the SE and Portable in
> a couple of months.
>

The SoftPC costs $595. and requires 2MB of RAM and a hardisk
with at least 3MB of available free space. On a Mac II it runs
at PC/XT speeds; an SE would probably require an accelerator
card to run even that fast.

COMMENTS: For $595. you could BUY the actual PC hardware rather than
simulate it on a MAC. Furthermore, SoftPC requires some
rather expensive MAC hardware!

Modems, ports cards, IEEE-488 interface, A/D and D/A data
acquisition and control, printers, plotters: these are all
now available for MACs, but at MUCH higher prices than for
PCs (try pricing a MAC parallel port card sometime!). PC
accelerator cards are also relatively cheap, should you
want performance significantly better than XT level.

Of course, if you're primarily MAC oriented, already own
most or all of the required hardware, don't want to add
any PC hardware, find XT performance adequate, and don't
want another computer cluttering your workspace then
SoftPC might be a good solution. In any case it does
represent a 'tour de force' of the MAC's capabilities.

IMHO there are more fanatics in the MAC camp than in the
PC camp, for some reason (NO, I am NOT accusing or suggesting
that Mike Chepponis is a fanatic: his posting provided useful
info). MACs are very nice for some uses and some users
(although there are a few things PCs are better for, such
as low level hardware hacking).

For me, the bottom line counts: PCs are cheaper and, for most tasks, the PC is adequate (a lot of application software runs about the same on either machine). That is, some of us would just as soon use a Chevy (Hyundai?) a as Porsche: the Porsche is more fun to drive but either vehicle will get you to work, and who wants to pay $40K+ for a car?

Below follows the call for votes for rec.radio.shortwave, which as you
will see specifically includes scanners, and any other radio receiving
and monitoring, possibly including even TV!

In article <4170@amelia.nas.nasa.gov> chguest@pioneer.arc.nasa.gov (Charles J. Guest)
writes:
>(Does anyone out there have a copy of the orig. charter they can send
>me?).

Here's the first part of the "call for votes":

This is a formal call for votes for the proposed group
REC.RADIO.SHORTWAVE (originally rec.swl).

Purpose: to discuss all issues of interest to short wave listeners,
i.e. those who are interested in listening to programs on the
shortwave broadcast bands. Topics will include, but not be limited to,

program schedules, program recommendations, receiver reviews, dx news,
the politics of international broadcasting, information about
periodicals of interest, tips for improved reception, pirate and
clandestine station information, etc.

This group will also welcome articles on dx'ing other broadcast bands
(lw, mw, vhf-fm & tv), and on shortwave listening of non-broadcast
stations.

It is expected that this newsgroup will be gateway'd to the swl-l
mailing list (though a few details remain to be worked out).
[yeah, well, it's halfway working...]

Voting procedure:
[etc]

If you feel that rec.radio.shortwave should prohibit scanner
information, then either hold a vote in rec.radio.shortwave to see how
the majority feels, or hold a vote to create rec.radio.scanners so
that such traffic can move out of rec.radio.shortwave. I have no
objection to moving that traffic out of rec.radio.shortwave; I only
object to scanner enthusiasts being left without ANY newsgroup.

Mark

A while back a chap asked if anybody had set up an emergency van for field operations with amateur radio equipment. I posted a reply to this posting, but due to an anomaly in our news software, the posting never made it to any other sites.

The Santa Barbara Amateur Radio Club has had such a van for about 5 years or so. The last time I visited them, it was crammed full of radios, packet gear, an emergency generator, a crank-up tower, and all sorts of other equipment. The van was donated by the Santa Barbara Research Center of Hughs, and quite of bit of custom cabinetry, wiring, mechanic-ing and so on was done to make it an excellent operating station. I was impressed. It is one of those large step-van type vehicles, tall enough to walk around in. I think they even have a coffee pot installed.

Regarding meteor showers...

There are several sources of information about VHF
meteor scatter (or, if you prefer, meteor burst).
If you are interested in how/when/why - type
information, you might check out QST, June, 1986.
If all you want to do is work 2m DX, try the ARRL
Operating Manual.

BTW, the Quadrantids is NOT the biggest of them all,
and in fact it's very easy to miss because its peak is so
narrow. The Geminids (just past) are reasonably abundant but
they are slow and consequently not too hot for DX.
The Eta Aquarids, Perseids, and Orionids are by far the better
showers for 2m & up VHF DX.

QRZed meteors ...

What (zulu) time are you referring to? I worked the pacific (3D2XR on Rotuma) easily last night at 0450Z. I wish the polar path were better on 15, have heard XW8CW several times but he's too weak to work.

We have been having some solar disturbances lately, that might have something to do with it.

What time are you referring to? I had no trouble working 3D2XR last night at 0450Z. Also heard a couple of VK's.

We've been having some solar disturbances lately (witness the poor openings on 15 lately to Asiatic Russia). Maybe that accounts for some of it.

>
> Does anyone have any ideas/pointers on quieting down telephone
> interference?

Below are some extracts from an article I wrote a couple of years ago for Popular Communications Magazine. The Issue was Feb 1988, if you want to see the whole thing.

TELEPHONE INTERFERENCE

(CAUSES AND CURES)

There is some hope when it comes to interference. The FCC has issued a field bulletin on RFI. The document is called "Bulletin FO-10, Telephone Interference". Copies of it can be obtained from any FCC field office. Find your nearest FCC office by looking up FCC in the phone book. The Bell System has considered the problem and approach it from the viewpoint of interference to regular 500 and 2500 type phone sets. The Bell document concerning RFI is known as a Bell Systems Practice (BSP). The document is BSP Section 500-150-100.

Before you tear things apart and spend money, there are a few things to check. These checks can be done with an adjustable wrench and a screwdriver. What is checked is anything on the line itself that could be acting as an antenna or detector. A dirty connection can work as a diode to detect RF signals. Go over the internal wiring looking for the following:

1. Corroded connections. Clean and tighten.

2. Loose wire terminations, including set wiring and all jacks and junction boxes. Tighten any loose screws.

3. Abandoned wire still connected to the line. Remove any wire not connected to a working phone.

4. Old unused devices still connected to the line. Remove abandoned phone answering machines, old telephones and bells etc.

If any of the above is what is causing the RFI, until you fix them, there is little hope that anything else you do will cure the problem.

The other legal "do it yourself" fix is attachment of toroid cores. These cores look like small black doughnuts, by

wrapping wire round a ferrite core a simple effective RF filter or choke can be made. Ferrite cores are frequency selective, by the choice of the right material, interference can be effectively hit on the head.

With modern phones, the most RF sensitive part of the phone is the electret microphone and its preamplifier circuit. By application of ferrite cores to the handset cord, there is a fair chance of easily and cheaply fixing the problem. If you are hearing radio signals on the phone, there is a way of checking if the microphone/handset cord is to blame. Dial a partial number to give you silence, listen for the interfering signals and grab the handset cord. If the signal changes in volume - gets better or worse - try a ferrite core.

The best source of ferrite cores in small quantities is Amidon Associates, 12033 Otsego street, North Hollywood, California 91607. PHONE: (818) 760-4429. Amidon Associates have several ferrite "mixes" available. For interference from 500 Khz to 10 Mhz, i.e. AM broadcast RFI, they recommend their 75 material. For interference from 1 to 30 Mhz they recommend their 73 material. The 73 material should take care of all short wave Ham and CB interference. For low VHF and channel 2-7 RFI you can try a ferrite core made with the 43 material which should take care of RFI between 1 and 70MHz. For best results use the material that has the lowest cutoff point for your problem. If the local AM transmitter at 1070 KHz is your problem, use the 75 material, it will give much better attenuation at that frequency than the 73 material.

For a handset cord, a half inch core is ideal. Wrap four or five turns of the handset cord through the core and plug it back into the handset. The cord can be held in place with black vinyl tape or glue, hot melt glue works well. Experiment with the positioning of the core. Often having the core by the handset works best, other times plugging in the cord with the core by the body of the phone is better. Sometimes a core at each end of the cord is needed to do the trick. The cores may look kinda clunky, but if they provide relief easily and cheaply, who are you to complain.

The numbers for the half inch cores are: FT-50A-75, FT-50A-73 and FT-50A-43. Yes you guessed it - the last two digits tell you the material being used. For one and a half inch cores used with line cords explained below, the numbers are: FT-140-75. The last two digits being the same as for the half inch cores.

For RFI that you suspect to be entering via the phone line, wrapping the line cord round a large core can help. Usually it is best to place the core at the telephone end of the line cord. Though like all RFI cures, experimentation, otherwise known as "suck it and see", does a better job than hard and fast rules.

With the large core on the line cord, between six and twenty turns on the cord should do the trick. A core on each end of the line cord may help in stubborn cases.

For authorized phone repair stations, telephone personnel and those willing to risk "Open circuit surgery", there are several solutions. Using ferrite cores, twenty turns or so of scrap 24 Gauge telephone wire can be wrapped round a half inch ferrite core. Use two cores, one for Tip and one for Ring and place them inside the phone. The same kind of cores and windings can also be used, inside the phone, on the transmitter (microphone) leads.

For those really handy with a smoking soldering iron there are some more fixes to try. For phones using electret microphones, some well placed capacitors may do the trick. Try a 0.01 uF (10 NF) across the electret element. If that doesn't work try the same value of cap across the hot side of the element to the "ground" of the pc board. Regular phones with carbon transmitters can be helped with a 0.01 or 0.1 uF capacitor across the element. Solder the capacitor across the contact fingers in the handset, not across the element, so if the transmitter is changed, the RF proofing will stay with the phone. Also, inside the phone, a 0.1 uF (100 NF) 250V capacitor across Tip and Ring can be helpful. The type of capacitor to use is a Ceramic or Mylar.

For those with access to AT&T parts or wishing to help the local phone company, there are a couple of bits of helpful hardware mentioned in Bell Systems Practice 500-150-100. First there is a coil that should be spliced into the phone line. It is called a 1542A inductor. It should be spliced into the line as near as the offending telephone set as possible. This means put it right before the modular jack. It has six terminals, two for Tip, two for Ring and two for a ground, should the phone still need a ground (yellow wire) for the ringer or party line. The ground terminals are not in any way connected to the coil, so bringing a ground to the inductor, unless needed in the phone, will not help cure any RFI.

The Bell document also mentions a capacitor, designated a 40BA capacitor. It is actually four capacitors (see Fig 1) and the intent is to place a capacitor between each leg of the phone line and ground. The 40BA is usually installed at the telephone protector. There is always a good ground available at the protector, often a heavy gauge solid, solid gray jacketed wire. Those telephone personnel who do not have access to a 40BA capacitor should find that a couple of 0.1 uF 250V Mylar capacitors will work just as well (see Fig 2). To install the 40BA or 0.1uF capacitors, find the protector. The protector is usually outside the building in a wall mounted small box, in the

basement or in a closet for businesses and apartment buildings. If the phone line comes in on overhead cable, the protector will be in the first box the cable goes to after entering the premises.

That should be some help in beating the problem. Don't forget that some types of phones are more sensitive than others. Some cases may be so severe that nothing helps. AT&T no longer have RFI proofed phones available, although an old style desk phone with some capacitors added will be pretty immune to RFI. Alas AT&T no longer makes old style 500 and 2500 desk sets, although they sell reconditioned ones. Several manufacturers such as ITT, Comdial, and Northern Telecom still make old style phones.

END

This article appeared on Page 56 of the Feb 1988 edition of Popular Communications Magazine.

Source record: 14802

I am trying to use a Kenwood TH215 hand held TCVR as a start out rig on packet radio. However, I am not able to get the PTT on it to work with the external connections. I have followed the standard connections for wiring the input to the external mic connector.

I have unfortunately misplaced my manual and right now am helpless!! I would appreciate it if someone could give me the correct connections so that I could connect to a TNC and packet away.

Thanks

Two comments:
1. This would also be applicable to rec.auto
2. There is already a discussion in rec.auto which relates to the
possible creation of rec.driving, which would make rec.speeding unnecessary.

Yeah, right. Just remember that if you dare to remind anyone of the facts that surround the 7.1-7.3MHz area that they will brand you as some kind of a net.looney. Especially if you happen to know more about it than some dweeb who's an officer in their SWL club!

For those of you that may have missed it, I'm still waiting to hear from ole-whatshisname, the executive-VP who thinks that 40 meters should be taken away from Hams and given to the broadcasters exclusivly..I dared him to prove my points wrong or apologise. A small number of assistant-dweebs heeded him to ignore the challenge - if he does just that it will prove my point about such people: THEY ARE ALL TALK AND KNOW NOTHING!

I had the nerve to tell a story about a neighbor of mine (who wound up in jail for being an idiot and trying to tear down my antenna!) who seemed to think his rights to listen to foreign broadcasts in the 7.1-7.3 area were of greater importance than my rights to transmit there. Well, it ain't so..it never was and the history of '200 Meters and Down' is fairly lost on a large portion of the vocal ones on .shortwave. I SURMISE THEY CANNOT READ BOOKS, they only read the 'Net and their club newsletters!

So fellow Hams, beware! Some of the inhabitants of rec.radio.shortwave are not only way-ignorant of radio history/laws/etc...they are quite ANTI-HAM!

In short, the 'invite' does not apply to everyone..only those that will either _be quiet!_, or tolerate abuse..neither of which appeals to me.

(and you spineless wimps that have advised me to "be nicer to avoid flames" can kiss my ass! Such pansy-tactics are unnecessary, the guy had it comming! And besides..I'm right in this case..go look it up!)

arrl/e14

THE PLOT THICKENS

Enter, the A-R-R-L.....

REF: Sleezy Slander from: J E Kasser, G3ZCZ
Ramot, 96
Jerusalem, Israel

To wit:

>A rabidly anti-semitic net has been established by Jack
Schmidling NR9Q, which meets Thursdays at 9pm on 3950kHz
and daily at 10am on 14313kHz. The group calls itself "The
Amateur Radio Forum". Opinions expressed include alleged
Jewish control of Congress and the media, the idea that the
holocast is a fiction, the notion that the U.S. should cut
aid to Israel and other classical anti-semitic canards.

>Schmidling also is on the USENET computer link.

>Chaverim should resist the temptation to check into the net
and argue. Please turn your VOX off and monitor. If
possible, please record. It is perfectly legal for the hams
to express anti-semitic opinions, but any data that may be
useful should be shared with the Anti-Defamation League of
B'nai Brith. Also, keep an eye out for behaviour which
crosses the line of legality, e.g. profanity, infrequent
identification, or threats. Watch out for statements which
may be legally actionable such as malicious libel.

It turns out that Mr Kasser is not in Israel but resides in
the USA. His address is Box 3419, Silver Springs, MD 20901.
Phone is 301 593 6136.

In response to my phone call, Mr Kasser claims that he is
not the author but posted the malicious libel for someone
who wishes to remain annonymous. He also said he posted it
without making any attempt to verify the truth of the
content.

What is most interesting is that in pressing Mr Kasser for
the author's identity, he reluctantly admitted that the
author is a board member of the ARRL (American Radio Relay

League).

I find it most interesting that the self-proclaimed, defender of amateur radio, is using our medium for racist hate-mongering. But what is most dispicable is that the ARRL is using innocent third parties to annonymously promulgate their views. If Mr Kasser persists in protecting the author's annonymity, he will be caught in the legal hassle that will ensue unless he posts a retraction as I suggested.

Before renewing your dues to the ARRL, don't forget to ask them their view on shooting Palestinian children for throwing stones.

.....

If you have had it with people who try to cram their views down the throats of American Taxpayers, e-mail to arf and I will send you info on how to do something about it. NOW!

Of course that's a special case of RS(T) report, the "contest RST".
The N3 obviously knew it was. The KH6 did, too.

Maybe we can get the contest rules to make US hams give contact number.

Didn't receivers used to have a front-end tuned circuit that somewhat closely tracked the frequency you were tuned to so that intermod (and probably more importantly at the time) image rejection could be done? I know I saw an AM radio construction circuit one time where there was a front end. You had to have it if converting to 455 khz I.F. on such a wide band. Why can't today's receivers use the same "technology"?

^^^^^^^^^^^^^^^ ^^^^^^^^^^^^^^^^^^^^^^^^

seen by WHO ????

speak for yourself. Having written more than one decryption program (as well
as encryption), such things now are as easy as plugging in a demodulator. Its
not the "extra step" you claim it to be. When other public services go with
simple encryption, most scanner/monitor types will be decrypting. Only if they
make it really TOUGH will they knock people out of the hobby.

> penalties for decoding the transmissions the same as for an illegal wiretap.
> It in effect does the same thing. This idea, of course, is Santayannaish and
> unenforceable, but it does solve the problem without the dangerous precedent of
> the FCC being able to decide what we can and cannot listen to.

The better route is just to use a good enough algorithm that, w/o the key, I
cannot decrypt, and just keep the keys secure. Then and ONLY THEN will you
have a "reasonable expectation of privacy".

> Related to that...can anybody tell me of a valid reason to listen to
> the cell-phone stuff anyway outside of sheer Mrs Grundyism (Mrs Grundyism = the

> would assume from my own use of the telephone....

Can anyone tell me a valid reason for listening to LOUD HEAVY METAL MUSIC?
Why not outlaw that, since it serves "no useful purpose".

Come on, get REAL... the issue is not WHY people do what they do. Validity
should not be based on WHY... ever.

> All I want for Christmas is my ticket! (being processed as we speak)
> Who does the FCC hire in Gettysburg, anyway! (sorry. a little flame here...)

Not very many people.

Gee, Peter, the reason seems pretty obvious to those of us who've
tried both machines. :-) As a friend of mine (who teaches both
PC and Macintosh computer classes) puts it: "People tolerate their
PCs, but they love their Macintoshes!"

> For me, the bottom line counts: PCs are cheaper and, for most tasks,
> the PC is adequate (a lot of application software runs about the same
> on either machine). That is, some of us would just as soon use a Chevy
> (Hyundai?) a as Porsche: the Porsche is more fun to drive but either
> vehicle will get you to work, and who wants to pay $40K+ for a car?

Yes, I think the financial reason is certainly the deciding factor for
(most?) people.

Anyway, that's a never-ending religious issue, so to digress back
to ham radio :-) ....

I just mailed out the last of this year's FO0FB cards, so if any of you
are waiting for them, stay close to your mailboxes. Please note that I am
not the regular QSL manager; Ross typically does his own cards. I was
just helping out because he and his family have been so busy dealing
with putting their house back together after the quake.

73,
Patty
(who now owns a Porsche as well as a Macintosh. Guess I believe the
journey is the reward both on my desk and on the road. :-) :-))

From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <14.Dec.89.10
Source record: 14790

One thing to remember about receive antennas is that in most cases, absolute signal-gathering ability can be traded off against QRM elimination. Certainly on the HF bands, any discrimination between the wanted signal and QRM is worthwhile. If you can do anything with the antenna that reduces QRM by, say, 20dB but, at the same time reduces the wanted signal by less than 20dB, then readability will improve.
I have used a small loop on 80 and 160 meters for receive - great for nulling out the various radio nasties with which we share our bands.
Many years ago, the ARRL handbook had a reference to a system whereby you used two antennas, one that received the intended signal, and another that received the highest level of QRM possible. A network of variable capacitors allowed out-of-phase QRM to be added in controlled ways to 'null out' the QRM. I have never tried it myself, but know that the same technique is used in some military applications.

++Pete

And of course UHF radios can be modified to cover 420-440 Mhz. Unfortunately that also opens up the public service bands, so the dealers have decided that you need to have a MARS license for the mods info (what a bunch of B.S. !!).

> data-allowable sub-allocations? BTW, her freqs are 461.4/466.4MHz.

Those frequencies are not allocated for "telemetry" use by the FCC. However
it is not clear to me yet that this means data. There are lots of frequencies
that are, and most are rather wideband and above 800 Mhz.

Still, I'm curious why data is interference when voice is not. That would
depend on the spectra of the signal during transmission of data, the baud
rate, etc. See if you can actually hear the interference mentioned, and find
out what frequency is being interefered.

>73 Gary KE4ZV

Would someone mind emailing me their recommendation for a good antenna tuner and why they think it is better than some other one? Also, which ones, if any should be avoided. This is for swl'ing ... after 15 years absence, I think I will start back up again. I never used one in the past, but always got that feeling in the pit of my stomach that I was missing countries that others were getting.

Will the tuners work with dipoles as well, or are they mainly suited for long-wires?

Question about grounding: Just about every antenna-making tutorial says to ground to a water-pipe ("no, not the plastic pipe kind") or similar. If a receiver is powered through a 3-conductor power cord, would the antenna braid/shield (in coax,e.g.) automatically be connected to a "good" ground, assuming that the house electrical wiring is properly installed? Doesn't the chassis frame give you pretty much the same thing, since the ground wire in the home wiring goes back to ground anyway at the breaker box/service drop?

From: ka2czu@cbnewsh.ATT.COM
Message-ID: <6612@cbnewsh.ATT.COM>
Source record: 14818

From article <18230011@hpfcdj.HP.COM>, by myers@hpfcdj.HP.COM (Bob Myers):
> are more likely to be absorbed into the noise before you can get enough
> signal back to do any good. Due to these *two* effects, there is only a
> certain range of frequencies which are suitable for communication over a
> given path at a given time of day (plus other conditions affecting the
> strength/height of the various ionospheric layers). Above this range,
> the signals punch right through before they get back to the surface; below it,
> of "reflection", you'd get AM broadcast band stations all over the country
> in mid-afternoon!)

One additional fact which should be remembered is that ground wave
communication is much more effective at low and very low frequencies.
If you do some reading, you'll find that the "experts" thought no
long distance communication was possible above a certain frequency.
One of the factors that led "them" to this conclusion was the attenuation
of ground waves at higher frequencies.

At any rate, the improved ground waves is another reason why you don't
notice the skip zone at broadcast frequencies, even with the high
day-time absorbtion, which was pointed out.

4785. Re: CoCo WEFAX

Newsgroup: rec.ham-radio
Date: 1989-12-14 15:00:15 UTC
From: newsman@cbnewsj.ATT.COM
Message-ID: <2844@cbnewsj.ATT.COM>
Source record: 14819

Mike,
I'm sorry I have to communicate with you this way, but the machine I'm on does not seem to have a link to either of your E-mail addressses.

Mike I received the WEFAX program this morning via E-mail. I have one problem though. It seems the machine that I'm on does not have access to listserv so I'm not able to down load that "cut program". Are there any alternatives to decodeing WEFAX 105? If you have a copy could you send it to me? Also, I have a color computer II without a diskdrive or joystick. You mentioned that a diskdrive was not necessary if you did not plan on saving the pictures. How do you receive the pictures if you don't have a disk drive to run the program on? Is the program only necessary for saving the pictures? Is the cable that is needed available at Radio Shack? If not is it difficult to build one? Thanks for your time and patience.

Source record: 14733

I haven't really done much DX, but this weekend I got ``involved''
in the 10m contest and ran into a few DX stations. I've scrounged
through the last couple of years of QSTs to try to find the appropriate
QSL managers, with mixed success. Could someone help me out with
a couple of these?

1) The 4/88 QST says that KD2EU is the manager for V31MZ.
Is this current?

2) Do VP2EXX and JA6WFM/HR2 have managers?

3) Where SHOULD I be looking to answer these questions myself?!

Thanks in advance. It is amazing what 100 watts and a whip can do...

Until a week or so ago, 20 Meters has been open to the South Pacific every night around 0400Z. Lately, that path has been dead, though I hear stations further south working stations I can't hear. Perhaps it's just the winter solstice doldrums. Or maybe for some reason the D layer absorbtion is very high along that path lately.

Taken to the extreme: the K1EA contest program (which is a lovely piece of software, and the following comment is not intended as a criticism) *automatically* fills in 599 or 59 as the exchange for every station you work in a contest. The issue here is speed, and frankly exchanges can almost be done away with since once you've got a person's call, you've made a contact. You need the exchange to get the multipliers (states, countries, zones, or whatever), but the signal report is really superfluous. In fact, Sweepstakes manages just fine without an RST. Perhaps other contests should follow suit??

Hi,

I became a Ham in April of 88, and jumping into this with both feet (VHF, UHF, HF, packet, etc...) was putting quite a dent in my checkbook. This is one of the reasons I settled on the 140. Out of all the purchases during that time, the 140 was by far the best. It's really nice when you buy a product and you wind up with more features than you expected.

One of the nicest features that I leveraged off of (while getting over "mic-fright") was the 10 memories reserved for "band-spreads". In these memories you program in two frequencies: a low end and a high end. While operating in these tunable memories, if you "roll off" the top end, it loops you back to the low end. As long as you're in this memory, your legal. So far, I haven't found this feature on any other rig (though it is not something I've researched).

I work mostly CW and have no problem getting out a good 100 watts. I have worked several other 140 owners and have not heard any bad comments about the rig. In addition to CW, I also have it connected to a PK-232 and do RTTY and PACKET. I'm having a little RF feedback causing me some PACKET problems, but I have to do a lot of work on the wiring and 232 before I can blame the 140.

The only changes that would be appreciated would be if the squelch and power controls were reversed (the power is a very sensitive slide switch and would be better as the rotary POT) and if an SWR meter was included. But, in that price range you can't expect everything.

Good luck with your decision es 73

Source record: 14727

CEO summary:
Re: Tunable front ends
I have the same problem with my wife's Kenwood TH25AT. It's designed to have a wide-band front end so you can tune the 150-162 Mhz range. Unfortunately, all that RF energy is also present when you're trying to tune the 144-148 Mhz band. Bearcat scanners used to advertise a "tracking" front end, which was just a varactor tuned filter that peaked the front end for the frequency you were listening to. I suspect that the more expensive commercial radios do the same thing, at least I bet the synthesized ones do.

There are really two issues. One is that you want a good DC/low frequency
ground to protect against shocks. The other is that probably want a good RF
ground, especially if you are using some kind of unbalanced antenna like a
long wire. The 3-prong cord (assuming correctly wired 3-prong outlets) will
provide a decent DC ground, but for RF, it's another piece of random wire.

For a receiver this is probably not a live or die kind of thing, but you
could try running decent ground and see if the signal level comes up
noticably or the noise level decreases. Of course you also want a good
ground for your lighting arrestor, so you might as will hook it up to the
radio while you're at it...

4794. 1989 Third-Party Countries List (SOURCE: "The FCC Rule Book")

Newsgroup: rec.ham-radio
Date: 1989-12-14 17:45:26 UTC
From: rlwest@flopn2.csc.ti.com
Message-ID: <8912141747.AA12298@ti.com>
Source record: 14826

(SOURCE: The FCC Rule Book, Eighth Edition, First Printing, 1989, p.13-13)

Table 1

International Third-Party Traffic--Proceed with Caution

Occasionally, DX stations may ask you to handle a third-party message to a friend or relative in the States. This is all right as long as the US has signed an official Third-Party Traffic Agreement with that particular country, and the traffic is noncommercial and of a personal, unimportant nature. During an emergency, out State Department will often work out a special temporary agreement with the country involved, but in normal times, never handle traffic without first making sure it is legally permitted.

US Amateurs May Handle Third-Party Traffic With:

C5 The Gambia V2 Antigua
CE Chile and Barbuda
CO Cuba V3 Belize
CP Bolivia V4 St Christopher
CX Uruguay and Nevis
EL Liberia VE Canada
GB Great Britain* VK Australia
HC Ecuador VR6 Pitcarin Island**
HH Haiti XE Mexico
HI Dominican Republic YN Nicaragua
HK Colombia YS El Salvador
HP Panama YV Venezuela
HR Honduras ZP Paraguay
J3 Grenada 3D6 Swaziland
J6 St Lucia 4U1ITU ITU, Geneva
J7 Dominica 4U1VIX VIC, Vienna
J8 St Vincent 4X Israel
JY Jordan 6Y Jamaica
LU Argentina 8R Guyana
OA Peru 9G Ghana
PY Brazil 9L Sierra Leone
TG Guatemala 9Y Trinidad and
TI Costa Rica Tobago

* Third-party traffic permitted between US amateurs and special-events stations in the United Kingdom having the prefix GB only, with the exception that GB3 stations are not included in this agreement.

** Since 1970, there has been an informal agreement between the United Kingdom and the US, permitting VR6TC and US amateurs to exchange messages concerning medical emergencies, urgent need for equipment or supplies, and private or personal matters of island residents.

Please note that the Region 2 Division of the International Amateur Radio Union (IARU) has recommended that international traffic on the 20- and 15-meter bands be conducted on the following frequencies:

14.100-14.150 MHz
14.250-14.350 MHz
21.150-21.200 MHz
21.300-21.450 MHz

The IARU is the alliance of Amateur Radio Societies from around the world; Region 21 comprises Member-Societies in North, South and Central America, and the Caribbean.

Note: At the end of an exchange of third-party traffic with a station located in a foreign country, an FCC-licensed amateur must also transmit the call sign of the foreign station as well as his own call.

The above table is excerpted from "The FCC Rule Book" for the information of amateurs via electronic distribution. For further information, contact the American Radio Relay League, 225 Main St, Newington CT 06111 (203) 666-1544.

NO! NO! NO!

rec.radio.shortwave was created for ALL people who like to listen to
radio communications, from DC to daylight. The original call for
discussion and call for votes posted by Richard Shapiro made it
clear that the group was not intended to be limited to HF, as did
numerous postings during the discussion period. The group is for
all radio monitoring hobbyists. If the scanner enthusiasts want to
create their own group, more power to them, but it would be wrong,
impolite, etc., to chase them out of a group that they were
specifically welcomed in to from day one.

Seems to me there isn't much point in having such a totally meaningless
piece of information (such as RST) in the exchange at all. Contest rules
should either require some information be exchanged which isn't automatically
known, or drop the exchange requirement. Why clutter up the bands with
all those "59's" and "599's"? On the other hand, shouldn't a valid
contact consist of a little more than an exchange of call signs?

Speaking of call signs, shouldn't stations be required to give their own
call at least once per contact?

>You need the exchange to get the multipliers (states, countries, zones, or
>whatever), but the signal report is really superfluous.

In fact, in the CQ WW DX contest, all you need is the callsign to figure out the exchange. Notice how you never hear a DX station ask you to repeat your report, but they will ask you to repeat your callsign (maybe it's just me, I do run 5W on occasion). The only times this doesn't work is for folks operating outside of their 'standard' zone (i.e. AD1C operating from California). Then the DX station may ask for a repeat on your zone, since that's confusing. In the ARRL contest, you need to get the power, which is is different for each DX station, and the DX stations need to get your state. Are Q rates in the ARRL lower than in the WW (Ken, K1EA, you may answer this one if you're so inclined ;-).

I ran QRP in the CQ WW DX Contest this past November, and yes, I had to repeat my call a lot! But I got 599s from he same stations. Strange! I did notice this year that some people gave out 559s, about 4 if I remember correctly. The rest were 5NN. In previous years, I got 579s instead of 599s. Guess it's easier to type the same 2 numbers (i.e. the two 5s) than three distinct numbers (579). But it's easier to write a '7' than a '5' by hand.

jim, AD1C, AD1C, A-D-1-C, A-D A-D A-D-1C etc. etc. etc.

> Sad when it happens, but this is NOT true. ...

Another thing to consider - this was the first time I had seen your message,
and I'm pretty good about getting in and reading the articles here on
rec.ham-radio. More than once I've heard of articles not making it off
the system from which they were posted, so that MAY be what happened to
yours.

Sorry about the fact that nobody replied. (And see Warren's post for
some other ideas about things which may help improve your reply rate)
I generally email a reply to folks who post messages like that and ask
them if they got the help they needed, most have already been deluged
with replies by the time I get around to it....

And, for those who think that this should have been just an email message
rather than a posting - sure, but there is a good chance that others may
have asked for help and not gotten it, so I posted. Thanks for your
forbearance (you *do* have forbearance, don't you? :-)).

Before 1972, I believe the only prohibition was against "remuneration for use of station". That is, you could not accept payment for use of your station. Interestingly, you COULD accept remuneration for OPERATING. It was quite legal to pay a "hired gun" to come in and operate your station in a contest, for example. That was also why it was legal for ARRL to pay the W1AW operators.

I went to work at W1AW when I graduated from college in 1972. Not long after, the FCC "clarified" the rules to make it illegal to pay operators, and then had to come up with a whole new set of rules to again make it legal to pay operators of code practice/bulletin stations. Our tax dollars at work.

> ----------

Sorry, the boundary between near and far field is a function of
effective aperture diameter in addition to wavelength. "Reference
Data for Engineers" gives the boundary as D squared over lambda,
where D is the diameter of the equivalent aperture and lambda is
wavelength. For a half-wave dipole, D= .41 wavelengths.
For a quarter-wave vertical (over a ground plane) D=.82 and N8DGN's
definition is almost right. For a 6 foot C-band TVRO dish,
D is about 24 wavelengths. For the 230 foot dish at Goldstone that
tracks interplanetary spacecraft at 8.2 GHz., D is 1916 wavelengths,
so the far field starts at 4 million wavelengths or 83 miles.

Source record: 14821

Don't forget that some people work contests mainly to pick up new countries/zones/states, and follow up with a QSL card. The other guy has to put a signal report on the card for most awards.

On the other hand, there are contests where you don't send a report (e.g. Sprints), and whenever I've sent a card to someone as a result of a QSO in such a contest, the card comes back with a report on it (yes, it's always 599).

There's actually an award you can get for working all continents and getting 59 or 599 reports from each one. Perhaps someone should offer a certificate for getting any report *but* 59 or 599, indicating that you have actually exchanged some meaningful information with someone.

How about Sun Workstations? or in the "home" market, Amiga lets you use the mouse for just about everything, or stick with the keyboard and various c- or k-shell like interfaces.

> [sigh] But most of us cannot afford a "real computer" and must

This is hard without multitasking. Again, amiga is the only "home" computer that comes with it. You can get aftermarket operating systems with multitasking for most other computers (os2, os9, unix, etc), but you might not be able to find packet software for those systems.

Clone land is your bet if you want to roll your own from swap meet components etc. or if you want to run on batteries (lap top).

4807. Builder's Success - HF Sweep Tube Amp

Newsgroup: rec.ham-radio
Date: 1989-12-14 23:14:41 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880099@hpfcdc.HP.COM>
Source record: 14813

I've been pestering the net for the past few months about a Rube Goldberg HF linear amp I've been building from a buncha 6LQ6s. I finally got it working well enough to report the results.

Much of this will be familiar to the OFs, but many of us younger OFs weren't around during the sweep tube period in the 60s and 70s. I had quite a bit of trouble finding information on them, and had to rely on friend's old QSTs, ca 1969-1970.

Sweep tubes are interesting beasties to work with. They have a relatively high plate capacitance, low plate voltage (I used 800 V), dissipate 30W continuously, or 300W for 10 seconds. For this reason, they make good SSB amplifiers. Another advantage is that you can usually find someone trying to get rid of these dinosaurs - I got some for $4.95.

I found the DeMaw articles (QST 1969, 1970), and used his biasing arrangement to balance the currents in six sweep tubes. I used a bias voltage of -20V, and then used 10K pots to set the individual grid voltages to somewhere around 14 volts. The grids (control, screen, and suppressor) were RF grounded through a .01uF disc ceramic.

The input circuit was merely capacitively coupled to the cathode. I put in a 1 ohm resistor and RF choke in the cathode circuit to meter the plate current. I may add a real tuned input circuit in the future, but my old Kenwood TS520 is able to resonate the input circuit, so it is not a priority.

The output circuit was a conventional pi, with Rp = 450 ohms. This was determined with the standard equation - Rp = Vp / (Ip * K) - right out of the ARRL Handbook. At this low Rp value (>2K is the norm), the tune and load variable capacitors become quite large, adding to the cost.

I made the mistake of using a disc ceramic in parallel with C-tune for the 80 meter band, and promptly burned two of them (let the smoke out in electronics parlance). The small disc ceramics cannot handle the current. I've given up on 80 meters until I can find a doorknob-type capacitor. I used commonly available silver-mica in parallel with C-load, which seem to be tolerating the current so far. I have gotten 40 and 20 meters to work, while 10 and 15 are elusive, probably due to the high plate capacitance of the six tubes in parallel.

I'm running the amplifier slightly into the class C region, and am getting 60-65% efficiency out of it. The loaded tank Q is around 12, and total output power is over 400 watts (my RF meter scale only goes up to 300 :-) with about 80 watts drive. So far, most of my testing has been limited to a dummy load, since I am unsure how to measure harmonic

power and how the FCC expects us poor hams to comply with their 40dB (is that right ?) harmonics floor.

Next on the agenda is a trio of 4CX250Bs. I've found a cheap (free) source of used tubes that still have some life in them. We'll see if I can hit the 1500W legal limit with those. After balancing 6 sweep tubes, a trio of real transmitting tubes should be a piece of cake.

Thanks to the Net for all the help. It's always nice to know we still have the capability to build useful equipment out of baling wire and bubble gum.

```
From NASA SPACELINK
Provided by the NASA Educational Affairs Division
Operated by the Marshall Space Flight Center
-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-
Amateur Radio Retransmission of Shuttle Audio/Video
```

NOTE: This information is unofficial, and its accuracy is not guaranteed.

The Goddard Space Flight Center Amateur Radio Club (GARC) has transmitted, by Amateur Radio, NASA Select audio on the following frequencies:

75 Meters; 3.860 MHz. U.S. and Canada coverage*

40 Meters; 7.185 MHz. World wide coverage*

20 Meters; 14.295 MHz. World wide coverage*

15 Meters; 21.395 MHz. World wide coverage*

10 Meters: 28.650 MHz. World wide coverage*

AO-13 (AMSAT OSCAR) Satellite; 145.945 MHz. Primary; 145.955 MHz. Alternate. This Mode B requires a satellite-high gain antenna

*Coverage is dependent on Solar Activity and Ionosphere conditions. With a good short-wave receiver and outside antenna, reception should be possible. Due to ionospheric conditions and time of day/night, certain bands have better reception. A search of each band is recommended.

The GARC plans to re-transmit Shuttle video on Amateur TV for hams and ham TV watchers in the Washington, DC area. Contacts at GSFC: Russ Jones, N3EGO, or Frank Bauer, KA3HDO.

The Marshall Center Amateur Radio Club will re-transmit NASA Select audio at 147.100 MHz., 145.1 MHz., and 173.025 MHz. These transmissions can be heard only in the local Huntsville, Alabama area.

Persons in the JPL, JSC, KSC, and possibly other centers may provide this service via amateur radio and other means.

> Go with a 386 if you can afford it (Unix runs nicely on a 386). Go with
> a 286 system if the 386 breaks the budget.

If price is a big consideration (when isn't it) you should at least look
at the 386SX motherboards. No, they don't have a 32 bit data bus.
Yes, they do benchmark out as slower than a REAL 386. Yes, there are
286 motherboards based on the Harris 286 chips which are faster when
running 16 bit software. But, you knew this was coming, UNLESS you find
a great deal on a real 386, the 386SX is cheaper than the 386, and
it runs 32 bit software exactly as if it were a real 386.

> Unix runs best on a fast 386 with big harddisks, however, that said,
> Unix will run quite nicely on a 16Mhz 386 with a modest (80M) hard disk.

SCO XENIX runs adaquatly on a 386SX with one user. It's marginal with
two users. A ten user system would probably be useless. You can also get
by with a much smaller hard disk (40M) if you choose which parts of
the OS you install wisely. All in all, a 386SX system with a 40M
disk drive would make a great *NIX workstation for a hobbyist. (I assume
we are hobbyists here.)

My guess is that this has really very little to do with us specifically.
It is, I'll bet (got a nickel?), basic paranoia, them wanting to cover their
own backside, just in case some person or persons unknown out there use the
radio for some undetermined purpose and there is all this unpleasantness
generated by some yet undisclosed individual or group over the whole matter.

Sounds like totally non-parametric thinking to me, but go figure people...

Happy New Year Anyway.

>
> Not very many people.
>

OBSERVATION:

Having watched times from our VE testing sessions to the time our folks get their tickets in the mail, (and other folks' sessions and turnaround times) SIX WEEKS is what you can reasonably expect.

One of our guys counted 44 days from the time he took the test to the day he got his real thing (he got to operate "temporary AA" so it wasn't so bad!)

Another got the license in about the same time (plus or minus a day or two for local mail loading) but went from NO LICENSE to GENERAL and was on pins and needles...

Congrats on the new license (whether BRAND NEW or UPGRADE) and hope the time flies for you--HAVE FUN ON THE AIR!

I agree completely.

>Seems to me also that you want an antenna that has a low angle of radiation to
>minimize the amount of the overhead sky that the antenna "sees". A simple dipole
>is not too good in this regard. Sounds like a good arguement for a vertical
>antenna of some type or of course a yagi if you have $$$ and space.

One would think that a vertical would be great for receiving dx, however
my experience with them is that they are fine transmitting antennas,
but lousy for receiving. The problem is that they pick up too much
noise, both locally generated and atmospheric. It seems that all the
local noise generators, such as line noise, TV birdies, touch-and-glow
lamps, cable TV hash, etc, are all mostly vertically polarized, perhaps
since these sources are close to the ground so the horizontal components
tend to get canceled when combined with ground image reflection. Also,
most indoor antennas are poor receiving antennas, not because of the
poor efficiency due to the surrounding building, but because they are
so tightly coupled to power line noises. I think a simple dipole is
very effective for receiving. Don't worry too much about its efficiency
or swr, just try to get it as far away from noise generators as possible.

Source record: 14736

Grounding - DO NOT use the three-prong mains ground! In my house, there
is a coil connected between the three-prong 'ground' and true 'ground' - this
is the coil of the ground-leakage trip. It will hence present a high
RF impedance to 'true' ground.
Also, beware that any ground on your radio does not bypass the
'ground' (actually a current sensing trip)
or the safety protection provided by the ground leakage trip may be
bypassed too.
In my case, i disconnected the ground from the 3-prong mains plug on
my radio, and use a separate 'radio ground' of known low impedance. I had an
old water-boiler (actually a 55-gallon copper tank!) buried outside as the
RF ground.
Alternatively, if you use a balanced antenna (like a dipole) then theres no
need for a RF ground connection. (but you may still need one for static
protection and electrical safety - consult your local building regulations on
this - they may require a minimum cross-section of grounding conductor).

I know I posted a follow-on to this, yesterday...did it get "eaten" by
the system or something?

I was pointing out that I have modified my TH-75A by removing one
green wire behind the front case of the radio. This mod allows
full coverage of the 420-450MHz band, and then some. The display
will read out from 147.000 to 511.995. If anyone out there knows
how to tune the PLL, I'd appreciate that information. I'd like to
see if the rig will operate in the 220MHz band.

Also, I have modified my XYL's TH-25A, thanks to the posting of
those instructions here. I haven't yet tuned the PLL, but that's
"in the queue."

Thanks for the help here, folks.
Hope to chat at ya when I get the HF station
going again.

Mike (N5LTL; that's "Need 5 Ladies To Love")

4822. Packet compression

Marc Kaufman responds to Jim Grubbs' concern about compression: "However, I, for one, am getting tired of hearing from yhou why things can't be done. Why don't you just shut up and let us take our lumps (if any) from the FCC." Marc, are you saying that Hams should cease to be self-policing and just hand the burden to the FCC? I believe that every Ham should be concerned about the use of any methods or techniques that might work against the best interests of the hobby. And I DON'T think we should try to palm off the responsibility to the "Big Brother" we are all so afraid of. If the compression technique works within the established rules, then there's no problem; if not, then Jim has every reason to be concerned, as do the rest of us.

The August 1989 JARL CQ Ham Radio lists the 2SD845 for 260 Yen.
As nearly as I can make out this is from:

B M
New Akihabara Center 16-10
I-chome Sotokanda
Chiyoda-Ku, Tokyo

Telephone (771) 1994 FAX 253-8535

But I don't read Hirekana,Katekana or Kanji so I'm guessing.

I don't really think First Amendment rights enter into it. If it was only one ham talking directly to another, that would probably be a factor. But when they start acting as agents or "volunteer carriers" (as opposed to "common carriers") for third parties, it becomes a different ballgame. In that case, we aren't talking about message content; we're talking about whether or not we are allowed to act as agents for third parties REGARDLESS of message content. In that context, the FCC is undoubtedly fully within its mandate from Congress (and the ITU).

The bottom line is that we, or rather the bad apples among us, brought this on ourselves. I've been criticized in this newsgroup for being a legalistic vigilante, and yet the so-called "20 meter letter" issue came about because we hams, both severally and individually, have become lax over the last few years in policing ourselves strictly "by the book". It is becoming increasingly obvious with every passing day that the anarchism masquerading as liberal constructionism is damaging our cause.

If we don't march in step, it isn't a parade - it's just a bunch of jaywalkers.

Here we go again - committing hari kiri! This is broadcasting, not an informational bulletin pertaining to amateur radio. No wonder the FCC gets so disgusted with our lack of judgment and self-discipline.

>to find an un-contested frequency.

I hope you mean 28.300 - 28.600. The reason 10-meter contesters were operating from .300-.500 was that Novices contacts give you more points (right?) than non-novice contacts. I'm amazed that you were able to find a clear frequency *anywhere* on 10 meters!

Stu, KC1F, spent a lot of his time on 10 meters in one of the recent DX contests *above* 28.800 (like around .888). He had very high QSO rates, probably because of the clear channel. You don't need to operate in QRM Alley to get a good score.

Although there is a place on the DXCC form for RST, it not required by
the rules. I have had no problem entering NONE for RST on the DXCC form
when there is none on the card. I have heard one particular DX station
having fun with USA operators by not giving a report. When the stateside
station asks for a report "for the log", the DX stations says,
"Your're loud . . ., QRZ"

4831. Description of InstantTrack

Newsgroup: rec.ham-radio
Date: 1989-12-15 20:16:51 UTC
From: fpa@qualcom.qualcomm.com
Message-ID: <1241@qualcom.qualcomm.com>
Source record: 14757

i have received several messages via the net from folks who read the review of InstantTrack in '73 magazine, then wrote to the address listed there and have not yet rcvd a reply. The address listed was for Project Oscar, who allowed us to list their address, even tho we didn't know how InstantTrack would be distributed at the time the review went to press. Then, about the time letters were rolling in, the Proj. Oscar office was damaged in the San Francisco area earthquake. Everyone who wrote should receive a reply soon, from AMSAT. AMSAT will mail a one page description of InstantTrack to those who call or write. I have also taken the liberty of appending the text of that description to this mail...

InstantTrack 1.00 Now Available for IBMPC 11/20/89
==========

InstantTrack is a new satellite tracking program for radio amateurs, written by Franklin Antonio, N6NKF. It provides all the features of the tracking software you use now, and many you've only dreamed about. See the review in Nov '89 issue of '73 magazine.

Many of IT's best features involve the way that the user interacts with IT, and these are, of course, difficult to describe in writing. Nevertheless, here is a short summary...

Speed -- InstantTrack is faster than any other tracking program period. Humans should never wait for computers.

Ease of use -- Most commands are a single keystroke. Usually tedious functions are fully automated.

Instant Visibility -- InstantTrack shows you the positions of your "favorite" satellites, even before you issue the first keystroke. The menu of 200 satellites shows you which are visible from your location even before you select a satellite. The menu of 1754 cities shows you which cities are visible from the selected satellite even before you select one, etc.

Real-Time Displays
InstantTrack displays all the information you will normally need to operate with any satellite on its real-time display screens. Information includes: Azimuth, Elevation, Range, Doppler, Path Loss, Squint, (all shown for multiple observers) Sub-satellite point expressed as Lat/Lon, Gridsquare, and Nearest-City, Cartesian Coordinates of Observer and Satellite, Satellite Rise/Set Time, Satellite Mode, Right-Ascension, Declination, Sky Temperature, and more.

Graphics -- InstantTrack displays full color high resolution (EGA/VGA) maps of the Earth, showing satellite and observers position, two kinds of satellite footprint, grayline, etc. (Map projection is selectable.) Users can also select either a diagram of the satellite's orbit showing orientation of the satellite, or a map of the sky, showing the satellite's position against the field of stars.

You can move from map to map or satellite to satellite with a single keystroke, instantly.

Automated orbital element entry -- InstantTrack reads the popular NASA and AMSAT format satellite element files and updates its database automatically. You need never again manually enter dozens of 10 digit numbers.

Automated time setting -- InstantTrack automatically sets time on your computer by accessing the NIST (formerly NBS) time service via your modem.

Satellite & Station Database -- InstantTrack supports a database of 200 satellites and 50 observer locations. A unique grouping feature allows you to categorize satellites, and perform most operations on either a selected group, or the entire database.

City Database -- InstantTrack includes a database of 1754 cities worldwide. Locations of the satellite (sub-satellite points) and observers are displayed relative to the nearest city! Observing stations can be specified by entering as little as their city name!

Grid Squares -- InstantTrack understands the gridsquare system. Observing stations can be specifyed by typing only their gridsquare.

Satellite Covisibility -- InstantTrack shows you when satellites can see other satellites (i.e when crosslinks are possible), when satellites are in eclipse (in the shadow of the earth), etc. This display, of course, updates in real-time, so you can see crosslinks appear and disappear.

Squint Angle -- InstantTrack computes the angle by which the satellite's antennas are pointed away from you. Helps you understand why quality of communications via satellites such as Oscar-10 and Oscar-13 (spin-stabilized satellites with directional antennas) varies.

InstantTrack's graphics show you where a satellite's antennas are pointing. Maps display a contour line of squint angle. Stations within this line have low squint, and can establish the best links via such satellites.

Path Loss -- InstantTrack shows the path loss between observers and the satellite in realtime.

Schedules -- InstantTrack can show you the next three weeks schedule
for a satellite , or one day's schedule for 20 satellites on
one easy-to-read screen.

Realtime Rotor Control -- InstantTrack supports realtime antenna rotor
control via the Kansas-City-Tracker interface.

Background Mode --A unique background mode allows you to track
satellites & point antennas in real-time while you run other
programs.

Sun & Moon -- InstantTrack tracks the Sun & Moon as well as the
satellites in its database.

Fast Rise-Time Finder -- InstantTrack computes the time at which a
satellite will rise over the horizon without the usual delay
caused by stepping through small time increments between now
and then.

Tracking Multiple Stations -- You can see the computed parameters
(azimuth, elevation, squint, etc) both from your perspective
and from the perspective of the station at the other end of
the satellite link.

Documentation -- InstantTrack comes with documentation which is both
Extensive and Tutorial.

Online Help -- InstantTrack contains an online help facility which
can be entered from almost any screen.

Availability

InstantTrack is available from The Radio Amateur Satellite Corporation,
AMSAT-NA for $50. per copy ($70 if you're not a member) for individuals and
non-profit organizations. Commercial users please call for price info.

AMSAT-NA is a non-profit organization which builds and launches amateur radio
satellites. The author is a member of AMSAT, but has no financial
affiliation. If you buy a copy of InstantTrack from AMSAT, the entire
purchase price goes toward the amateur radio space program.

AMSAT-NA
Post Office Box 27
Washington, DC 20044

Phone: (301) 589-6062

Required Hardware...

Any IBMPC, or AT, PS2, clone, etc with at least 512k memory.

Any display type is ok for the text mode screens, but VGA preferred.
Graphics screens _require_ EGA or VGA display.

A numeric coprocessor (8087 or 80287) is NOT required, but it is recommended.

A mouse is NOT required, but can be used on the map screens.

Yaesu's FT-23R have this "tracking" front-end. They removed it in hopes of achieving a more sensitive rcvr in the -411 and -470. Ooops. Works great in the faraday-cage lab, but otherwise.... As reported earlier, they have the "fix" for this for the -470, just send your radio in to them. Why it's not a similar repair for the -411 is not clear to me.

====================================================================
(PLEASE NOTE: the following is a `re-posting' of an item from
about 3 weeks ago. Due to some system problems, I lost access
to INFO-HAMS for several weeks and, don't know if anyone ever
responded or not)
====================================================================

I'm looking for some other Tentec Paragon owners who have, or are
interested in, using the optional RS-232 port to control the radio.

I have an Amiga Computer and, although there aren't any `canned'
interface programs (for the Amiga), to provide access to the Paragon,
I've had reasonably good results by using a public domain terminal
emulator.

I have documentation on the IBM (and `compatibles') BASIC program
which Tentec sells and, have been using it to understand the format
of the Status `word' (several bytes in length) that's supposed to
come back from the Amiga. There appear to be inconsistances in the
portion reporting the radio's operating frequency.

If anybody's had experience in writing/modifying a computer program
to control the Tentec Paragon, I'd be grateful for thoughts/comments.

Paul WB5AGF

>Bill -KI6DG

I am quite curious about other owners of the FT470 and their experiences with the intermod problem. As Bill explains, there is a "fix" whereby the IF frequencies are changed in the HOPES of avoiding the local signals. The Yaesu engineer at Cerritos which I spoke to said that such a change was UNLIKELY to help in the general case. He said that the "fix" was used for some specific problems that occurred out in Illinois (somewhere in the midwest) where the IF was under direct attack by a local 2KW repeater signal.

Has anyone else out there asked Yaesu for the "fix" and what were the results? I am hesitant to send my radio away for several weeks for the "fix" (which they offered to do) if the improvement is marginal. The radio is usable to me as it stands, and I like it in my hand rather than out at the shop. Any other info?

P.S. Apparently Yaesu has just brought the price of the Ft470 down by about $50.00! It is now the cheapest (at the local ham emporium) of the big three (Kenwood, Icom, Yaesu) - but the alternative Alinco - which is a bit stripped down - is yet cheaper.

I don't want some contest overrunning the whole band. I'd like to see ALL
contests restricted to some portion of each band they operate on so that
those who don't want to operate the contest can still find a frequency.

> Yes, I admit that contests have a severe habit of disrupting normal net

>I am considering purchasing a Kenwood TS140. I would like to receive
>opinions of the rig from people who have them. TU es 73's

I like the 440 more. The $500 difference for a TS440S (with the built
in antenna tuner) is worth it, if only for direct frequency entry
keypad and SWR meter. The only thing that I wish they BOTH had is
a built-in electronic keying unit. I like a station with as few
separates as possible, for when I want to go portable, and it'd
be nice to just be able to plug in a decent set of paddles, with
the electronic keyer part built inside. (It's not even listed as
an option in the TS440S or TS140S ads, and there's no controls for
it on the panel).

The ICOM IC-745 has this as an optional internal add-on board. The
745 is a great rig, except no QSK (only semi-breakin) and it's 100 watts
(Kenwoods are 200w), and a TS-140 looks like a better deal than an
IC-735 (ours is a 745, no longer made).

Don't forget about the Yaesu 747, it looks pretty neat for the price,
except that the panel layout is not as high-tech and pretty as it
could be.

>In a few magazine articles I've seen the terms 'near field' and 'far field',
>but I can't find any mention of these terms in any of the radio or
>electronics texts I've tried. Can anyone define these terms?

The definition that I use in my research is that far-field is when an arriving signal appears to be a plane wave across the aperture of the antenna or array. The transmitted signal will tend to expand spherically - that is, lines of constant phase take on a spherical shape. When the sphere appears to be a plane at the receiving array then the radiation source is in the far field. The deviation from being in a plane is usually specified to be within so many degrees or wavelengths,
thus the near and far field boundary will vary with wavelength (frequency), and antenna aperture (size).

There is also a MIL- spec. which has a similar definition, although I can't recall what the number is right now. It has something to do with RF interference susceptability.

>Speaking of call signs, shouldn't stations be required to give their own
>call at least once per contact?

YEAH!!!!!!!!!!!!!!!!!!!!

BOY is it AGGRAVATING to listen to some bonehead call "QRZ?" and then
repeat the calling station's callsign, say "THANK YOU FOR xyz, QRZ?"
and give his own callsign every 10 minutes or so!!!

(1) It's not fair to me, as a contest participant, to have to wait
for you to give your callsign sometime in the next 8 or 9
minutes. I spend this time waiting to hear who you are,
when I could be out contesting. You would *THINK* that the
big guns who are calling CQ on some freq. would show a
little more courtesy in this respect.

(2) The law states at least every ten minutes during and at the end
of EACH COMMUNICATION. This means when you're DONE talking
to ME, you give your callsign, *NOT* in 10 or 15 exchanges,
after EVERY ONE. I don't think that there's any room
here for interpretation.

This is the way *I* operated, and it didn't hurt at all.

It would be nice if the ARRL were to schedule the 10 meter contest (which proportionally should interest college students more, since that tends to be a place where lots of new novices and techs concentrate) at a time when it is NOT getting into FINALS WEEK for colleges and universities.

Can someone suggest a better time? It needs to be between the latest term starting times (late Sept and early Feb) and a few week BEFORE finals (i.e. mid Nov and early April) and must avoid SPRING BREAK. These are the times most students can reasonably expect to be interested in operating, given their usually hectic studying schedules that always get worse as the terms progress.

Date: 1989-12-16 01:50:38 UTC
From: storkus@arrakis.nevada.edu
Message-ID: <1124@unsvax.NEVADA.EDU>
Source record: 14763

Ok, since so many people are having mail bounce problems, and even though I don't want to waste net bandwidth, I'm going to post the UNENCODED program to this news and also to REC.RADIO.SHORTWAVE. As I am leaving for home tomorrow, and will not return until mid-January, I think this is necessary.
The file will be in unencoded ascii code. All you have to do is remove headers and the like. I will post it later tonight.
I'm sorry for any inconvenience this will cause to the network, but it is necessary. The WEFAX program is NOT long, and will only consume as much room as a typically long message (or a couple of the messages from these stupid threads we're seeing). 73's, Mike, N7MSD (Sig file will be in program message)

4843. Re: SONY 2010 MODS WANTED!!! Desparately

Mike,

I think it's great that you are experimenting with antenna designs. We should see more of this kind of worthwhile discussion on the net.

A couple of comments though...

1) What you have is a vertical antenna with a tuning inductor built in. That is why you can obtain resonance with only 4' of height on 49m. A short vertical antenna will have a capacitive reactance that must be resonated with inductance which you have incorporated into the antenna itself. The radiation pattern, I would guess, is similar to that of a 4' monopole. The fact that the reactance is distributed over the length of the antenna helps to make it more broadband.

2) I can appreciate the space saving aspect of the design, but you get what you pay for. I don't think you can do better than a full length antenna. To capture the most energy you need as large an effective aperture as you can get. However, I have no doubt that you can do better than your window antenna (which, I admit, do work remarkably well).

3) Helical designs are most effective when the diameter is one wavelength or more. This makes it radiate in its axial mode which gives it some directive gain (not too practical at HF).

I would dearly love to see someone come up with a compact antenna that performs as well as the big ones, but I think we're up against one of those doggone physical limits here.

Keep up the good work.

73's de Tim, WB9MVP

4845. WEFAX 105 Program

Newsgroup: rec.ham-radio
Date: 1989-12-16 04:11:21 UTC
From: storkus@arrakis.nevada.edu
Message-ID: <1125@unsvax.NEVADA.EDU>
Source record: 14767
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Because I will be leaving home tomorrow and I am STILL getting requests for the WEFAX 105 program AND getting complaints that people can't access the LISTSERV@PUCC.PRINCETON.EDU database, I am putting it up here in plain ascii code. Simply remove all information not part of the program and save it to your disk as an ASCII Basic Program. Yes, I KNOW you're not supposed to do this because it wastes net bandwidth, but I am compelled to due to the amount of requests for this. This program's length is about as long as some of the messages we've been seeing here lately.

Now a few tips for using the program, but 1st a warning:

BE SURE THAT YOU DO **NOT** TURN UP THE AUDIO TOO LOUD ON YOUR RADIO!!!!!!!

The friend that gave this program to me knows someone whom he gave it to that burned out the cassette port on his computer due to too much radio audio. So, don't say I didn't warn you.

As I have said, the program uses the CoCo's built-in cassette port to receive and demodulate weather faxes (and others). The pictures are of very high quality, but there is no grey scale. It runs on ANY Color Computer (but it was designed to run on the 1 and 2), and runs in Disk Extended Color Basic (DECB), which is what is built into the machine's roms when you buy it.

Although a disk drive is not required, if you're thinking of saving pictures you will need one. Because the size of the pictures (they are a basic memory dump), the program does NOT use files, but the whole disk! Because of this, BE SURE to use a clean disk for saving pictures. 1 Single-side disk will store 2 pictures.

As far as hardware between the computer and radio, you simply need a cable to connect between the audio input portion of the cassette port and the earphone plug of the radio. Since the cassette plug is a 5 pin DIN, this is easy. A pinout of the port is given in the CoCo's manual (one of them).

So, remember the warning...get set up...and have fun!! 73's and see you in mid January (please don't send me mail until then, as it will probably bounce, and if it doesn't, I won't be receiving it), Mike, N7MSD

Totally consistent with:

N3xxx: "You're 59 Pennsylvania, please repeat your call, report and state"

So why do they require signal reports in contest exchanges?

>hand the burden to the FCC? I believe that every Ham should be concerned about
>the use of any methods or techniques that might work against the best interests
>of the hobby. And I DON'T think we should try to palm off the responsibility

Did I say I didn't think we should be self policing? I just don't remember electing Jim Grubs to be the police officer. In almost every aspect of everyday life I can make a "reasonableness" test with respect to the letter of the law vs. compliance. I have been known to drive faster than 55. I have been known to park longer than 1 hour in a 1 hour zone.

The ARRL and Mr. Grubs notwithstanding, ONLY THE FCC has the power to enforce the regulations - if they wish to. I guess I don't mind Jim "viewing with alarm", but he is NOT the authority on the matter, and he is NOT empowered to enforce his views on the rest of the Ham community. He should be careful to state that "IN HIS OPINION" such-and-such is true, but unless he is an administrative law judge with the FCC, he has NO RIGHT at all to declare that such-and-such is true.

Most of the privledges we have lost - the Eye Bank - public service at organized events -- have been because someone like Jim Grubs read the rules, interpreted them in an overly strict manner, and then went running to the FCC and forced them to take a stand on the issue. Its sort of like driving on the street. If I go 35 in a 25 zone, carefully, no one will mind (usually). If I honk my horn, blink the lights and wave, I will probably get stopped for speeding.

In the case at hand, with respect to compression, anyone working in the field knows that standard compression methods are NOT encryption, just as the "scrambler" in a synchronous modem is NOT encryption -- they are just tools to control the bandwidth and utilization of time-frequency space. That is, after all, what amateurs are supposed to do == experiment with ways of improving the utilization of the radio spectrum. I do not require that Jim understand the technology behind this, nor do I require that he participate. However, he seems to be convinced that he has sufficient knowledge and authority to make definitive statements on the legality and appropriateness of any and all actions taken by others. B******T.

He (and you) can hold any views you want. You can even air them in this forum. Please, just don't arrogate to yourselves the authority to control the actions of others.

In the US, at least, GFI (Ground Fault Interrupter) circuits are only required in areas where there is a significant chance of contact with a "real" earth ground. Outdoors and in bathrooms. I can understand using your rig outdoors,.... but in the bath?

>Also, beware that any ground on your radio does not bypass the
>'ground' (actually a current sensing trip)
>or the safety protection provided by the ground leakage trip may be
>bypassed too.

Good point. In the circuit breakers I have seen lately, though, what is sensed is an imbalance between the two power legs, the assumption being that the difference goes to ground - through whatever path (not necessarily the ground wire). There is no coil in the ground path in US breakers. A real problem is that of RF getting into the breaker and tripping it. I try to use unprotected (no GFI) circuits when I can.

4851. "Feng Yun"?

Newsgroup: rec.ham-radio
Date: 1989-12-16 17:48:37 UTC
From: roskos@IDA.ORG

Cross-posted to: rec.ham-radio,rec.radio.shortwave

Does anyone have information on a Japanese weather satellite called "Feng Yun"? I found it mentioned in some information from Vanguard Labs (a manufacturer of WEFAX equipment), but it's just a one-line reference:

137.85 MHz - Japan - Feng Yun

This and a statement "see what 7 US, Russian, and Japanese Satellites See" on the cover of their catalog is all I've ever heard of it. I knew Japan had a geostationary meteorological satellite, but this one is apparently a polar satellite. I'm trying to find out the orbital elements for it; it doesn't seem to be in TS Kelso's list of NASA orbital elements, at least not under that name.

I was the person who investigated and posted the mods for the th-x5at
Kenwood HTs (except the th-75at). You will not be able to retune the
pll in the radios as far as you are suggesting without extensive
modification to the pll. You would also need to do extensive
modification to other sections in the radio, namely all the RF sections.
I don't advise trying this; it's probably a lot cheaper and far less
frustrating to just go buy a radio already on a frequency close to the
one you are interested in.

Can you please post the info on how to modify the th-75at? I missed it
here. Thanks.

I have been waiting 56 days for my upgraded ticket (a->e + new call), and have recently begun wondering what's normal and when I should start getting worried. From scanning the Aug and Sept new extra calls in district 6, it seems that the FCC may be processing them as infrequently as once/month. Earlier this year, I submitted an address change, and got it back in about 32 days. Seeing as the VEC does all the work for upgrades, it wouldn't seem that there was much difference in the FCC processing required.

When I finally do get worried, does anyone have any suggestions whom to call? The FCC? The VEC? David Horowitz...

> it? Sheesh, who are you anyway, The Incredible Iron Ham Man?

I agree. The guy has definatly lost it. If I wanted to have a fight I can
go to any local bar and start one within a few minutes. That's a lot cheaper
than either ham radio or computers.

When I was a kid I used to think hams were a wonderful bunch. I got excited
about it and actually saved enough money to by Realistic DX-150. Then I got
stopped cold by code. (Who does a 12 year old kid that lives in the boonies
pratice with?) In later years I got interested again and found someone to work
with me. With a little encouragement I actually got a liscense. Then I found
the bands full of this kind of stuff and am now thoroughly disinterested
in HF. I for one would fully support taking all HF bands away from the hams
just to see if maybe we could get rid of some of the riff-raff.

Avatar, the signature is for you.

Message-ID: <8912170846.AA22277@ucbvax.Berkeley.EDU>
Source record: 14634

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

You started this thread by being ignorant of crypto techniques and making the assumption that modern crypto hardware was easily broken into. What he was saying was that there are two keys. One you publish, the other you keep secret. The system is patented/copyright/trademarked (and God only knows what all) with the owners looking to make a billion before they die. I think they want to sell each package for the same price as a Chevy. What you are looking for is the Public-Key Cryptography. One key is used for encryption and made public, the other key is for decryption and kept secret. Personally I think something less complex would suffice. To answer your question, no.

> Dube Todd, N5PDK

Unspecified codes can be used only in VHF and up. I'm thinking off the top of my head, but 2 meters and up come to mind. Jim Grubbs has never read the FCC rule book. I say that because everything he says is wrong. If not wrong, it's only because he reads the rules as a Communist would. Each community has a person of this type. They listen to the most active frequency and then tell us the rules. My reply is to have them notify the FCC, cause I ain't changing my operation on some stupid interpretation by an idiot. Self policing is more of a peer pressure than "on the air lawyers".

Article 360 (1 more) in rec.ham-radio.packet:
From: Jim.Grubs@f1.n234.z1.fidonet.org (Jim Grubs)
Subject: FINDLEY SPEAKS OUT ON ARF

>> From: arf@jolnet.ORPK.IL.US (Jack Schmidling)

>> FINDLEY SPEAKS OUT ON ARF

>> Paul Findley, author of "They Dare to Speak Out" will be
the guest on the Amateur Radio Forum this Thursday night.
This is a profoundly disturbing book about the influence of
an alien government on the Congress of the United States.

Grubs whines:

>Here we go again - committing hari kiri! This is
broadcasting, not an informational bulletin pertaining to
amateur radio.

Arf says:

This whimpish whining represents all of the intellectual
power of a world class NURD.

There were 15 check-ins, 4 of which were given the
opportunity to ask questions of Mr Findley. One of which
was extremely critical of his position.

Just what on earth does this type of forum have to do with
broadcasting? Do you have any idea of what the word means?
If you want examples listen to W1AW or K1MAN.

Where the hell does it say that ham discussions must pertain
to amateur radio?

> No wonder the FCC gets so disgusted with our lack of
judgment and self-discipline.

ARF says:

No wonder young people are so disgusted with ham radio and
the hobby is falling apart. Nurds like you and your moronic
contests and discussions about rubber duckies are a real
drag.

Do the hobby a favor and say something intelligent on the
air. It might catch on, but I doubt it.

Good luck in the contest,

4861. Broadband Antennas

Newsgroup: rec.ham-radio
Date: 1989-12-17 08:28:37 UTC
From: kaufman@Neon.Stanford.EDU
Message-ID: <1989Dec17.082837.10083@Neon.Stanford.EDU>
Source record: 14638

I have a nice site (2100', 7 acres), but zoning height restrictions (35' unless I want to pay big bux for a variance). Also, I am lazy. So I am thinking about broadband antennas. Specifically, I have seen ads for the Barker and Williamson AC 3.5-30, and the Garant GD-9. Both are long wire dipoles (windom in the case of Garant) with 'magic' matching networks.

Does anyone have any experience with one or both of these things? Alternate antler theories will also be considered.

Marc Kaufman, WB6ECE (kaufman@Neon.stanford.edu)

4862. * SpaceNews 18-Dec-89 *

Bulletin ID: SPC91218

SpaceNews

MONDAY DECEMBER 18, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly
around the world. It is available for UNLIMITED distribution.

* STS-32 NEWS *

US Space Shuttle "Columbia" is currently located at launch pad 39-A at KSC in
preparation for mission STS-32 later this week. If a launch delay occurs, then
the mission will be postponed until January 1990. Columbia will be using the
newly refurbished launch pad 39-A at the Kennedy Space Center. Pad 39-A was
last used in January 1986.

During mission STS-32, the crew will deploy the SYNCOM IV-05 communications
satellite, and retrieving the Long Duration Exposure Facility (LDEF).
This will be a unique mission since it requires the support for both a payload
to be deployed and the return of LDEF. LDEF's processing and de-integration
work at KSC will involve operations in the Orbiter Processing Facility, the
Operations and Checkout (O & C) Building, and the Spacecraft Assembly and
Encapulation Facility (SAEF) number two.

* OSCAR-10 OPERATIONS *

AMSAT-OSCAR-10 is currently available for Mode B transponder operations on
a continuous basis. Please remember to use the minimum uplink power required
to facilitate communications.

* OSCAR-13 OPERATIONS *

Here is the latest operating schedule for AMSAT-OSCAR-13:

MODE B MA 000 to MA 110
MODE JL MA 110 to MA 145
OFF MA 145 to MA 150
S BEACON MA 146 to MA 147
MODE S MA 147 to MA 160
MODE B MA 150 to MA 225
OMNI ANT MA 225 to MA 035

* SpaceNews NEWS *

SpaceNews has been in existance for over two years, and some of you might be interested in how these bulletins are created each week:

SpaceNews bulletins are written and distributed using Amateur Packet Radio (AX.25) technology. Issues are edited using a Commodore 64 computer. Much of the news contained in these bulletins is obtained from amateur satellite OSCAR-11. Orbital predictions of the spacecraft, as well as data capture and decoding functions are also performed using a Commodore 64 running software specifically designed for use with the OSCAR-11 spacecraft (written by KD2BD).

Other important news souces include NASA, ANS (The AMSAT News Service), and USENET. SpaceNews has been available on USENET for just over one year now. It has been available on Amateur Packet Radio (AMPR) for two years, although the distribution paths sometime change. It is available for free distribution and can be found on electronic news systems all over the world.

I always appreciate hearing from the readers of SpaceNews, and try to respond to all comments and suggestions received. It takes a lot of time and work to prepare SpaceNews each week (which is why it sometimes doesn't get out!), and it is the interest of SpaceNews readers that make the effort all worthwhile.

Thanks and Happy Holidays Everyone!!

...John A. Magliacane, KD2BD

Thanks Brandon. I'm not a ham; I stick to swl'ing. I can understand an irritation from some "locals" that a newgroup should stick to its founding premise, ham'img, rather than being infested by swl-only-stuff. From what I've seen over the last few weeks, this has not been the case, IMHO. Does anyone object to someone like myself who asks a question about antennas? I would hope not, this being such a common thing to ham & swl. But I can understand getting ticked off about postings of VOA/BBC/RM loggings, etc. in rec.ham-radio. Like in so many other groups, there those who will do dumb, obnoxious things. That's nothing new to usenet, as you and many others well know. As an swl, I would like to ask that swl's respect the rec.ham-radio newsgroup "members", their charter and intentions. Personally, though, I would not be annoyed with ham postings in swl. There's always going to be some overlap - just look at 40(41) meters :^)

]2) I can appreciate the space saving aspect of the design, but you get what
] you pay for. I don't think you can do better than a full length antenna.
] To capture the most energy you need as large an effective aperture as you
] can get. However, I have no doubt that you can do better than your window
] antenna (which, I admit, do work remarkably well).

I would like to dispell a widely held misconception here. While aperture
is important, what counts is EFFECTIVE aperture, not physical
aperture. A traveling wave cannot distinguish dimensions much smaller
than its wavelength. Hence, a magnetic dipole on a 6" loopstick is, in
theory, about as effective as a physical dipole (I don't have the exact
numbers here). A physical antenna that approaches a wavelength or
more in size starts to exhibit aperture related to its size. Smaller
antennas have effective apertures unrelated to their size.

Small antennas do have the following problems:

(1) Larger losses in impedance matching due to the large inductances
required. These can be VERY significant. Note that a magnetic
dipole (such as a loopstick) has these losses in both the matching
network and the antenna itself.
(2) Very narrow bandwidth OR very complex impedance matching OR
very high loss. You can't broaden the bandwidth without either
screwing up the match or de-Q'ing the antenna through IR losses.
(3) Lousy directivity. A magnetic antenna has a dipole pattern. I would
point out, however, that while a loopstick is not very directional,
it has a VERY sharp null and makes a very good DF antenna on HF.

4866. 6m opening

Newsgroup: rec.ham-radio
Date: 1989-12-17 18:28:50 UTC
From: kchen@Apple.COM
Message-ID: <37343@apple.Apple.COM>
Source record: 14639

There was an amazing (imho :-) 6m opening between the SF Bay Area and
Japan Saturday (Dec. 16) at about 2300Z.

I first stumbled on it when I heard a JA call CQ at about 2310Z. As I
scanned the band between 50.1 and 50.15, there were JAs everywhere! So
I picked a pileup and listened in on a local furiously working them.
I only have a 1 meter piece of wire (proverbial wet string) connected to an
Icom R-7000, and I was getting many of the JAs at S5 on the (very scotch)
meter. (With very little sky noise, even an S2 signal is 100% readable
with the set-up.)

About 15 minutes later, the band fell dead again. 10m was not especially
spectacular in the same time period. Is this one of the tropo openings??

Some of the grids heard were QM05,QM08 and PM94 (drool, drool :-).

Some of the prefixes that came through, like JG1 and JE1, I have not heard
on HF before. Are these the "no-code" Japanese licenses? I must say that
a 6m pileup is infinitely more civilized than, say, a typical 20m pileup. And,
if some of those gentlefolks were no-code types, what does this say about
the argument that the absence of code proficiency invites the riff-raff?

My first taste of 6m DX and all I could do was to sit by silently, cursing
the Friendly Candy Company for not having processed my 610 yet. QLF!

Any other areas experienced the opening?

Kok Chen kchen@apple.COM

<previous posting deleted>
<Jim explains his motivations for posting what he does about amateur regs>

>For one very simple reason -- when a few flout the regs, ALL of us suffer
>the consequences. The FCC commonly responds to regulatory abuses in ham
>radio by banning it for everyone. In the past, there was the "Eyebank Net"
>flap, the fallout of which seriously impairs public service projects to
>this very day. The present "20 meter letter" inquiry is a case in point.
>You watch, because of a few scofflaws, we'll lose 3rd party traffic. Because
>of RAIN and ARF, we may lose bulletin transmission.

Let us for a moment assume that you are the source of "TRUTH AND WISDOM"
instead of "ARF", (seems like a territorial dispute to me) what have your
numerous postings of the "you are not allowed to do this, you are not
allowed to do that" type done to prevent your prediction from coming true?
If you think that there is some silent majority out there cheering you on,
then you are sadly mistaken. The only person giving you support is Dube Todd
who was another person that went off trying to say that someone was breaking
the law by asking for military daily use callsigns. He happened to be wrong
but "his heart was in the right place" right? Your postings do more to
harden the resolve of these people than prevent anything. When you make a
person mad, they don't usually go out of their way to re-examine their
beliefs, they get hard headed. So even in the off chance that you are
correct on ANY issue, your postings are NEVER going to accomplish your
stated objective.

>Let's use an analogy -- how long would hobby aviation last if the Sunday
>fliers insisted that their private pilot's license gives them the authority
>to carry passengers who don't "pay" fares but who give presents or free will
>donations? What's the harm? My interpretation of the rules is good enough
>for me, and if I get caught, I'll take my lumps.

Interesting analogy Jim. A Private Pilot ticket allows you to "share" the
expense of a trip with your passengers. You can not be "chartered" to go
someplace (i.e. hired) but you are allowed to accept monetary donations
towards the expense of the trip. So what is the exact amount that you are
allowed to accept? If you tell me that I can only accept 50% of the actual
fuel cost, and I say that I will accept 70% of the fuel cost because I am
also considering the time on the engine towards overhaul, the averaged cost
of avionics repair, the cost of tie downs at the destination, etc., etc.,
then who is right and who is wrong? Neither of us really, since the key to
the issue is that I was going to the destination anyway and I was not
specifically hired or chartered by the passenger to do so ahead of time.

But here is where we get to the root of your postings. YOU have read the RULES and have gotten a meaning out of them that I didn't get. Who died and decided that YOUR OPINION or INTERPRETATION is always right? You ALWAYS come across as being the torch behind all truth and wisdom. If anybody disagrees with YOU then they are against amateur radio!

>I'm not trying to be a newsgroup nuisance. I'm trying to save my hobby from
>being ruined by a bunch of scofflaws who think doing things by the book
>isn't "now", who think obeying the law is an infringement on their personal
>liberties.

Well I will not comment on being a "newsgroup nuisance". However your comments on saving YOUR hobby really get to the root of this issue. It is not YOUR hobby Jim, it is OUR hobby. It is obvious that you think that amateur radio is a personal possession by many of the things you say and the postings that you make. The problem is that you just can't convince the rest of us that YOU own it! The problem boils down to the fact that you are deciding what people are "scofflaws", and who is "doing things by the book" and who isn't. You believe that if anyone ever disagrees with your interpretation of a rule, then they are hell bent for leather out to destroy "your" hobby. Do you yell "HI YO SILVER AWAY" before you write a letter for info-hams or packet-radio?

But like ARF, RAIN, DEATH, and TAXES, I will just have to get used to you, since there doesn't seem to be anything I can do about it. Are you mad yet? You are? Then think closely about how willing you are RIGHT NOW to consider whether any of the above is true. Get the point? What you write tends to make people MAD! It rarely makes them THINK, it just makes them MAD, and when that happens the usual goal of the reader is to cause the same effect right back at you. This starts a back and forth flame battle that sometimes goes on for a month or more.. then it finally dies down and then BANGO you write another posting and up goes the FLAME flag again! Do you consider this to be CONSTRUCTIVE?

What you apparently fail to understand Jim is that there is room for more than your personal interpretations of the rules. What you fail to understand is that you could be very wrong on some issues. What you fail to understand is that "your cure" can sometimes be worse than the disease, especially if you happen to be wrong. What you fail to understand is that disagreeing with you is not a DEFACTO rebellion against law and order!

I guess simply said Jim, YOU JUST FAIL TO UNDERSTAND..... PERIOD!

>
Yes it is possible to resonate out the capacitive reactance of the short antenna
by a lumped or distributed inductance but what you end up with is usually a
very small radiation resistance! This means that the ratio of radiation
resistance to "ohmic" resistance drops and you loose your power to heat.
In ship board MF antennas the radiation resistance is often less than a on
ohm! (Moral of the story: Use thick wire or tube for short antennas!)

>lack?

I can't help but believe this discussion must eventually lead to optimism
vs. pessimism, positivism vs. negativism, or good cheer vs. anger....
I tend to think of hams as generally optimistic, in that they are in
favor of communication as a means for shrinking the Earth and overcoming
political boundaries. Count me as an optimist, in agreement with Brian
Kantor's opinion above.

(mail direct to user failed with unknown PID in alias for the username)
Whilst driving on Interstate 70 over Thanksgiving, I passed a TIS
which was advertised just before getting to a particular rest stop.

According to my map, the rest stop is shown between exits 35 and 42, and
is located near Myersville, MD. It is between Fredrick and Hagerstown
Maryland. Might this be the "unknown" station below (it broadcasts on 530,
but I didn't listen for call -- maybe next week when I again pass that way...):

> MD: TIS, location unknown

Dube Todd writes --

>Are you telling me that every person who has a phone can then communicate with
>ANYONE else who has a phone, safe in the knowledge that NO ONE else can decode
>and thus monitor his conversation?
>I'll eat my posting when you tell me how this is done, John.

For an excellent overview of how this sort of thing is done, CURRENTLY,
I suggest the May 1988 issue of the Proceedings of the IEEE. Any
University library should have back issues, I'm certain they should be
hanging around TI (where Dube apparently works) as well as better public
libraries. In particular, Whitfield Diffie's article The First Ten Years
of Public-Key Cryptography, which explains how the Motorola STU-III
secure telephone works, as well as other devices and concepts.

If you accept that DES is "secure enough", as an example, the only real
problems are transmission of digital data over a voice link at an
acceptably high rate for human speech, and exchanging the DES keys.
The details of secure key exchange, even in plain view of an eavesdropper,
have been solved in several different ways. See the article for details.

It does require a different telephone than you've got, mainly in that
you need D/A and A/D conversion, high-speed modems, DES chips, and a few
other "smarts", but it is in current operation in the government arena.
Has been for several years. And digital cellular will already have
just about all that's required.

Bon apetite!

Jeepers, all this started because I asked a question. At no time did I claim to be an authority nor did I claim to have any "police" powers.

> In the case at hand, with respect to compression, anyone working in the
> field
> knows that standard compression methods are NOT encryption, just as the

You don't read too carefully. I never was asking about encryption. All I asked was what bearing does the FCC rule that on HF we should not transmit ASCII characters that aren't in ITA #5 have on compression methods that produce ASCII characters not in ITA #5. Personally, I don't see why that's not a valid

question.

4878. Re: 6 meter DX

Newsgroup: rec.ham-radio
Date: 1989-12-18 00:33:19 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <8912180033.AA08282@cmr.ncsl.nist.gov>
Source record: 14643

OM Chen reports hearing JAs from the SF Bay area on 6 meters. From what I gather from this distance, this has been a almost-daily occurance for the last moth or so. We are near the peak of the sunspot cycle and F2 layer ionospheric propagation really gets to rather high frequencies when the sunspot numbers climb. Other almost-daily DX on 6 is New England to Europe. For the past couple of weeks we have had at least a few Gs nearly every day -- I've also worked Japan and Hawaii this December. Not quite with a "wet noodle" though 150 W out to a 6 el beam at 50 ft, SSB. The last week we have had transcontinental openings to southern CA most afternoons.

The key times for this DX require that the sun be sorta overhead at the path midpoint.

Listen to 28.885 MHz for the very active liaison frequency used by the 50 MHz crowd.

> Are weather FAXes available for anonymous FTP?

I've considered writing a daemon to serve up to the minute WEFAX images to anyone on the Internet (what the hell... I might as well start collecting ham related daemons 8-) And a while back someone posted saying they were working on a greyscale FAX decoder that connected to an RS-232. I asked if I could get one asap, but never got a reply.

I guess what I'm saying is if I can get the right equipment at a low price, I'm willing to write the code to serve out the data. Anybody willing to help out?

In my opinion, the Internet isn't being used to anywhere near its full potential. We definitely need more servers like this.

> dipoles (windom in the case of Garant) with 'magic' matching networks.

If the B&W model is the one that used to be called "the Embassy model", it works by putting a fixed resistance across the far end of the line. If you can tolerate 3 or 4 db. power loss, it works.

> Does anyone have any experience with one or both of these things?
> Alternate
> antler theories will also be considered.

An antenna expert who lectured at a MARS convention I attended once said this:

"The simplest way to solve most multi-band antenna problems is to put up the longest wire you have room for, break it in the middle with a ceramic insulator, feed it with 400 to 600 ohm open wire line, and correct matching errors at the transmitter output with a tuner. It isn't elegant as theoreticians measure things, but it works."

I tried it, and he was right. It works great. Best bang for the buck I ever found.

Though my AM car radio is rather sick, I have noted a substantial number of TISs in Maryland. Our publicity-hound governor is great on such things, and on dynamic signboards ... especially in his "Reach the Beach" program in the summer. Unfortunately the information they contain seems nearly useless. The TIS here on I-270 is updated WEEKLY and tells you to call the AAA for more info!! The TISs I heard on the Eastern Shore on a weekend also had stale info. There is a "dymanic signboard" on US-50 between DC and Annapolis each summer. All but one of the times I have passed it (nearly every Saturday), it has given a toll-free number to phone, and no other info.

I don't think the TISs give callletters.

> So why do they require signal reports in contest exchanges?

For the same reason that packets begin with synch tones -- to
get the sender and the receiver in step. When you are trying to
copy a weak exchange, the moment you hear the 5NN (on CW) you
know that the next thing coming is the number you've got to copy
(depending on the contest).

>Alley to get a good score.

You can say that again. Stu had a peak hour of 235 qso's with europe on 28.887 including many european novices and technician class callsigns. A surprising number of stations told him "first USA contact ever". You will find that most of the world class operators spend very little time fighting over frequencies, and a lot of time high in the band avoiding QRM.

There is so much more activity from Europe this sunspot cycle that DX tests are turning into 48 hour sprints. A winning singler op in 1980 needed about 2,000 qso's. Today 3500 wins it. In our multi-single effort in the CW CQWW, we (K1AR, K1GQ, KC1F and K1EA) averaged over 100 per hour for the first 28 hours...

Kenneth:

Again, thanks for having posted the mods for the TH-x5ATs here.
The '75 seems to be the simplest to modify. All that is required
is:

1) Open the case (this requires the removal of 5 screws {*if* the
front half will come off} or 9 screws {if you also have to remove
the back half of the case}).

2) Look inside the front half of the case...you'll find a PC board
with a lot of SM devices and *one* green wire.

3) Remove the green wire.

4) Put the radio back together.

This allows out-of-band operation only. I'm still interested in any
other mods that may be possible, especially cross-band repeater func-
tions and such.

I didn't *really* think it'd be easy to re-tune the PLL (are we
really discussing a VCO or VFO here?) to operate in the 220MHz band,
but it does make for an interesting thought-project...

4890. CAT error in FT736 manual

Newsgroup: rec.ham-radio
Date: 1989-12-18 16:29:41 UTC
From: gopstein@soleil.UUCP
Message-ID: <875@soleil.UUCP>
Source record: 14663

The specification for the CAT connector in my Yaesu FT736R manual is completely wrong. I spent half of my weekend with a PC, scope, and various interface hardware trying to get the PC to talk to the radio. It turns out that the pins are incorrectly labeled in the manual!

After guessing the proper connector configuration, I can now control the radio. Has anyone used CAT on the FT736? Are there commands other than the ones that are listed in the manual?

If you want a copy of the correct pinout and the interface I used, send me mail.

Rich, KD2CQ

Message-ID: <18.Dec.89.16
Source record: 14659

Contests and QRM: I admit that personally i do not take part in contests, but have no objection to sharing the bands with those who wish to go chasing squares/counties/countries/states. Surely the application of a bit of 'give-and-take' will solve the problem! What does make my hackles rise is when a contester suddenly decides that he has some 'right' to occupy a frequency that you are already using. Now i accept that the vagaries of propagation may mean that you may only be able to hear one 'end' of a QSO, but surely it is only 'good manners' to ask if the frequency is in use before grabbing it for ones own use.
To decide to 'occupy' a frequency without asking is rude, inconsiderate, and shows nothing but the small-mindedness of the person doing so. Operators who ask if a frequency is in use may, on occasions, receive a resounding 'YES!' in which case they *should* go elsewhere.
Those who do not cannot complain when they find 'their' frequency 'stolen' by someone else. Only he who is without sin should cast the first stone.
Much of what is heard during contests does nothing to further the image of ham radio. Remember, the commercial spectrum-grabbers are listening all the time, just waiting to poach our bands for themselves!
When the commercial users hear a typical 20 meter contest, it can serve only to reinforce their image of hams as providing little of use to anybody, and using up commercially valuable spectrum-space.

I am sorry to send this to the whole group but every mail attempt I
try fails.

To MROWEN at stlawu:

It is trivial. You must fire a intel 8086 interrupt. In "C"
this function is called int86()

I remember there being a function like this in Turbo Pascal (BLEECCCCHHHH,
learn C!!!!!, Turbo C is great!) . Tell me what it is, the EXACT
details on the arguments and I will give you an example of how
to use the interrupt service routine that sends commands to KCT.

>the mouse for just about everything, or stick with the keyboard and
>various c- or k-shell like interfaces.

[blush] Now I AM embarrassed. How could I have forgotten Amiga?!
AmigaDOS supports multi-tasking 'out of the box'. Amiga gives you full
power in either windowed or CLI environments. And, if I recall correctly,
KA9Q has already been ported to it.

Does anyone make a UN*X for Amiga? That would complete the picture.

Almost all contests are restricted to particular portions of the bands, either by rule or by practice. The 10 Meter Contest is an exception in that contest QSOs are allowed in any part of the band. However, even during these high sunspot years I don't think I have heard much contest activity up past 28.9 MHz, so there is still plenty of room for everyone to get on and "do their thing."

4901. Modifying Commerical Radios for use in Ham Bands

Newsgroup: rec.ham-radio
Date: 1989-12-18 21:32:11 UTC
From: wa2sff@cbnewsh.ATT.COM
Message-ID: <6704@cbnewsh.ATT.COM>
Source record: 14678

I recently saw an Ad for a Marine Store that listed Marine Hand Held units
for about $150.
The unit used thumb wheel switches to select the channels.
The unit seemed similiar to Hand helds of a few years ago.

At $150 (about 1/2 the price of cheap 2 meter Hand held), it might be
appropriate to use as a second hand held or for a new ham just starting out.

I could see that maybe it would only transmit simplex and there could
be other problems.

Two meter FM got its start by modifying surplus 150 MHz gear to 2 meters.
Two of my many 2 meter rigs over the years were done that way.
Also both the 2 meter and 440 repeaters I put on the air were surplus.

Has anyone tried this with Marine radios or cellular telephones?

Let's get some useful "out of band" modifications going.

> In a few magazine articles I've seen the terms 'near field' and 'far field',
> but I can't find any mention of these terms in any of the radio or
> electronics texts I've tried. Can anyone define these terms?

Near and Far fields are usually used to indicate the type of fields present around an antenna.

The reactive near field refers to the region immediately surrounding the antenna. This is the region where the reactive components on the antenna predominate. This distance is on the order of a few wavelengths or less.

The radiating near field is that region where the relative angular distribution of the field (i.e. the radiation pattern) is dependent upon the distance from the antenna. This is due to contributions to the field from different elements in the antenna, as well as the amplitude of the fields, changing with distance from the radiating source.

The far field is defined as the region where the antenna radiation patterns are independent of the distance from the antenna. This distance is roughly defined to be D ** 2 / (wavelength), where D is the width of the equivalent aperature, uniformly excited. When you see an antenna pattern diagram, this pattern is usually defined to be in the far field.

As a good general reference on antenna theory, I'd recommend Antenna Theory: Analysis and Design by Constantine Balanis, or Antenna Handbook by John Kraus. The ARRL Antenna Handbook is another good source.

if you are blessed with reading this as a Usenet newsgroup and have the
'rn' news reader, you can Kill any discussion you don't want to see by
subject, and by author. For example, this is my Kill file.

```
/:.*for sale/:j
/Jim.Grubs/h:j
```

The first disposes of any article whose subject line include 'for sale',
and the second flushes anything posted by or about Jim Grubs.

Selective reading is the answer. Trying to keep people from posting
will never work.

4906. Getting serious about building.

Newsgroup: rec.ham-radio
Date: 1989-12-18 22:28:32 UTC
From: henry@ginger.sri.com
Message-ID: <7026@unix.SRI.COM>
Source record: 14692

Please forgive my previous ramblings. Lacking any gear, I thought it might make an interesting challenge to build some of my own. Two projects come to mind:

1) A synthesized 2 meter FM transceiver.
2) A low-band HF receiver / transmitter pair.

Either project would do. If it's the 2 meter rig, I want a compact base rig with ten watts. If it's the low-band radio, I want to start with a basic double conversion receiver design in modular format so that I can later build it into a full-blown multi-band radio. CW only on transmit is fine for now, with a hundred watts or so of input power. Quality is the key, and money may not be an object.

I have seen a few people ask for help on such projects, but no follow up. I have the means to do this project on my own, but I am interested in contacting people with experience in advanced RF design, so that I don't have to reinvent the wheel.

I anticipate a certain amount of "If you're a beginner, why not go buy a quality used rig and save a lot of money" comments. This is not my intent. I am not a beginner, I know how to build equipment, and I want to get some hands-on experience with RF stuff. I am imagining the satisfaction of building an unpretentious HF CW rig with a hundred dB two-tone dynamic range and a six dB noise floor.

Comments?

-Henry

CDE rotors were sold to Telex corp. a few years ago. I _think_ they're in Nebraska (where they took over the antenna operations of the bankrupt HyGain Corp. some years ago, along with that name). Telex is a fairly big conglomerate, so it's possible they still have a rotor plant in CDE's old hometown (Fuqua-Varina, North Carolina) but since my rotor is an old CDE too, somebody else will have to give the current address...

> as having "criminal intent".
>...

I disagree with that analysis. The ECPA says that you can listen to things
that are "readily accessible to the general public". Obviously that's a
matter of interpretation. One interpretation, which is the one I would use,
is that anything that can be bought for less than a thousand or two, or that
can be built in a reasonably equipped hamshack, is "generally accessible".

By that reasoning, a "coding system...however simple" would not necessarily be
protected. If it takes more skill than you can get from reading "The
Codebreakers"
and "Cryptologia", or more money than it takes to buy an IC-781, then I would
agree you might have a solution. Of course, it is trivial to do GOOD
encryption,
so why would anyone in his right mind want to do poor encryption?

You don't have to be around very long on HF to hear calls like this.
I heard CT500D on a couple of bands recently, and yes, it's Portugal,
celebrating 500 years of something or other. The USA used W200 calls
for a year for a similar reason, LX150D was a recent Luxembourg station,
TU29 stations were all over the place recently for 29 yrs of something
in the Ivory Coast, Brazilian stations were signing /PR100, Paraguay had
ZP450-something, Nigerians were using 5N29 and so on.

It's probably worth sending them a card through the bureau at least,
they tend to have 'special' cards for these occasions. I guess they are
pretty useful for those souls who chase prefix awards, and you can probably
get a DXCC's-worth of these 'funny' calls in any year.

Pirates usually choose more conventional calls (with some rather notable
exceptions) - an intermediate example is the ever-popular RG8U... So if
you hear a 'funny' call, you might as well work it and sort it out later.

Happy DXing in 1990 -

Thanks!

>A couple of comments though...

>2) I can appreciate the space saving aspect of the design, but you get what
> you pay for. I don't think you can do better than a full length antenna.

I'm not trying to do better, just almost as good ... I don't have alot
of roof area and I'm hoping to come up with something small and not too
ugly so my spousal person will let me put it on her house :-) ...

I first became facinated with helicals when I was living in a Mobil Home
and absolutely HAD to have a very small size antenna. I plan to put up
a 31 meter folded dipole on the roof as a real reference antenna and
make a couple of vertical helicals wound on 2" PVC pipe. The 4" PVC
pudgy wound helical was an idea that had first started nagging at me
when I was in the mobil home and only had 48 inches of vertical space.

Unfortunately I didn't have the money then to buy an antenna bridge or
other resonance reporting tool. For helicals you must have some way
to measure resonance. (At least, I have found no published formulae
for calculating it for a helical; they all say 'cut to resonance'
as indicated on {some gadget}.) The published designs all tended
to be wound on 1" to 2" forms and were 15 to 30 feet tall. I kept
wondering what would happen if you made a pudgy helix ... now I know.
(At least, I've started finding out ...)

> To capture the most energy you need as large an effective aperture as you
> can get. However, I have no doubt that you can do better than your window
> antenna (which, I admit, do work remarkably well).

What is 'effective aperture'? Is it just length? Or some product
of length, width, etc?

My window is most annoying. It works far better than it ought. I
don't know if I should curse it for being such a damned puzzlement
or be thankful that I have such an effective free antenna ...

>3) Helical designs are most effective when the diameter is one wavelength or
> more. This makes it radiate in its axial mode which gives it some directive
> gain (not too practical at HF).

Where does one find such info as 'most effective when diameter is one wavelength'? Should I be visiting the Engineering library rather than the Ham Radio store book shelves? I am familiar with the ARRL published design for a UHF helical array with directivity off the end ... but there seems to be rather little published on HF helicals theory.

>I would dearly love to see someone come up with a compact antenna that performs
>as well as the big ones, but I think we're up against one of those doggone
>physical limits here.

One interesting quirk of pudgy wound helixes is that, being so compact, you could make an array out of them. Yup, you loose a little signal on each antenna, but make it up in volume ;-) Now if only I had some way to figure what the directional behaviour was likely to be ...

>Keep up the good work.

Thanks again! I hope that it is 'good work' and not just pointless bumblings by a 'rank amature' ...

A newsgroup called rec.ham-radio.legal might help a little by occupying the time of arm-chair and on-air lawyers. If not that, at least you can feel good about posting "hey buddy... this belongs in rec.ham-radio.legal".

I happen to think it might be useful. And we can also send all the no-code postings there as well.

Its no problem to broadband match to a dipole fed with parallel open wire line (450-600 ohms) if you use a decent antenna tuner. I have a G5RV that I can match from 80 to 10 meters. One small complication is that the transmission line needs to be "tuned" to put the impedance within the range of the tuner over the different bands. Since a good tuner has a fairly wide tuning range, its not hard to find the magic length empirically.

The problem with this approach is that the radiation pattern varies all over the place. For a full wavelength dipole or shorter, the pattern is the usual toroidal shape. As the wavelength gets shorter, sidelobes develop that rob power from the main lobe. Maybe this is desirable, maybe not.

Since at HF most of the noise is atmospheric, it seems to me that you want to have a low angle of radiation. A dipole is lowsy in this regard since you pick up noise from the sky directly above you, but you dont find many useful signals there. Either a vertical or yagi improve this problem.

Another design that should work well is a horizontal loop where the circumference is less than a wavelength at the higest frequency of interest. By changing the configuration of the side opposite the feedpoint from being shorted to open, you can change the direction of maximum radiation.

True and another reason why a small diameter helical antenna is worse than
a simple vertical of comparable height and wire size.

"QSL" can be a question or a promise. It's proper use is in code communications where a question mark removes any ambiguity. I suppose the inflection of the voice in voice communications is supposed to take the place of the question mark, but during contests that isn't even needed since both guys know what to expect, anyway. What is funny is that the guy asked how his signal was after getting a signal report (perhaps this was the point of the original posting).

"QSL" really means "acknowledge" I believe. That's why it is used much like the CB tern 10-4 at times. So N3xxx's QSL really meant that he had received and was acknowledging KH6xxx's transmission. I suppose he should have asked "QSL?" if he wanted a card, too. Which would properly have been followed by a "QSL" from KH6xxx.

There used to be a ham radio fraternity called "Synton". It was 'mortally wounded' by WW2 but a handful of chapters lingered feebly until the early fifties. So far as I know, the only surviving evidence is the former University of Illinois (Urbana-Champaign) chapter, which to this day is called the Synton Radio Club. That last I heard, they have no written records of their history.

Perhaps past issues of QST would help. Surely there were references to college ARC's.

Message-ID: <8912190559.AA23503@apg-tecnet.apg.army.mil>
Source record: 14691

In regards to a recent posting I have been accused of putting words into Dube Todd's mouth....amoung other things. :-) Below is what was said:

*The only person giving you support is Dube Todd
*who was another person that went off trying to say that someone was breaking
*the law by asking for military daily use callsigns. He happened to be wrong
*but "his heart was in the right place" right?

And Dube Todd replied:

>Mark Bitterlich's comment, "....Dube Todd who was another person that went
>off trying to say that someone was breaking the law....." deserves retort.
>First of all, I made no mention of breaking the law. Perhaps Bitterlich
>ought to pay more attention to what he reads here. Secondly: I usually
>say what I mean; I don't "try to say". What Mark is flaming is what HE
>READ INTO what I said. So don't put words into my mouth, buster. If you
>want to discuss the issues, fine; but don't put up your own agenda and
>attack it as mine!

However here is the exact quote from Dube on the subject:

>In article <8911212358.AA17672@ti.com>, dube@cpdvax.csc.ti.com (DUBE TODD)
>writes:
>Several people have correctly cited the freedom to listen to any radio
>communications. I support that. However, Balinski asked about the aircraft
>home base, etc. While the radio transmissions he heard were obviously
>unclassified, the association of the call signs with aircraft type, unit
>of assignment and home base is classified information.
^^^^^^^^^^ ^^^^^^^^^^

So you are correct Dube, you never said anything specifically about breaking the law, you just inferred that the release of unit callsigns for military aircraft is a security compromise when associated with the name and homebase of the unit. However, I hope that you would agree that the release of classified information is considered to be "against the law", which is what I was talking about.

By the way, to answer the above question once and for all. I personally checked with unit, Group, and Wing activities in this area and they informed me that daily use military aircraft callsigns are not classified and they do in fact respond to QSL cards (if sent with a SASE). If anyone needs a phone number to call to verify this, please send me a message. I informed Dube of this with personal email. Unit Public Relations Officers are the point of contact for getting QSL's from a particular unit. They are not REQUIRED to respond to you, but they are allowed and in some cases encouraged to do so.

I said that Dube supported Jim Grubs. I got that impression from the
following posting.

>From: dube@cpdvax.csc.ti.com (DUBE TODD)
>Subject: Packet compression
>I believe that every Ham should be concerned
>about the use of any methods or techniques that might work against the best
>interests of the hobby. And I DON'T think we should try to palm off the
>responsibility to the "Big Brother" we are all so afraid of. If the
>compression technique works within the established rules, then there's no
>problem; if not, then Jim has every reason to be concerned, as do the rest
>of us.
>Dube Todd, N5PDK

If you want to get right down to it, I do not agree with Dube on
worrying about new techniques or methods that might work against the
best interests of the hobby. In my short 23 years as an amateur, I
have noticed that the introduction of every new development and mode
has been met by some with suspicion and worry about "what it might do
to the hobby". But I have never seen the service actually threatened
by advents in technology or by the use of new and/or innovative methods.
Most of the rules concerning these new modes were made AFTER the new mode
was developed. To do it the other way around would mean that the FCC would
have to invent EVERYTHING.

I believe that every ham should avoid being "concerned" but should
instead encourage and contribute TOWARDS new methods and techniques,
and should not immediately look for possible rule infractions before
the idea has even jelled. I believe these worries (and others) are
very premature and in some cases counterproductive.

I think every Ham is the U.S should send two to three minutes of 'noise',
just to piss off the N.S.A trying to decode these 'transmitions'. :-)

I was just wondering why the crypt/makekey stuff is 'under the control of the
United States Government and cannot be exported without special licenses.'
As if any government hostile to the U.S would trust D.E.S.
Why does this kind of thing exist?
Would somebody please explain to me why this is so.

It is a pain in the arse for people who live outside of the U.S, who want to
use unix features like dial-in passwords etc.

p.s I know there are work-arounds for these things, but It's still a pain.

4920. CDE Rotators

Just noticed I left out a factor of "2" in the equation for determining the boundry between the near and far fields; the correct equation is:

2(D**2) / (wavelength)

Sorry for the error.

4923. Packet compression, what issue?

Newsgroup: rec.ham-radio
Date: 1989-12-19 15:18:09 UTC
From: wwg@brambo.UUCP
Message-ID: <8912191018.AA19396@brambo.UUCP>
Source record: 14684

The whole idea of PREVENTING or legislating against data compression, is already and will become even more rediculous, as time wears on. Look at the present situation:

With packet, what prevents me from sending *.ARC, *.ZOO, *.ZIP, *.LZW, *.PAK, *.GIF files that are possibly further UUENCODED or BSQed? Furthermore, consider the aspect of sending a program *.COM or *.EXE, which could include secret messages?

One could argue that it is not encrypted, except when the encrypt features of some of the archive utilities are used. Even without encryption, what use is it to monitor the traffic? Unless u get all of the data, intact, you cannot run the programs, and in many cases will not be able to de-archive the arc files! So monitoring is useless there.

If I send a picture in *.GIF format to a buddy, what prevents me from including a message in raster image format? Nobody else will likely see it, unless they were able to receive the entire file error free (monitorers can't ask for retransmits). Even though its a raster image, it uses modified LZW, so the entire file must be had, to decompress the image.

So folks, if the government takes issue with data compression, then a lot of us are already in trouble. If the govt enforces a position against this (note that I have not said this is the case), then we are going to go back to the stone ages in packet radio... exchanging basic programs perhaps!

I have not checked into it here in Canada, and I'm not sure of the American issues on this either. But I'd be surprised if compression of data is an issue to them at all, in the final analysis.

Can anybody explain what a "dweeb" is? It's not listed in my
American Heritage Dictionary of the English Language.
Although I can infer a definition from the context in
which it's used, I prefer to have a precise definition.

Then I'll be able to use it to describe those who use
such expressions to describe others who venture opinions
that differ from their own.

Let's try to be civil. Ham radio is supposed to be a
recreation, not a religion.

Henry:
A couple of suggestions; first get a-hold of _Solid State Design
for the Radio Amateur_ by the ARRL, and possibly their book on
VHF/UHF construction techniques. I got mine from Amateur Electronic
supply in Milwaukee, they have several locations as well as mail-
order service. Second, make friends with someone who owns a
spectrum analyzer and possibly a sweep system. Ours is real
handy for that after-hours government work. Third, be prepared
to spend a LOT of time. I've played with cohn-type ssb crystal
filters for two years now, (making test jigs, building signal
generators with extremely fine tuning controls, building
broadband scope amps, writing computer simulations, debugging

computer simulations, rewriting computer simulations, running
computer simulations, sweeping the crystals to determine their
characteristics, rerunning the simulations, re-sweeping the
filters, etc.) and that's only a small part of a HF rig!
I've yet to run speech through one of these things to actually
determine what they sound like, but hopefully I will soon.
Til then 10 meters is fun on the club's Kenwood, even if I didn't
build it myself. Fourth, find someone who either has done this
before, or is interested. I've never met someone who has done
something like this, although K9MA has built our club linear.
I have an swl friend who is interested, and it's fun to work
on something with people. Fifth, either locate some good parts
sources or be prepared to spend a lot of money. (I do both)
Sixth, locate some good amateur technical literature. I like
QST, since it's available at the engineering library here at
the UW. So there you have it; time, money, knowledge, contacts
help, and equipment. Any three should suffice (I think)

However reasonable your interpretation, it really doesn't matter. What
matters is how the case would be presented to a jury of "your peers*"
in a court of law where you would be prosecuted.

Think about it in that light and you may want to change your interpretation.

Ron Miller
NW0U

* "your peers" generally winds up meaning citizens chosen for their
availability and specific lack of knowlege in any pertinent area
of your case. After having been disqualified from jury duty in
a case where a young man flew an airplane into power lines and was
suing the electric utility for damages, I saw that being a pilot,
an electrical engineer and a former Naval Officer (????) totally
disqualified me from being a juror. The little old lady who
doesn't know three-phase electricity from a solar eclipse was who
they kept.

Just a quick point about IDing. The 10 minute/end of every contact rule
is an FCC rule. This means it applies to us, not the DX stations. They
may have similar rules(I don't really know) Your comments are certainly
appropriate for US stations but don't necessarily apply to other countries.

The two knobber is probably an L network which can, in addition to resonating the antenna, transform a high-impedence to a low (or visa-versa if you reverse the connections). The three knobber is probably a pi which can resonate as well as perform impedence transformations in both directions without requiring re-cabling or internal switching.

A "true" long wire (>= 1 wavelength) will have an impedence > 50 ohms and as such an appropriately connected L will suffice. The three knobber you refer to probably has those extra "inputs" with connectors, switch positions, etc as part of function packing to raise the price point up a bit.

> time flies for you--HAVE FUN ON THE AIR!

For a different response--

Let's not impugn the FCC so unfairly! The problem both you guys are having is with your VEC, not the folks in Gettysburg. I'm a VE with the Sunnyvale, Ca. VEC, and I guarantee you that the FCC is utterly predictable. We give our exams on Sunday, and the successful candidates get their tickets EXACTLY 29 days later--in Monday's mail. Now it is true that we express mail all of our 610's immediately after the exams, but then we feel we're here to serve!

Now it is known that the ARRL VEC has a nasty habit of sitting on the 610's before sending them in, and people here locally who took their exams with the ARRL end up waiting ABOUT six weeks. But it's not the FCC's fault.

Another thing I would mention in this regard is that the VEC cannot mail in a 610 if there is a license application pending with the FCC. We will hold them until the application on file has been processed AND a photocopy of the license sent to the VEC. Sunday we had a fellow who had passed his general exams with us on 12/3, then his advanced class with the ARRL VEC on 12/10, and was successful on his extra exams on 12/17. We estimate he will get his general ticket in the mail on January 8, then send it to the ARRL. The ARRL might send off his advanced application by January 22, and he can get that

ticket back by February 19. If he gets a copy of that to us right away, we can process his extra class paperwork in time for him to get that ticket by March 19 at the absolute earliest. Get the idea?

doesn't seem the same. I wonder what I will find if I >probe further. Is
amateur radio still worth my while?

Two comments: First - I am of the class you call 'appliance operators'. I wonder - do all hams have to be electrical engineers or build their radios and equipment from parts to qualify as a 'real ham'? I find that I just enjoy chatting with folks not from around here and generally satisfying myself that I know enough about radio to operate. I resent the appliance operator label in how you are applying it. Don't get me wrong - I have a lot of respect for hams that know more than I do, and your listed accomplishments are something you are obviously proud of - with good reason. Which brings me to point number two:

You're right! The hobby isn't the same! I let hamming slip by the wayside, and returned to see packet in full swing. Now who could get a thrill from having a computer operate the rig and do the same thing that you can do over the local BBS or Hamnet in CompuServe, or even here? But slowly, I find there is yet another new facet of ham radio evolving - and I want to learn it. Things will never be the same, as it has been changing for years! The bad things (crummy ops, jamming, 2 meters, etc) will always be around, but >I< think you should 'come back'! There's an incredible amount of incredible (to me, anyway) things being done in amateur radio today.

>Barker and Williamson AC 3.5-30, and the Garant GD-9. Both are long wire
>dipoles (windom in the case of Garant) with 'magic' matching networks.

I have (had) a B&W 3.5-30 MHz antenna, which was essentially a trapped dipole. I had it set up as a sloper, and it worked reasonably well, considering I didn't take time to tune the various segments as per the instruction sheet. One evening I noticed it was no longer in the air, and after hunting around I found the remains trailing off into the woods for a couple of hundred feet, with bits of moose hair caught in kinks in the wire. A couple of the trap housings broke, and I haven't been able to find similar-diameter plastic tubing at local building supply places, so it is sitting in a shed right now. Life is rarely dull here...when's the last time you saw a bulletin like this on your system: SYSTEM MAY GO DOWN WITHOUT NOTICE DUE TO VOLCANO.

If you have 35' vertically and want to try something really different, you could set up an HF discone as shown in the ARRL Antenna Handbook. I've thought about trying one of those...there is enough room inside to make a nice outdoor gazebo for hot summer days, if you use wire screen in the cone part to keep bugs out. In the summer, your antenna could be your hamshack...

I feel that Ken's point has been missed. Irrespective of the legal ramifications, it is considered poor operating practice to do otherwise during a contest. If the guy has a particularly impressive pileup, it's probably ok for him to save a little time by announcing his callsign after every other contact, hence Ken's "two QSO's to sign" rule.

Ken, how about some suggestions for training people to avoid other poor operating practices, such as not giving the whole callsign when answering a CQ?

> included. But, in that price range you can't expect everything.

I saw an article in one of the magazines (QST Hints & kinks??) about
a year ago that did just that. It seems that it only takes the
swapping of 2 wires inside to reverse the power and squelch controls.
If you look at the schematics, it should be easy to see. It seems
that nearly everyone who owns a '140 thinks about that within a week.
I am very nearly breaking down to the point of buying a TS-680S to
pick up on 6m. In 22 years of ham radio, I have never worked the
6m band.....with my luck I'll finally get the money for it at the
end of the sun-spot cycle......Murphy lives in my back pocket.

I have heard quite a few TS140 and TS-440 rigs on the air. They
sound great!! I never hear any complaints about them, just real
nice signals. Have fun, don't drown...

John Moore's comment that effective antenna aperture is not related to physical size for small antennas is right on. Gain and aperture are really just different ways to measure the same thing -- In fact there is an equation to relate the two: Aperture = (gain over isotropic) / 4(Pi) (I think, I don't have a reference book handy).

For example, a dipole (gain = 1.64) has an aperture of about 1/8 square wavelengths. I think of a dipole aperture as being 1/2 wavelength long (the length of the wire) and 1/4 wavelength thick. If you could make a 100% efficient, physically-small antenna with the same gain, it would have the same capture area.

The problem, of course, is that this is very difficult (impossible) to do. Radiation resistance is proportional to the square of the length (or 4th root of the length for loops!). A .1 wave vertical is around .5 ohm or so if I remember correctly, so even a tenth ohm of loss resistance gives you only 80% efficiency.

>>to find an un-contested frequency.
>
>I hope you mean 28.300 - 28.600.

Yup. Got lost. Thought CB was 28 MHz.

I think it would be sufficient for contest organizers to reserve the
lower 25 KHz of the Novice 10m band for the rest of us. Same for the
lower part of the General 15 and 20 bands.

I still stand by my statement that contests are insta-QRM generators.
The real problem is that all nets get displaced by contesters, while the
reverse is not true. I think the band is big enough for all uses -
contests, nets, and ragchewers. Do we need to talk to CQ, QST, et.al. ?

I recant. I said Marine VHF, and what you say is true. That band requires type acceptance.

However, CAP other para-military frequencies are well within the capabilities of most 2-meter rigs. I've been told that most military bands do not need the type acceptance.

Funny how the government treats itself and commercial interests differently.

4943. W1AW: Computer-generated QRM ?

Newsgroup: rec.ham-radio
Date: 1989-12-20 00:07:07 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880102@hpfcdc.HP.COM>
Source record: 14704

This is probably a re-hashed question that comes up every two years -
I thought W1AW was just like the rest of us, and aren't allowed to
QRM a frequency. If the transmitter is computer controlled, isn't
this slightly un-nice to anyone they happen to land on ?

A few nights ago, four hams on 7.290 were ragchewing late into the night.
It was particularly interesting because one was in Buffalo, NY, and another
was in Honolulu. The copy wasn't particularly good; the band QSB was
pretty bad. However, it was fun to see if Buffalo could make it to KH6.

Lo and behold, W1AW comes on with it's bulletin/broadcast. The weird
part was that nobody really heard W1AW, except the guy in Buffalo. I
was really surprised to hear him say that my speech processor and lowly
300 watts PEP could go up against W1AW anytime. I listened for a moment
before replying, and sonofagun, there it was !

I want to share the band with everyone, but it appears some stations are
more equal than others. Had a real operator at W1AW come on and asked
for the frequency, citing schedules, tradition, whatever, I'm sure
we could have moved. It's just that 7.290 is a nice frequency - no
foreign broadcast station.

I think the W1AW operating policy is rude at the least. While nets
have their place, we all operate according to Gentlemen's Agreement.
Computer-controlled QRM is about as bad as Computer-controlled telephone
solicitors.

4945. Corrected CAT Interface for FT736R

Newsgroup: rec.ham-radio
Date: 1989-12-20 01:36:26 UTC
From: gopstein@soleil.UUCP
Message-ID: <876@soleil.UUCP>
Source record: 14711

This is the picture of the 6-pin DIN connector (from the manual).
It represents the connector when viewed from the side that the
wires are soldered to.

3 o o 1
6 o
5 o o 4
o
2

The manual gives the following INCORRECT list:

1 Gnd
2 S. Out
3 S. In
4 Busy
5 NC
6 13.8v

The correct pinout is:

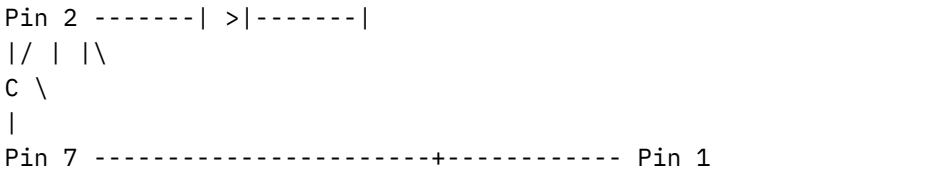
1 Gnd
2 S. In
3 Busy
4 S. Out
5 NC
6 13.8v

"S. In" is the data from the computer to the radio, "S. Out"
is data from the radio.

In addition, the timing spec for the five-byte command seems to
be in error. I started with an inter-character spacing of about
100ms -- which worked fine. The time to send a command to the radio
was about 1/2 second, which was too long to do anything interesting
like scanning. After some experimentation, I completely removed the
delay, and it still worked! It appears that the five command bytes
can be send nearly back-to-back. I haven't tested it exhaustively, but
it seems to work. With no added delay, the computer can scan the radio
faster than the built-in scanning.

The interface I used was:

RS-232 CAT
E
/------------ Pin 2
|\ | B |/



The diode is a generic, small, silicon diode. The transistor
is a generic, small, NPN transistor.

This circuit can only be used to send data to the radio, not
receive data back. For that you need an RS-232 driver chip.

I have a program to send some simple commands to the radio. It's
written in Microsoft C. I anyone wants it, send me a note.

Using a P.O. Box is good enough to conceal your address in the Callbook, but not in the publicly available data bases. I have a copy of the US Amateur file that Rusty Carruth got from the FCC. In addition to the mailing address, it contains your station address. Station addresses must be actual physical location, not P.O. Box or rural route box number, etc. In this age of computers, true privacy is pretty rare.

Does anyone know where or how someone would be able to obtain the HAM
Radio or Packet software for the Amiga? Is it in the Public Domain?
If not, can someone steer me in the correct direction to get more info
on it and just what it does. Are there any other products out there
for this type of thing besides "KA9Q" that is mentioned above?

I am interested in connecting my Amiga up in this manner but I am
currently a novice at any of this stuff and most of it makes no sense
to me at all at this point in time. (concerning the Packet connection)
Maybe someone would be nice enough to outline how you hook up a BBS to
a Packet setup and what exactly is need to to transmit and receive
messages/mail.

Thanks,

-- Bob

DWEEB -- Noun, but not a person or place, if you get my drift.

An entity which has a compulsive need for precise,
authorized definitions. Someone who needs the
joke explained. Several times. The person in the
audience who shouts "That slide is upside down!"
as if they were the only who could see it. Armchair
lawyers who argue that transmitting a fax of sheet
music is transmitting music. The person who required
that auto mirrors have the words "Objects are closer
than they appear" written on them. People who object
to Bugs Bunny cartoons because they promote violence.
People unable to think for themselves and unwilling to
let others think either. A generic class of individuals
who don't have a clue that they don't have a clue.
Useage is generally considered somewhat pejorative.

4952. Portable scanner review - Uniden/Bearcat 200XLT

Newsgroup: rec.ham-radio
Date: 1989-12-20 14:05:50 UTC
From: parnass@cbnewse.ATT.COM
Message-ID: <12257@cbnewse.ATT.COM>
Source record: 14726
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Somebody asked for recommendations for a portable scanner. My e-mail reply bounced so I will repost an earlier review of the Uniden/Bearcat 200XLT, the model I prefer:

UNIDEN/BEARCAT 200XLT SCANNER REVIEW

by Bob Parnass, AJ9S

For a long time now, radio enthusiasts have awaited the arrival of a decent portable scanner with 800 MHz coverage. Users had grown accustomed to the good sensitivity and reliable performance found in portable models without 800 MHz, like the Uniden/Bearcat 100XL, the Azden-manufactured Regency HX1500, and GRE-manufactured Radio Shack PRO-30. Unfortunately, early 800 MHz models, like the AOR-manufactured Regency HX2000 and HX2200 were disappointing.

Now, the wait for a good 800 MHz portable is over, because the Bearcat 200XLT is here and it's a winner.

Physical

The new Uniden/Bearcat 200XLT is manufactured in Taiwan, and looks identical to the tall, gray 100XLT.1 The case is entirely plastic, and the battery and charging circuitry is contained in a slide on pack. The differences between the 200XLT and the 100XLT are in 800 MHz band coverage and number of channels (200 vs. 100).

The "real" volume and squelch knobs on top have a positive feel, and there is little play in the squelch control.

The closely spaced keys on the 200XLT keyboard are made of soft rubber, and are well labeled. Marshmallow-like keys, combined with fat fingers, require extra care when entering frequencies. The lack of a "beep" tone to confirm key depressions, and the slight amount of tactile feedback, makes it necessary to watch the display to ensure you pushed the keys far enough.

Memory Organization

As with the 100XLT, the 200XLT's strong point is the amount and organization of its memory. The 200 memory

channels are divided into ten banks.

Memory banks and channels may be selected or locked out. The banks are "hard partitioned," just like Bearcat scanners of old. By this I mean, Bank 1 includes channels 1-20, Bank 2 channels 21-40, etc. Regency used "soft partitioned" banks in their HX1500 and TS2 models, but the peculiar Regency system prevents channels from being locked out during a bank scan. Now that Uniden bought out Regency's consumer line, the soft bank concept may die with the current Regency models.

The large channel banks do have their place, particularly when scanning 800 MHz trunked systems and cordless phones.

Banks aside, having 200 channels means no longer having to settle for 10 or 16 most favored frequencies when away from home. Now you can bring it all with you. My 200XLT banks are programmed with frequencies for different situations:

- Bank 1: 20 of the most important frequencies for local sheriff, fire, ham repeater, plant security, etc. I usually scan this bank unless I'm hunting around for something else.

- Banks 2, 3, 4: Government frequencies by agency.

- Bank 5 contains VHF-lo and VHF-hi low power and itinerant business frequencies. Bank 6 contains similarly allocated UHF frequencies. I scan these banks when I'm at a shopping mall, fair, sporting event, or anywhere else I see walkie-talkies in use.

- Bank 7: Just the frequencies I want to monitor while in the office.

- Bank 8: Police, fire, and emergency services for other communities in this part of the state. There's almost always something happening on these channels, even in the wee hours of the morning, when my county is asleep.

The remaining banks leave 40 channels just for trial-and-error searching!

The 200XLT scans at 15 channels/second, about twice as fast as Radio Shack's top of the line PRO-32 handheld. When the 200XLT is powered on it always comes up scanning with priority off.

The LCD display panel contains all the usual indicators, and can be back lit for 15 seconds with a green light

when the proper button is pressed.

Innovations

Both the 200XLT and 100XLT feature set include new surprises. The first channel of each active bank is a priority channel, making 10 priority channels in all. There are 10 levels of priority. For example, channel 1 priority takes precedence over priority channel 11, which takes precedence over priority channel 21, etc. When the priority is switched on, the 200XLT samples all the unlocked priority channels (in active banks) every 2 seconds.

I program the first channel of each bank with the most important frequency for that bank. The priority sampling does appear to "chop up" signals a little more than on older models that sample only a single priority channel. When the power is turned off, then on again, the priority key must be pressed manually.

Let's see, did I program in that new K-Mart frequency, 154.6 MHz somewhere? Just type 154.6, ENTER when positioned to a channel you don't care about, and the LCD will display "CH 29", for instance, if you already have 154.6 MHz in channel 29.

Stated a different way, if one tries to type a frequency into the 200XLT that has already been programmed in another memory channel, the display will flash the channel number in which the frequency has already been programmed. One can override by depressing ENTER again, and the frequency will be stored in the current channel.

This "query" feature is great - especially in a scanner with so much memory.

There is a single button to search all VHF NOAA weather channels, a feature now commonplace on newer UNIDEN scanners.

Battery Pack

The 200XLT comes with a BP-200 7.2 V Sanyo battery pack which slides onto the bottom of the radio. There is a charging jack, marked 12 VDC, and a red charging LED on the back of the pack. The pack is not supposed to be opened, but the curious need only remove 2 screws. Inside, are the charging components (regulator circuit), and 6 AA size Sanyo cells wrapped in yellow heat shrunk plastic.

The BP-200 battery pack has a 600 mAH capacity, whereas the BP-205 (supplied with my 100XLT) contained batteries internally marked 550 mAH.

When you buy the 200XLT, the 16 hour wall power supply is furnished, and is marked 12 VDC 500 mA. The wall unit is not a charger - the regulator/charging circuit is actually inside the battery pack and uses the 12 VDC furnished by the wall power supply for charging the NiCds at 60 mA. Since the 200XLT draws about 60 mA while scanning (while fully squelched), the batteries will not be charging if the scanner is on while the power supply is connected. To deposit a net charge into the batteries, the radio must be turned off.

The radio can be used with the wall power supply when the batteries are dead, but unlike older crystal controlled portables, there is no easy way to power the scanner externally, while effectively charging the internal battery. Neither is there a way to fast charge the supplied NiCd pack, and the manual cautions against leaving the supplied power pack plugged in for long periods of time (I assume Uniden means with the scanner OFF).

A PS-001 mobile power cord is available for $4 from UNIDEN, as is a spare antenna.

The owner's guide says to expect "up to 5 hours of dependable use" between charges. Now 5 hours isn't enough for many scanner buffs, but perhaps UNIDEN's idea is to stimulate demand for extra BP-200 slide-on battery packs. My 200XLT was used for about 7 to 8 hours before the battery indicator began to flash, but Dan Doyle reports he gets only 5 hours between charges. It is the audio amplifier stage that draws the most current, so battery life is dependent upon channel activity, and the volume control setting. Using an earphone, which draws less current than a speaker, can mean longer battery life.

Great Audio

The audio output is rated at 480 milliwatts. As with the 100XLT, the 200XLT audio sounds great! There is plenty of undistorted audio available from the front speaker, making a Radio Shack PRO-30 sound like a whisper.

Inside Construction

The internal construction of the 200XLT is clean, but thoughts of home repair vanish as soon as one opens the 200XLT case. Tiny surface mount components abound. You won't find these parts at Radio Shack, and you wouldn't want to solder them in anyway.

The 2 main circuit boards are surrounded by an internal metal frame, and the IF and 800 MHz front end circuits are on small circuit boards, mounted vertically on the main audio/RF board. The PLL is on another small board.

How Does It Work?

My first 200XLT had a problem. The squelch threshold was different for different bands, and had too much hysteresis, which caused it to skip over VHF signals and stop only on UHF signals. This is probably caused by misalignment, rather than a design flaw, as four friends with 200XLTs had no such problems. Grove Enterprises graciously swapped the defective radio for another brand new 200XLT, and the exchange took about a week using UPS shipping.

The squelch action on the new 200XLT is quite good, much better than on the 760XLT and PRO-2004, both of which have too much hysteresis. UHF sensitivity is excellent, and while I don't often listen to aircraft, the sensitivity in the AM aircraft band appears adequate.

Using an outside antenna, the 200XLT is sometimes bothered by the obnoxious 300 watt paging transmitter nearby, but so was my 800XLT on an indoor whip. Expecting a portable scanner to behave well on an outside antenna may be asking too much.

Most every superheterodyne receiver has birdies, those places on the dial where the receiver "hears itself." The 200XLT owner's guide does not list birdies, but they're there. Many of the birdies are weak, and disappear when the heliflex antenna is replaced with an outdoor antenna.

The first IF is 10.85 MHz, and the second IF is 450 KHz. Images of stations in the UHF range were noted 21.7 MHz higher than their assigned frequencies. The cellular telephone bands are disabled, but strong cellular phone signals are heard 21.7 MHz higher than their assigned frequencies anyway. Some people might consider this an advantage! Besides, there's not much activity above 892 MHz to listen to yet.

The 200XLT hears TV stations where they shouldn't be - in the 850 and 890 MHz bands - thanks to multiple injection into the mixer stage, no doubt.

Scanners sold by Grove Enterprises are supplied with instructions detailing how to restore cellular phone band coverage. The instructions for the 200XLT just involve crushing one resistor, but I haven't tried this.

Both my 200XLTs were a few kHz off frequency in the 800 MHz band. Weak signals were slightly distorted, and using the search feature revealed an asymmetry - I could hear the station +12.5 kHz stronger than -12.5 kHz away from what was supposed to be the center frequency.

Having no schematic, I deduced that the orange non-ceramic trimmer capacitor on the PLL board (the board with the horizontal crystal on top of the IC) determined the PLL reference frequency. I programmed a frequency near 850 MHz on the 200XLT, then adjusted the trimmer capacitor while listening to the local oscillator signal 10.85 MHz lower on my ICOM R-7000. The discriminator meter on the R-7000 makes that radio a great test instrument, but be sure your R-7000 is properly aligned before using it to align other radios!

What You Get

Like the 100XLT, the 200XLT comes with a leather-like case, but it's gray instead of black. The case has openings in all the right places, so one can charge the battery without removing the radio from the case. There is a belt loop sewn on the back, but a user must unfasten his/her belt to thread it through the loop, a big inconvenience. The scanner cannot be left standing up while in the case, because the case bottom is rounded.

There is no belt clip on the 200XLT. To carry the scanner on my belt, I use a yuppie-ish Bianchi, hand-tooled leather case, made for the old Kenwood TR2400. My wife bought the used case at a hamfest for $1.50.

The 200XLT also comes with an AC wall adapter, an earphone, and a helical antenna blessed with a BNC connector.

UNIDEN scanners no longer come with an owner's manual, but with a difficult to use fold out sheet instead. The instructions aren't great, but will tell you most of what you need to know. Of course, you don't get a schematic, but you can order it.2

Summing Up

The UNIDEN 200XLT works well. It scans fast, sounds good, and excels in the amount and organization of its memory channels. The 800 MHz coverage, multiple priority, frequency finding, and slide-on battery pack features make it the "Lincoln Town Car" of portable scanners.

So far, the 200XLT is the best handheld scanner I've ever used. Now I'm waiting for Radio Shack to shrink the

PRO-2004, so we can enjoy continuous frequency coverage
in a portable scanner!

The individual who recommended a cross band repeater for a 220/440
link had a good idea. I will try to arrange it with my friend (KA1OKQ)
to have his radio do the trick for us. The two frequencies nominated
are 223.60 (dir) and 446.6 (dir). This should take care of most interests.

BTW the person who mentioned that he had never seen a 220 radio outside
of a catalogue has just been on the wrong band all these years :-)

Also for those without radios I'll try to suggest a meeting spot and time.
Suggestions gladly accepted.

Source record: 14591

Some one, in reply to a request for comments on ham radio construction projects, discussed the difficulties in realizing crystal filters.

This brings up an important philosophical point: just how much of the equipment do you have to design and fabricate to qualify for "home made". I, for one, don't think that it makes much sense to build even major components which are common off-the-shelf items. These include:
transistors
integrated circuits
loudspeakers
IF crystal filters
frequency control crystals
"block" VHF power amplifiers (Motorola and Japanese)
microwave integrated circuits
in most cases, diode ring mixers (Minicircuits and others)
etc.
My goal would be to get a working rig with modest effort. In any case, building a "real" rig is a substantial undertaking. OK, go back and replace some of the off-the-shelf components with those of your own design at a later date - but stick as much as possible to system design, not component design, if you want a useable product in a finite time.

Hats off to those who can do ALL the detailed parts and finish in a reasonable time.

One person's opinion... 73, Bob, W3OTC

To: ALL@ALLBBS
Subject: QSLMGR Server @ W1NY

I have placed the QSLMGR server online at the W1NY BBS. This server will
keep a database of QSL managers, and requests from users for QSL managers.
You can submit a request to the server asking for a particular station's QSL
manager, and the server will return a message to you with the information. If
the server does not know the QSL manager for the station you request, it will
file your request and send you a message if it does find out.

To learn more about the server, you should submit a HELP request to it. Send

a message to QSLMGR @ W1NY. The subject of the message is ignored by the server

so you may put whatever you like. In the body of the message, simply put the
word help. If you'd like to see what a sample session of sending a message to
the server might look like, submit your message with the word sample rather
than help.

If you have any questions or comments about the server, I'd love to hear
them! Input is always welcome.

Subject: QSLMGR Response

QSLMGR (QSL Manager Server) version 1.3 is running on 12-Nov-89 at 19:40
(c) Copyright 1989 Bob Lafleur, NQ1C @ W1NY

*** Please send your requests to QSLMGR as Private messages, not Bulletins!

[sample]
A typical session for submitting a request might look like this:

```
k1mea bbs>
SP QSLMGR @ W1NY
subject:
QSL REQUEST
message:
V47RF
SM5BRW
<control-Z>
message 14000 stored.
```

In this example, a request for the QSL managers for the stations V47RF and SM5BRW has been submitted to the server. An update request might look like this:

```
k1mea bbs>
SP QSLMGR @ W1NY
subject:
QSL UPDATE
message:
UPDATE
A22WZ OE3NH
V47RF WA2SPL
W200NY KA1KPH BOX 17, Feeding Hills MA 01030

<control-Z>
message 14001 stored.
```

This request will add A22WZ to the database with the QSL manager of OE3NH, V47RF with WA2SPL, and W200NY with KA1KPH's address.

```
k1mea bbs>
SP QSLMGR @ W1NY
subject:
REQUEST
message:
DUMP
<control-Z>
message 14002 stored.
```

The above will cause the server to return a list of all the routes that you have requested which were not fulfilled by the server.

The following example shows how you can do multiple commands with one request. Any command that takes a list of callsigns will recognize a blank line to mean the end of the command. The following example illustrates removing calls from the database and adding new calls to the database all in one server request.

```
k1mea bbs>
SP QSLMGR @ W1NY
subject:
```

```
INFO UPDATE
message:
DELETE
A22WZ
A24EE
(blank line ends delete section)
UPDATE
V47RF WA2SPL
<control-Z>
message 14003 stored.

Any questions, comments, or problems about the QSL Manager Server
may be directed to NQ1C @ W1NY.

[ There are 391 pending requests. ]
[ There are 6290 entries in the database ]

4956. '727 and more

Newsgroup: rec.ham-radio
Date: 1989-12-20 20:30:00 UTC
From: 390624331@UWPLATT.EDU
Message-ID: <07397794BBDF4010D6@uwplatt.edu>
Source record: 14593

Hello net, this is my first posting so I hope that everyone gets it.

I have had the FT-727R for awhile, and it seems that every HT is 'born' with a different receive range (after the "extended coverage" type-in). Is there a way to slide or change this range without affecting the performance of the radio? My radio goes up high enough to RX pretty much, but not a lot of the "good stuff" like police. I saw a mod for a Kenwood awhile back (from a friend and it involved changing the PLL a little. Is there a way to do this for the '727? Someone else on here asked for the same thing, so maybe someone has a solution. Note that the 70cm seems to have great coverage, but the 2M is pretty thin...
Also on the subject of modifying radios and not using them out of their type accpeted range (besides into a dummy load), what about rigs that we build ourselves? I am aware of the limits of harmonics, etc. on any radio (built/bought) but the type-acceptance thing must apply only to commercially-built radios? I assume that that is the rule but some of these rules start to get confusing after awile!
Any help on the top paragraph appreciated, which I hope should not be that hard since the '727 is not exactly what you'd call new anymore!

Randy Kruszka, WK9M
Address: 390624331@UWPLATT.EDU

"Sure, my dual-band HT does not have as many functions as yours, but mine is heavier!"

P.S. I will not be able to reply (going home for break) after the 21st of Dec. but I will be back next month. I probably need more than a DVM to do the PLL mod anyway, so I'll have to do it here...

4957. alternative to FM tranceivers?

Newsgroup: rec.ham-radio
Date: 1989-12-20 20:31:19 UTC
From: langz@asylum.SF.CA.US
Message-ID: <9170@asylum.SF.CA.US>
Source record: 14725

First off, I am a radio novice with a good technical background in non-electronic areas. I understand logic and the basic principles of electronics, but I couldn't build something from a schematic. I do have friends who are electronics hackers and can read schematics, but none know radio. I have a radio problem which could be solved by hacking existing equipment or locating suitable alternates. Now...

I produce live roleplaying "living fiction" weekends at a wilderness site in northern California. At the moment we are using FM headset tranceivers for communication between staff. This workks for the most part, since staff aren't usually too far apart, the grounds are fairly flat, and the structures are mostly wooden without thick walls or wiring. Unfortunately, there is one part of the site (the "Indian Bowl") which is up a wooded hill. The tranceivers communicate (with difficulty) almost the complete distance between the Indian Bowl and the production control center, but not quite.

The tranceivers are small boxes which attach to staffers' belts, with attached headsets with boom mikes. Can anyone suggest an alternative with a better range. The system must be lightweight and portable, and an earphone for private listening is essential. We would like to keep costs down and avoid red tape, so equipment which requires courses and license exams is not exactly prefereable.

Alternately, I'd be interested in learning about any way to extend the range of our current equipment. The systems span a fairly wide frequency range, so increasing the FM deviation wouldn't necessarily cause a problem (we could just use the middle of the five frequencies), if that could help. If any such modifications would be in violation of FCC regulations, please let me know. Naturally, I am interested in learning about such modifications for educational purposes only.

In case they are helpful, I've attached the transceiver specs below. Thanks!

Maxon Model 49-H5 FM Tranceiver
Specifications

General:
Power source 4 x 6VDC "AA" size batteries

Frequency range A -- 49.830 B -- 49.845 C -- 49.860
(5 channels) D -- 49.875 E -- 49.890

Current Drain Stand-by: 20 mA
Receive: 60 mA
Transmit: 50 mA

Service range Avg.: 400 meters
Max.: 800 meters

Dimensions 160mm x 72mm x 24 mm

Receiver:
Receiving system FM dual conversion superheterodyne

Intermediate frequency First: 10.7 MHz
Second: 455 KHz

Sensitivity 1 uV (20dB quieting)
1 uV (squelch open)

Spurious/image reject 20 dB min.

Frequency stability +/- 2 KHz (0-40deg C)

Speaker impedance 32 ohm

Transmitter:
Transmitting system Voice-activated or manual switch to begin transmit

Power 10,000uV meter @ 3 meters (FCC Maximum)

Antenna 50 ohm flexible whip

Modulation FM

Max frequency deviation 4.5 KHz

Audio distortion 10% maximum

Frequency stability +/- 2 KHz (0-40deg C)

Microphone electret condenser

Message-ID: <1809@ultb.isc.rit.edu>
Source record: 14589

I have the following people on my list ... I don't think that I
really lost anybody - if you're missing, we'll fix it ASAP.
If you missed what's going on here, I'm compiling a list of
people involved with university amateur radio clubs, to exchange
ideas etc. with each other.

I'll ask Phil to post something to here about how to add yourself to
the list...I know how to do it from bitnet, but not from internet.

Write me email to cep4478@ultb.isc.rit.edu if you wrote me and I missed
you - I'll be writing personally to everyone probably right after the
new yar.

Henry,

I, for one, would like to encourage you to renew.

I can't claim to totally eschew the "appliance" concept, as I own a Drake 4 Line (older, but appliance nonetheless, not home-brew) and a couple of VHF/UHF riceboxes. I started out with kits and home-brew, but later I discovered there was more to Amateur Radio than solder and wire.

I see Amateur Radio as a multi-faceted entity. The true challenge today might be to get what you want out of it. Maybe it is to bring something new to it. Certainly a good thing is to spend some time helping someone else get started. (How much influence did the hams you met early on have on your perception of it, on your enthusiasm for it?)

You have had a very poignant view of Amateur Radio which, up until the last line, I think you expressed rather elegantly.

C'mon, renew! Even if you don't feel like it now, you'll still have it, still be "connected," and maybe one day soon you'll find that enthusiasm once again. Believe me, I know.

By the way, my most recent QSO was on CW in the 15-meter Novice band just prior to a code practice session/study group at the club station.

73,
Bob WA8YCD

4961. morse code practice program

Newsgroup: rec.ham-radio
Date: 1989-12-20 22:07:04 UTC
From: scotto@crash.cts.com
Message-ID: <948@crash.cts.com>
Source record: 14577
Cross-posted to: rec.ham-radio,rec.radio.shortwave,comp.unix.xenix,comp.sources.wanted

Does anyone have a morse code practice program for Xenix? I saw mention to one in comp.unix.xenix and replied to the author, but didn't hear anything back and lost his original post.

I bought two of "Gordon West's [call me Gordo]" books to help me learn the code and jump right to Tech, but am finding myself wanting some real "random", but meaningful practice. I was thinking of saving some usenet articles and running them through a morse code generator for practice. This saves me from having to buy a radio (course I can't buy one until I'm licensed, right? :-) and I can sneak in some practice while working.

So, any of you have a program like this? Do you have any other ideas, besides running MS-DOS?

Thanks in advance

From: henry@ginger.sri.com
Message-ID: <7114@unix.SRI.COM>
Source record: 14588

My apologies to those who might have been offended by some strong language I used at the end of a recent posting. I would like to point out that I was replying to the signature offered by Michael Batchelor in which he made an off-color comment about code, encrypted in dots and dashes. The final line to my posting quoted Mr. Batchelor, and so the comment was not entirely out of the blue.

A New Jersey ham politely but firmly asked me to watch my language because a group he is associated with retransmits this bulletin board via packet radio. In my reply to him, I expressed surprise that retransmissions occur automatically without the immediate supervision of a control operator. This strikes me as somewhat illegal, since there is no means of controlling the transmission content.

Comments?

In any event, I admit it is in bad taste to publically propagate obscenity. But the computer net is not amateur radio. I wonder if some people forget that fact when they feed USENET directly into their packet systems.

-Henry

> ........................... And, if I recall correctly,
> KA9Q has already been ported to it.
```

Yes, KA9Q has been ported. I just ordered the disk from some place I found in 73. (I was a bit concerned giving my VISA # to an answering machine but the disks came and I havn't been overcharged.) I haven't tried it out yet so I can't say if the port is any good.

```
>
> Does anyone make a UN*X for Amiga? That would complete the picture.
```

I just got e-mail from a guy at CBM several days ago. I had sent a request about AMIX on a 1000. The answer I got was that AMIX will require a 2500 when released. My guess is that it will be released with Kickstart 1.4 and require the CBM hard disk controller. (Be reasonable; how many hard disk drivers can you come out with when the package is brand new?)

In the meantime there are a lot of pieces of software which can make an Amiga look extremmely like a UN*X box. After taxes this year I plan to finally get a hard disk for my 1000 and start loading it to look like our favorite OS. If I can, I'll try to get news running (HA HA they all laughed.)

It's ALREADY illegal to send codes or ciphers on Amateur Radio, except for generally-recognized abbreviations or "signals". I think the idea is that the purpose of the encoding is to facilitate communications, not to obscure the meaning.

Seems to me this is the key -- If you are ARC'ing a file to save transmission bandwidth, than that conforms to the spirit of the FCC rules, if you are encoding the transmission in order to obscure the meaning, then you're out of line.

> Has anyone tried this with Marine radios or cellular telephones?

I used to work in a marine electronics shop, and had access to lots of
junked but fixable radios. Some notes on conversion to ham use:

1) The old crystalled radios are fairly easy to convert to the ham
bands by simply re-tuning the appropriate tuned circuits and
oscillators. The only drawback is...they're crystal controlled! (and
usually need separate T and R crystals)

2) Newer synthesized radios are pretty slick. However, they are MUCH
more difficult to make work in the ham bands since they are
synthesized, and the working frequencies are channelized. The marine
channels follow a nonintuitive pattern, so that these radios are
controlled through a diode matrix or a ROM lookup table which may be
difficult to decode (or, they are microprocessor controlled with
internal ROM, which is even more troublesome). Also, the duplex
splits on marine band are 4.6 MHz, often accomplished in a funny way
so as to make conversion to a more reasonable split difficult.

If you are willing to build a whole new PLL section/synthesizer, or to
add a simple crystal oscillator in the place of the PLL VCO, these
radios are not bad.

3) Marine radios are nice in that they are built like the proverbial
brick s***houses. They are FCC type-accepted, for all those wishing
to use their ham rigs on the commercial bands (with the appropriate
license and/or situation, mind you...). They are also weatherproof
(by necessity...) and well made. I particularly recommend those sold

by Raytheon (and made in Japan by...umm...aarrgh, I don't remember.
Anyway, their circuitry is clean, and the owner's manuals are VERY
good and include schematics, PCB layouts, and theory of operation.

4) A word of advice: know the status of any old radios that you pay
money for. The old ones are not well weather-sealed,and salt spray
does n-a-s-t-y things to PCB's. Even some well-sealed radios have
been completely submerged at one time or another, so at least give 'em
a visual check.

Good luck,
mike

Obviously that's a > matter of interpretation. One interpretation,
which is the one I would use, > is that anything that can be bought
for less than a thousand or two, or that > can be built in a
reasonably equipped hamshack, is "generally accessible". >

However reasonable your interpretation, it really doesn't matter. What
matters is how the case would be presented to a jury of "your peers*"
in a court of law where you would be prosecuted.

Think about it in that light and you may want to change your
interpretation.

Ron Miller
NW0U

* "your peers" generally winds up meaning citizens chosen for their
availability and specific lack of knowlege in any pertinent area
of your case. After having been disqualified from jury duty in
a case where a young man flew an airplane into power lines and was
suing the electric utility for damages, I saw that being a pilot,
an electrical engineer and a former Naval Officer (????) totally
disqualified me from being a juror. The little old lady who
doesn't know three-phase electricity from a solar eclipse was who
they kept.

I saw an article in one of the magazines (QST Hints & kinks??) about
a year ago that did just that. It seems that it only takes the
swapping of 2 wires inside to reverse the power and squelch controls.
If you look at the schematics, it should be easy to see. It seems
that nearly everyone who owns a '140 thinks about that within a week.
I am very nearly breaking down to the point of buying a TS-680S to
pick up on 6m. In 22 years of ham radio, I have never worked the
6m band.....with my luck I'll finally get the money for it at the
end of the sun-spot cycle......Murphy lives in my back pocket.

I have heard quite a few TS140 and TS-440 rigs on the air. They
sound great!! I never hear any complaints about them, just real
nice signals. Have fun, don't drown...

Orga: HP Networked Computer Mfg. Operation

I use my scanner in the kitchen to monitor the 2 meter repeaters.

When I hear a friend on, I turn on the rig and give 'em a call.

90% of the hours on my scanner are amateur radio-related. 73 Magazine
is going to have an article on scanners in a future issue, I hear,
that will feature two modifications: 1.) how to use the scanner to
measure FM deviation and 2.) how to use it to decode PL frequencies.

> however only the "three knob" ones seem to offer "inputs for random wire", > but then the "third knob" is nominally for tuning connection to the > "transmitter", which should be non-critical for recieve only operation.

The two knobber is probably an L network which can, in addition to resonating the antenna, transform a high-impedence to a low (or visa-versa if you reverse the connections). The three knobber is probably a pi which can resonate as well as perform impedence transformations in both directions without requiring re-cabling or internal switching.

A "true" long wire (>= 1 wavelength) will have an impedence > 50 ohms and as such an appropriately connected L will suffice. The three knobber you refer to probably has those extra "inputs" with connectors, switch positions, etc as part of function packing to raise the price point up a bit.

> Let's not impugn the FCC so unfairly! The problem both you guys are having
> is with your VEC, not the folks in Gettysburg. I'm a VE with the Sunnyvale,
> Ca. VEC, and I guarantee you that the FCC is utterly predictable.

On the contrary, I thought 45 days was GOOD. The other guy is flaming
(slightly) I guess, but I really don't mean to. Those folks have plenty
to keep 'em busy, and I was amazed at the consistency with which we got
licenses back in a *>reasonable<* amount of time!

> We give
> our exams on Sunday, and the successful candidates get their tickets EXACTLY
> 29 days later--in Monday's mail.

That's terriffic! I guess it takes about a week in the mail from Gettysburg to
the licensee? Any comment? I assume that'll be the same for everyone, since
the outbound license does not go through the VEC.

> Now it is true that we express mail all of
> our 610's immediately after the exams, but then we feel we're here to serve!

One might infer from this that in addition to processing time at the VEC,
there is also significant time in the US Mail.

(I have no information that suggests that Fred uses anything else.)

> Now it is known that the ARRL VEC has a nasty habit of sitting on the 610's
> before sending them in, and people here locally who took their exams with the
> ARRL end up waiting ABOUT six weeks. But it's not the FCC's fault.

I can't really comment on ARRL VEC, I've had very little dealings with them.
I am working with a group in the W5YI-VEC, and am commenting on the results
from that.

> Another thing I would mention in this regard is that the VEC cannot mail in
> a 610 if there is a license application pending with the FCC. We will hold

Are you serious? Have you been on the packet networks in the last, oh,
say, 4 years or so? Unattended operation is explicitly permitted.
I view network interconnecting as just another form of permitted
third party traffic on VHF nets. True, I'm responsible for the contents
but I am for ANYTHING that goes through my station. Apparently BBS
sysop'ing is not for the weak of heart or the Grubs of the world.

Since I'm in the final stages of putting such a gateway on here in
Atlanta, I've given this a bit of thought. I am of the "the glass is
half full" mentality. In other words, if it is not CLEARLY prohibited
and is not in poor taste, then I'll do it and NEVER be so stupid as to
ask the FCC for permission. I'll probably filter the feed through
a "7 dirty words" filter ONLY for the consideration of others on
the ham net and NOT out of fear of the FCC. I'll bet a pink slip
that the FCC would not touch the 7-dirty-words issue for fear of a 1st
amendment challenge to the arbitrary rule against "profanity". (I echew
profanity on ham radio AND this network for the same reason I dislike
discussions about hemorhoid surgery or "Too many SWRs" or the weather -
it makes the speaker sound really stupid and uneducated.)

> In any event, I admit it is in bad taste to publically propagate
>obscenity. But the computer net is not amateur radio. I wonder if
>some people forget that fact when they feed USENET directly into their

Not really. Perhaps we have an idealistic hope that hams are above
the norms of today and will observe proper decorum in this group.
By and large, that hope proves to be true. As in any endeavor, there
is a give-and-take. I have to weigh the benefits I provide to hams
who read this group on the packet nets against the very remote
possibility of getting my wrist slapped for transmitting a selection
from the SDW list. Framed in that light, the choice is obvious.

Oh, before I forget. Regarding CW, and in full regard for those who
repost, "Fornicate the Code!".

It also matters how creative the legal arguments get. Unfortunately, you
often have to be VERY creative, costing lots of $$$$'s, to protect your
rights. The same system also lets criminals off.

I suppose there are times when trial by judge might be better. Obviously
lawyers don't want experts on the jury because they can't sway them :-)

4980. Profanity on rec.ham-radio

Newsgroup: rec.ham-radio
Date: 1989-12-21 14:09:08 UTC
From: 702WFG@SCRVMSYS.BITNET
Message-ID: <8912220803.AA29003@ucbvax.Berkeley.EDU>
Source record: 14602

I agree that passing this traffic thru to Packet Radio without screening
is not wise (and probably illegal) but I can also think of at least one
other good reason to keep the level of profanity down to a minimum.
Not all hams are OFs. My daughter (10 years old) is getting interested
in ham radio and I have access to INFO-HAMS (which forwards rec.ham-radio)
available at home. Maybe you should think before you type if what you
are going to say is proper in mixed company. I would hate to think that
I have to tell my daughter "You can't read that cause HAM RADIO is X-rated."
:-(
I can think of no time when profanity has added any value to a conversation
here or anywhere else.

From article <1260014@hpmwtlb.HP.COM>, by timb@hpmwtd.HP.COM (Tim Bagwell):
> The problem with this approach is that the radiation pattern varies all over
> the place. For a full wavelength dipole or shorter, the pattern is the
> usual toroidal shape. As the wavelength gets shorter, sidelobes develop that
> rob power from the main lobe. Maybe this is desirable, maybe not.

This is true.

> Since at HF most of the noise is atmospheric, it seems to me that you want to
> have a low angle of radiation. A dipole is lowsy in this regard since you pick
> up noise from the sky directly above you, but you dont find many useful signals
> there. Either a vertical or yagi improve this problem.

This isn't. You are ignoring the effect of the ground on the antenna's
elevation pattern. At frequencies where the antenna is an integral number
of half-wavelengths above the ground, you actually have a null pointing
straight up. So the situation with regard to the radiation pattern as a
function of frequency is even more complex than you describe. Even if it
is an efficient radiator (i.e., not broadbanded by resistive loading, etc.),
the broadband antenna is a compromise, since its pattern is bound to be
undesirable on the some of the bands of interest. On the other hand, it
would have useful coverage to _somewhere_ on any band - so it would frustrate
a dedicated DXer, but would suit a casual ragchewer just fine.

4982. QST misinformation...

Newsgroup: rec.ham-radio
Date: 1989-12-21 14:43:44 UTC
From: Luck.Hurder@f670.n142.z1.fidonet.org
Message-ID: <9961.2590EF50@stjhmc.fidonet.org>
Source record: 14617

All de KY1T:

There's a bit of misinformation going around that I'd
like to set straight, folks. A USENET user (?), perhaps
N8DGN, I can't be sure, has been saying the following here
on the echo:

> They (the ARRL) are now changing their tune where microwave
> coverage in QST is concerned. It is not acceptable to
> ENTIRELY DROP microwave coverage from QST as they have
> done.

QST has done no such thing. They have merely dropped one column.
They fully intend to continue publishing any and all acceptable
articles regarding microwave that come their way.

> I wasn't asking for the ARRL to increase their microwave
> coverage, just to include some in QST

Which is precisely what they are doing...
> Paul Rinaldo, who is the editor of QST, made the decision
> to CUT ALL microwave coverage

False. Wrong. Uh-uh, no way. This guy isn't reading the letter
that Paul wrote very well...

> I cannot accept his decision to TOTALLY CUT
> ALL microwave coverage.

Hey, I wouldn't accept that either, if I were an ARRL member,
which I am. Fact is, no such decision was made.

Once again - QST will publish articles that relate to microwave
activity as they always have done, provided that the articles
make it through the article-review process that all authors
must endure, and provided that the articles meet the normal
standards. Those standards, by the way, appear
in the January issue of QST for all to see. No secrets here,
simply normal, every-day public knowledge..
To put things in a different light for a second, I could squack
up a storm too, if I so chose. The same financial dilemma that
forced the microwave column to go that-a-way was also responsible
for my Public Service column to be cut by a whole page every
month. Public Service, traffic handling, and such were -- by
the way -- the things that the ARRL were FOUNDED on. If I
were to run around screaming that QST had dropped coverage
of public service activities, I'd be laughted out of the office!

Particularly with a FIVE pager coming up in the February issue
relating to the public service efforts of the many hundreds
of amateurs during the aftermath of Hurricane Hugo.

Enough soapbox. 73 de KY1T

QSL means "Acknowledge receipt of message" and used to be used solely with CW. Now, it has been bent, usually over "repeater lingo" to mean "I agree" sometimes.

I prefer saying "I agree".

TWAS THE NIGHT BEFORE CHRISTMAS, WHEN ALL THROUGH THE SHACK,
NOT A METER WAS STIRRING, NOT EVEN ON THE RACK,
THE FINALS WERE HUNG BY THE CHIMMNEY WITH CARE,
IN HOPES THAT ST. NICK WOULD TUNE THEM RIGHT THERE.

THE CHILDREN WERE NESTLED ALL SNUG IN THEIR BEDS,
WHILE VISIONS OF MOONBOUNCE DANCED IN THEIR HEADS;
AND MAMA WITH HER HANDHELD, AND I WITH A TRAP,
HAD JUST SETTLED OUR BRAINS WITH A HIGH VOLTAGE ZAP.

WHEN OUT ON THE TOWER, THERE ROSE SUCH A CLATTER,
I SPRANG FROM THE BENCH TO SEE WHAT WAS THE MATTER.
AWAY TO THE WINDOW I FLEW LIKE A HIGH TENSION FLASH,
TORE OPEN THE SHUTTERS AND THREW UP THE SASH.

THE MOON ON THE BREAST OF THE NEW FALLEN SNOW,
GAVE THE GLOW OF TUBES OF DAYS LONG AGO.
WHEN WHAT TO MY WONDERING EYES SHOULD APPEAR,
BUT A MINIATURE SLEIGH, WITH MOBILE AMATEUR GEAR;

WITH A LITTLE OLD HAM, SO LIVELY AND QUICK,
I KNEW IN A MOMENT, IT MUST BE ST. NICK.
MORE RAPID THAN McELROY, HIS KEYING IT CAME
AND HE LISTENED AND HE TUNED AND CALLED THEM BY NAME;

"NOW DASHER! NOW DAMPER! NOW PHASOR AND DX'EN,
ON COMMON! ON COUPLED! ON DONOR AND BLITZEN!
TO THE TOP OF THE SHACK, TO THE TOP OF THE WALL!
NOW DASH AWAY! DASH AWAY! DASH AWAY ALL!"

AS DRY DAYS BEFORE THE FIELD DAY DO FLY,
WHEN THEY MEET WITH THE FORECAST AND NEVER COMPLY,
SO UP ON THE SHACK TOP THE SIGNALS THEY FLEW,
WITH THE SLEIGH FULL OF GEAR, AND ST. NICHOLAS TOO.

AND THEN IN A BAND OPENING I HEARD ON THE ROOF,
ANTENNA WORK BY A HAM ON THE HOOF,
AS I DREW IN MY HEAD AND WAS TUNING AROUND,
DOWN THE FEEDLINE CAME ST. NICHOLAS WITH A BOUND.

HE WAS ALL TANGLED IN COAX, FROM HIS HEAD TO HIS FOOT
AND HIS CHECKSHEETS WERE ALL TARNISHED WITH ASHES AND SOOT.
A BUNDLE OF GEAR HE HAD FLUNG ON HIS BACK,
AND HE LOOKED LIKE A CONTESTER OPENING A SIX PACK.

HIS HANDHELD-HOW IT CRACKLED! THE SIGNALS WOULD VARY!
HIS EQUIPMENT MADE NOISES, HIS QSO WAS QUITE MERRY!

HIS DROLL LITTLE MOUTH WAS DRAWN UP LIKE A MHO
AND THE BEARD OF HIS CHIN WAS WHITE AS SLOW SCAN SNOW.

THE STUMP OF A PIPE HE HELD TIGHT IN HIS TEETH,
AND THE SMOKE IT ENCIRCLED HIS HEAD LIKE A WREATH.
HE HAD A BROAD FACE AND A ROUND LITTLE BELLY,
THAT SHOOK WHEN HE LAUGHED, LIKE THE ROLL OF A TELE.

HE WAS CHUBBY AND PLUMP, A RIGHT OLD ELF,
AND I LAUGHED WHEN I SAW HIM, IN SPITE OF MYSELF;
A WINK OF HIS EYE AND A TWIST OF HIS HEAD
SOON GAVE ME TO KNOW I HAD NOT TO QR-ZED.

HE SPOKE NOT A WORD, BUT WENT STRAIGHT TO HIS WORK,
AND TUNED ALL THE FINALS, THEN TURNED WITH A JERK,
AND KEYING HIS FINGER ASIDE OF HIS NOSE
AND GIVING A NOD, UP THE FEEDLINE HE ROSE.

HE SPRANG TO HIS SLEIGH, HIS HANDHELD GAVE A WHISTLE,
AND AWAY THEY ALL FLEW, LIKE THE DOWN OF A THISTLE.
BUT I HEARD HIM EXCLAIM ERE HE FADED OUT OF SIGHT;

"HAPPY CHRISTMAS TO ALL

AND TO ALL

A GOOD NIGHT"

John G. De Armond writes:

>Are you serious? Have you been on the packet networks in the last, oh,
>say, 4 years or so? Unattended operation is explicitly permitted.

I was a serious ham about a decade ago. At that time, interest in
packet radio was somewhat lower than it is now. I am ashamed of my
ignorance, but I will strive to overcome it.

I don't have the FCC rules on retransmission in front of me. Allowing
automatic retransmission of packet files is not the same as a carte-blanche
authorization to broadcast the contents of any digital message source.
I respect the need to maintain decorum in all public forums. Evidently,
decorum is particularly important on this one. I suggest that this
newsgroup would benefit from periodic posting of its charter and guidelines
for message language and content.

I have just read the contents of "news.announce.newusers", and it appears
to me that the rules for message content on the news service are considerably
less strict than those for amateur radio transmissions. I suppose the charter
of this newsgroup can legitimately demand that participants "behave as though
they are making amateur packet transmissions" -- because that is indeed
precisely what they are doing. In that case, let's see the charter posted
frequently and conspicuously.

-Henry

I'm building a repeater controller with an Intel 8751 (actually it's an 8744, but I don't use the HDLC controller).
This is my first attempt with the 8744 and it's not working the first time.
I use all the I/O pins, so I have no way to look at what's going on inside. It is very difficult to debug. Yes, I'm adding the equivalent of print statements in the code and toggling them out a borrowed i/o pin, but it's less than satisfactory. Turnaround time for changes is awful. I've pulled out all my remaining hair.

Is there any simulation/emulation software that will execute my code and provide debugging support? Something that runs on a unix machine ansi BASIC, C, Fortran, Pascal would be best. I could probably borrow a PC if I had to.

Thanks miker

I was thinking the same thing, Henry. At one time, I had dreams
about setting up a packet <-> internet gateway, forwarding email
for AX.25 and supporting ftp for those lucky enough to have TCP/IP.
FTP and TCP/IP is no problem, since I would only let it be accessible
from the packet side, but I'd have to look at every single piece of
EMAIL and put my callsign on it, and handle it (basically) third
party. The other alternative would be to let email originating from
someone I know is a licensed amateur through, in which case they
would be in "remote control" of my station (perfectly legal) - problem
there is that then the guy who is this remote control operator
then has to follow the part 97 rules about providing reasonable
security about non-licensed people activating the system. (i.e.
can't walk away from your terminal, etc.)

Interesting issue.

Perry Scott asked why W1W doesn't listen before they transmit bulletins and code practice. I was a W1AW operator many years ago, so perhaps I can reply.

The problem is that they transmit on all ham bands 160 thru 2 meters simultaneously. It would take an army of operators to listen to each frequency before each transmission. They switch between CW RTTY and phone frequencies dozens of times each day to maintain the published schedule, so you can see the impracticality of listening on each freq.

The other problem is what to do if the frequency is in use. If the users refuse to move, you either have to transmit on top of them (which could be construed as intentional interference, a violation of the rules) or try to change frequency. The latter option would make it difficult for W1AW's listeners to find the station when needed.

The times and frequencies are published in advance. I realize not too many of us have the W1AW schedule memorized, but many/most CW operators are aware of the W1AW frequencies and try to avoid them. On phone, the bulletins only take a few minutes to send, so the interference is minimized. I am of the opinion that not too many people listen to W1AW bulletins on phone anyway, so ARRL should just eliminate them.

We, a small group of computer enthusiastics are providing (besides our normal work) an electronic news and information system in Switzerland (Basel). It is necessary for us to get information. Although we already are supported by more than 200 companies in Switzerland, we would also like to get information from all over the world.

Because we haven't got the financial possiblities of a big computer-magazine or newspaper, we try to establish connections through this network.

We are looking out for: - press-releases and brochures from computer companies, concerning new products,
statements, ideas, company-internals and
-profiles
- things about computer going on in other
countries
- people, who would like to write articles
for us from time to time
- people we could or should contact for
news on MS-Dos, Unix, Apple or whatever
- people, who want to have something pub-
lished in the swiss press
- ...

All information and requests may be sent to us in various ways:

>> ohm! (Moral of the story: Use thick wire or tube for short antennas!)
>
>True and another reason why a small diameter helical antenna is worse than
>a simple vertical of comparable height and wire size.

Ah, but by how much is it worse?

Ummm, but I'm not transmitting. Im, well, umm, one of those SWL folks
who like to listen .... Since efficiency isn't as important as SN ratio
for a reciever why do I care? Yeah, I will have a little less signal,
but that isn't nearly as much of a problem as finding a place to put
up a 31 meter (or 60 meter!) vertical ...

Per _The ARRL Antenna Book_ page 6-18 heading 'Short Helically Wound
Vertical Antennas'

Shortened quarter-wavelength vertical antennas can be made by
forming a helix on a long cylindrical insulator. The diameter
of the helix must be very small in terms of wavelength in order
to prevent the antenna from radiating in the the axial mode.
Acceptable form diameters for HF-band operations are from 1 inch
to 10 inches when the practical aspects of antenna construction
are considered.

Looks to me like 4" diameter is in the reasonable range. The diameter
should be small in terms of wavelength, so I would expect that for
a 31 meter band antenna even using a 1 meter diameter would be OK;
though with some increased tendency for 'high angle radiation' as
the mode of radiation starts to shift from broadside to axial.
Though it does say 'very small' so maybe 1/30th isn't very small...

And further on:

No strict rule has been established concerning how short a
helically wound vertical can be before a significant drop in
performance is experienced. As a general recommendation, one
should use the greatest amount of length consistent with
available space. A guideline might be to maintain an element
length of 0.05 wavelength or more for antennas which are
electrically a quarter wavelength long. Thus, use 13 feet or

more of stock for an 80-meter antenna, 7 feet for 40 meters,
and so on.

This works out to 5 feet for a 31 meter antenna, so a 4 foot length
should still be OK unless there is some profound non-linearity that
isn't mentioned... Though I must admit that adding a loading coil to
it for use on 60 meters was clearly a bit of whimsey and would be
subject to loading coil losses. (But it was fun, though!)

and:

No specific rule exists concerning the size or type of wire one
should use in making a helix. Larger wire sizes are, or course,
preferable in the interest of minimizing I**2R losses in the
system. For power levels up to 1000 watts it is wise to use
a wire size of of no. 16 or larger.

Since I'm using it as a recieving antenna I don't have much 'I' to
square and I would expect that no. 16 wire would be serious overkill.
It doesn't look like copper tubing is needed.

They then go on to discuss the use of an L network to match the low
impedance (which they say is on the order of 5 ohms - I still need to
figure out how to properly measure mine with the antenna bridge...) and
show a practical antenna design for 7 MHz with 2:1 SWR over 50 kHz.
(NOT pudgy wound though...).

(There is also the mention of using helically wound ground plane
elements for the counterpoise, but that is another discussion)

In summary, I don't contest your observations; they are quite true.
The numbers need to be looked at to see if they are important.

I think that the above quotes are evidence that, with a matching
network, the effects you describe are not significant for an antenna
used for recieving the 31 meter band that is 4 feet long and 4" in
diameter; and are probably not important for transmitting if no. 16
or larger wire were used.

What do you think? Have I missed something in my interpretation of
what they have presented as fact? Are their rules of thumb off base?

5000. Meteor Showers

Newsgroup: rec.ham-radio
Date: 1989-12-22 12:45:39 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <8912230803.AA15064@ucbvax.Berkeley.EDU>
Source record: 14622

Jim (AD1C) posted a listing of predicted peak times for major
and minor meteor showers for 1990. This listing is very useful,
but users should be cautious about some of its data. Joe Reisert
made a great contribution to VHF meteor scatter when he described
a means of predicting shower peaks by use of Ecliptic Longitude (EL).
However, the values of EL used in Jim & Joe's tabulations are out of
date and so several predicted peak times do not agree with those
of modern radar-based meteor astronomers. Below are peak date/time
data based on recent scientific literature:

Quadrantids 03 Jan 1806 UTC Slow
Lyrids 22 Apr 0900 minor
Eta Aquarids 05 May 0900 Very good
Arietids 07 Jun 1400 daytime, slow
Perseids 12 Aug 1800 very good
Orionids 22 Oct 0600 very good
Taurids 05 Nov 0600 minor
Leonids 17 Nov 1547 minor
Geminids 14 Dec 0000 Good but slow
Ursids 22 Dec 1700 minor

Note that most times are rounded to the nearest hour. This is because
it is impossible for anyone to accurately predict peak times more
precisely than that. Only for the Quadrantids and the Leonids are
peak EL values sufficiently well known for to-the-minute predictions
(and even these are actually good to only about +/- 30 minutes, I'll bet).

All peak predictions are inherently "iffy" because of uncertainty in EL,
perturbations by major planets to the meteor stream, uneven distribution
of material within the stream, and the basically broad nature of meteor
showers in the first place. How can anyone confidently predict the peak of,
say, the Delta Aquarids whose meteors fall to Earth during a period of over
2 months?

Lastly, predicted shower peaks are mostly useless anyway. This is
because the probability of making meteor-burst QSOs is MUCH more controlled
by the position of the shower radiant in the sky, which is continuously
changing (although highly predictable). For example, the predicted peak
may occur when the shower radiant is below your horizon and so it'll do
you no good. This is called "diurnal variation" and it's much more
important than "peak time."

Several computer programs are available to predict diurnal variation. They
are a good investment if you're serious about meteor scatter (woops - meteor
burst). Thanks again to Joe and Jim for stimulating VHF meteor work.

Happy trails -

> Perry Scott
> KF0CA

Absolutely true. As a an Air Force MARS operator (AFB1WA) I can tell you
that the FCC has no authority over Federal Government Radio Stations.
Federal Government operations are coordinated by something called
the Interdepartmental Radio Coordinating Committee (or something like
that.. I sure someone will post the correct title). This is the
organization that coordinates frequency usage and tolerance for
US Government operations.

Incidently, when I operate my station as WB2BOO I come under FCC authority;
when I operate on USAF frequencies as AFB1WA I come under the control of USAF
Communications Command, the USAF Frequency Coordinating Office and the
above mentioned committee. No type acceptance is required; I am responsible for frequency
tolerance. On HF, we generally have assigned frequency monitoring stations (FYMON's) to
check our tolerance.

By the way, I'm retired from CAP. CAP as a federal non-profit corporation is under FCC
juristiction in the Aviation Service. The FCC waived type acceptance for them due to the
volunteer nature of their operation. They do have frequency tolerances that have to be met
and an FCC commercial license is required to adjust the frequency on their sets. There was
a plan to move them as the USAF Auxiliary to USAF control, but it didn't go through due to
USAF budgetary restraints.
Type acceptance is basicly designed to ensure that the real appliance operator in other
services (the fireman, the EMT, etc) will not interfere with other services. Perhaps there
should be exceptions for such a person who also holds a commercial or an amateur license.

I for one appreciate modifications for out of Amateur band operations; one of
the major stumbling blocks for many Hams to get involved in MARS is finding
such modificaction information for their rigs. This forum provides a good channel for
desseminating such information.

I've worked with the 8051 for a couple of years. What would probably be the best is an incircuit emulator. There are several that can plug into an expansion slot of a pc. they can run your code stand-alone or replace the micro-p in your hardware circuit and then drive your hardware. The software on the pc that controls the emulator gives you a very good window into the micro-p itself. The prices range from $495 upwards. This is probably not what you were asking for, but they sure make micro-p development a snap. I would be interested in anything you come up with on the simulator.

Perhaps. As a child though, I was taught by my father that profanity
is the mark of an uneducated man. An educated man has a vocabulary that
is sufficiently large enough to make his feelings known without resorting
to vulgarity.

I would hope that the amateur community considers itself educated.

>ing number of QST articles that I end up just putting on the stack because
>there isn't a single article that I find interesting.

I disagree. _73_ has always seemed to me like watered-down electronics. I stopped reading it years ago. _QST_ is so much more than _73_ ever was or will be. Read "Technical Correspondence" sometime and you'll see what I mean. _Ham Radio_ used to be great technically, but it never recovered completely after the passing of Jim Fisk, W1HR. I still enjoy it, though (not as much since W1JR stopped writing last year ;-).

Rather than quitting the League (which does a lot more than just publish a magazine every month), have you considered sitting down to write an article yourself? If you don't like the content, try to do something about it! If you don't like contesting, just don't read the announcements/results - it's not like they take more than a few pages at most. Quit the League if you don't believe in the cause (support and representation for Amateur Radio), not just 'cause you don't find anything interesting in their 'report'.

Perhaps we can conform to the spirit of the law by adopting public conventions for compressed files. The "Z" convention for Lempil-Ziv UNIX(tm) files makes the "cipher" readable by anyone.

I recall passages in the FCC regs about having the key available at your station for decrypting, and making it available upon request from the FCC. Maybe that was back in 1975 and the rules have changed.

I think one of the contributions of Amatuer Radio in this area is to squeeze more out of RF data networks. So, it is within our charter to request the FCC to relax the cipher rule so it doesn't apply to simple compression for transmission purposes.

After many requests for access to DOSGATE via ftp, etc... I have uploaded
it to the SIMTEL20 server. Keith was gracious enough to make it available
to all who want it.

You want the following file:

pd1:<msdos.packet>dosgt114.zip

This is the latest DOSGATE (version 1.14), it fixes problems with the previous
release and allows it to be used with many more TNC's.

This release also fixes a problem that kept DOSGATE from working without a TNC
(ie, when trying to user a remote ASCII terminal).

What does DOSGATE do? It allows remote use of your PC via packet radio or
a remote terminal via modem or RS-232. This means you can run *almost* any
MS-DOS software that you could conceive... "*almost*", because, DOSGATE
is designed so that the remote user is NOT required to have any special
software of ANY kind... therefore, any programs that use graphics, color,
or don't interface with MS-DOS via INT 21H for console I/O should not
be considered DOSGATE compatible.

I won't bore the net (again) with the list of applications that I have
running on my DOSGATE system in Derry, NH (NM1D-2, nearest node SNH).

DOSGATE is also available via telephone modem on the following BBS's:

K4NGC (703) 680-5970
KA1MGO (508) 688-1348

In the interested of saving bandwidth for more useful discussion, this will be my last post on the subject...

In article <8912221605.AA11364@decwrl.dec.com>, reisert@victim.dec.com writes:
> I disagree. _73_ has always seemed to me like watered-down electronics. I
> stopped reading it years ago. _QST_ is so much more than _73_ ever was or
> will be. Read "Technical Correspondence" sometime and you'll see what I
> mean.

The last 3 months or so, I've seens letter after letter on the e-mailing lists I'm on and in rec.ham-radio that say, "well, you could always use _____, see the review of it in 73", or "there was a whole article on just what you're looking for in 73 last month!" I feel like I'm really getting lost in my own area of interest and that's because my only contact with ham radio has been through QST.

> Rather than quitting the League (which does a lot more than just publish a
> magazine every month), have you considered sitting down to write an article
> yourself?

No. While I feel I'm up to writing articles of the caliber that are currently published, I don't think I can write at the level I feel should be published. That wouldn't help the situation much.

> If you don't like the content, try to do something about it! If
> you don't like contesting, just don't read the announcements/results - it's
> not like they take more than a few pages at most.

I don't read them. That's the problem. I also don't read the League meeting minutes or any articles about what-I-did-on-my-vacation-relating-to-ham-radio. And that eliminates a good 70% of the magazine!! The only thing I really look forward to are the ads!

> Quit the League if you
> don't believe in the cause (support and representation for Amateur Radio),
> not just 'cause you don't find anything interesting in their 'report'.

If I don't find anything interesting in their report then I don't believe in the cause because they are not supporting Amateur Radio the way I think it should be supported.

I'm not interested in the politics and I'm not interested in "the good 'ol days" (especially since I wasn't even born in the good 'ol days). There's too much to be done; too much to learn, too much to design, too much to experiment with. I firmly believe that if we take care of this business, which *is* our business, the politics will take care of themselves.

My goal is to make the politicians stand back and say "What?!? You want to cut ham spectrum? Are you nuts? This country would go down the tubes without those guys!" And I want them to say it because they *know* it's true, not because we told them it's true. They have to be TERRIFIED to take it away. Not because of any legal action we take but because we're a service they can't live without. If the credentials of ham radio don't speak for themselves, we don't deserve to exist. I don't feel the ARRL supports this position.

In closing... my all-time favorite quote...

A hundred times every day I remind myself that my inner and outer
lives are based on the labors of other men, living and dead, and
that I must exert myself in order to give in the same measure as
I have received and am still receiving.
- Albert Einstein

I wish the whole world felt the same way.

Devon

The military/government agencies have special calibration and repair facilities where civilians usually use a radio until it dies. By ensuring that all radios go through a cal check on a periodic schedule, the type acceptance is a taxpayer waste.

>
> Al N1AL
By ARC'ing a text file you have generated code that uses the eighth-bit.
Any code using the eighth-bit is unspecified. Unspecified codes are
restricted to 6m and up. The restriction was probably meant to keep the
ARC file transmissions out of the HF bands, but I'm only guessing. That's
the spirit of the FCC rules. The cypher restriction does not apply to
compression algorithms, but may apply to encrypted ARC files. I for one
don't intend to ask for a clarification. In the military the first lesson
you learn is: "never ask permission". If it requires you to go up the chain
of command it must be a difficult decision, therefore act first, get permission
later (ie, decisions not already made in regulations/directives).

Las Cumbres ARC on 145.45 runs Westnet.
I think it is on Monday nights after the
7.30 P.M. net.

It also runs on WB6ADZ 146.115 but I forget
the time.

Icom and Yaesu, and most dealers, will give out the mods info upon proof of a MARS license. Apparently they will do so even if the mods do not actually increase MARS capability (such as on UHF radios). I cannot reach the Kenwood service department to find out their policy. I guess it does not matter since if I cannot reach them, I could never get the mods info, and I would not be buying a Kenwood radio anyway due to that mess.

So if you have a MARS license, it should be a lot easier to get the mods info. I also know of 2 dealers that have said they would do the mods for you, in case you don't feel comfortable about performing surgery on micro miniature surface mount circuit boards. Also Trionyx in Indiana does this business.

Gee, I use amateur equipment on military bands all the time, and no one
has ever come by to cal check it! The Civil Air Patrol uses military
frequencies. Also, in Arizona, the national guard operates on
2 meter FM just outside the ham bands. Standard equipment consists
of Kenwood ham radios. The national guard communications auxilliary,
called Broadway Consumer, is composed of all hams and uses their own
equipment on the same frequencies.

In fact, I am one of those with a legitimate reason to use ham equipment
out of band - for CAP and Broadway Consumer.

I was taught just the opposite, course my father cussed alot. He was college educated, even taught school for awhile until he got a real job. An educated man can use vulgarity to replace a whole paragraph. Never trust a man that doesn't swear, he said. What are you protecting the children from when you censor the mail? Those children that can read already know how to swear. You can't read a good novel without being confronted with a swear word. In short, this conversation sounds like two old Baptist ladies talking about the Catholics. Censorship is vulgar, only Communists and Nazi's approve of it.

**** UoSAT-OSCAR-11 BULLETIN - 207 22nd December 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT-D & E LAUNCH CAMPAIGN **

The UoSAT-D and UoSAT-E spacecraft have been successfully integrated with the Ariane Structure for Auxiliary Payloads (ASAP) and are now waiting for launch on 11 January at 01:34 GMT - alongside SPOT-2 and the four AMSAT Microsats.

The ASAP, UO-D & E and the four AMSAT Microsats shared a large clean room at the Ariane launch complex. With six spacecraft being worked on simultaneously, the scene was one of considerable activity!

Most of the UoSAT launch team has now returned from French Guiana after preparing the satellite for integration and carrying out detailed funstional check-out procedures. Martin Sweeting G3YJO and Neville Bean G8NOB have returned to UoS, whilst Jeff Ward K8KA has travelled to the USA. Maarten "Max" Meerman, G7DQE from UOSAT and Dave Cowdin, WD0HHU from AMSAT-NA remain in Kourou to 'baby-sit' the UoSATs/Microsats and trickle charge their batteries during their wait for launch in January.

The completed composite (SPOT + UoSATs/Microsats + fairing) will remain in the Assembly Hall over the Christmas period. On January 3rd, the composite will be moved to the launch pad and integrated onto the launcher.

The UoSAT launch campaign went very smoothly - which was as well since the satellites and ground support equipment were delayed for 5 of the 10 days of

the campaign! Systems and payloads on both spacecraft are performing nominally. Arianespace provided a very professional yet friendly service.

Details of initial operations, telemetry formats and equations will be published early in the new year as soon as they are finalised. However, it is most likely that initial operations on both spacecraft will utilise an enhanced version of the FORTH software used on UoSAT-2. This software provides the necessary facilities to perform initial check-out and attitude control prior to deployment of the gravity gradient boom used to stabilise the spacecraft in its final earth pointing configuration.

** AO-13 OPERATING SCHEDULE **

The following information is provided by AMSAT-DL.

AO-13 TRANSPONDER SCHEDULE

MODE B MA 000 TO MA 110
MODE JL MA 110 TO MA 145
OFF MA 145 TO MA 150 BAHN LAT +3.6 deg
S BEACON MA 146 TO MA 147 BAHN LON 179.4 deg
MODE S MA 147 TO MA 160
MODE B MA 150 TO MA 255
OMNI ANT MA 225 TO MA 035

AMSAT OSCAR-10 is currently available for whole orbit operation via the mode B transponder.

** Reports received from:-

Angus Newman, Birger Lindholm, K9CIS

Thanks for all of the reports received this year, Merry Christmas and a Happy New Year from "The UoSAT Team".

** $BID **

Please use BID $UOSAT.207 for PR BBS use.

(This posting contains long FCC rule quotes and analysis)

>From: Perry Scott KF0CA
> Perhaps we can conform to the spirit of the law by adopting public conventions
> for compressed files. The "Z" convention for Lempil-Ziv UNIX(tm) files makes
> the "cipher" readable by anyone.

Yes, I am sure we can. Read on.

>From: Perry Scott KF0CA
> I recall passages in the FCC regs about having the key available at your
> station for decrypting, and making it available upon request from the FCC.
> Maybe that was back in 1975 and the rules have changed.

You should have a copy of the new rules. I'll supply a copy of the sections
that affects this discussion:

[bracketed sections by ka9wgn, skipped section for brevity, read your copy]
begin FCC rule quote {
97.307 Emission standards.
(a)-(e) ...[various emission standards rules skipped]
(f) The following standards and limitations apply to transmission on the
frequencies specified in 97.305(c) of this Part.
[see 97.305(c) for which paragraphs apply to which subbands]
[be sure to see Sept 27 corrections as June 20 version had many errors]
(1) ...[section on angle modulation skipped]
(2) [note this paragraph does not apply (due to 97.305(c)) to RTTY and
data emissions, except on 160m] No non-phone emission shall exceed the
bandwidth of a communications quality phone emission of the same modulation
type. The total bandwidth of an independent sideband emission (having B as
the first symbol), or a multiplexed image and phone emission, shall not
exceed that of a communications quality A3E emission.
(3) [160-12m] Only a RTTY or date [note, "date" spelling error has NOT been
corrected by FCC] emission using a specified digital code listed in 97.309(a)
of this Part may be transmitted. The symbol rate must not exceed 300 bauds,
or for frequency-shift keying, the frequency shift between mark and space
must not exceed 1 kHz.
(4) [28.0-28.3 Mhz] Only a RTTY or data emission using a specified digital
code listed in 97.309(a) of this Part may be transmitted. The symbol rate
must not exceed 1200 baunds, or for frequency-shift keying, the frequency
shift between mark and space must not exceed 1 kHz.
(5) [6m,2m][125cm was erroneously applied in the June 20 version, but has
been deleted (see 6) in the Sept 27 version] A RTTY, data or multiplexed
emission using a specified digital code listed in 97.309(a) of this Part may
be transmitted. The symbol rate must not exceed 19.6 [not 19.2] kilobauds.
A RTTY, data or multiplexed emission using an unspecified digital code under

the limitations listed in 97.309(b) of this Part may also be transmitted. The authorized bandwidth is 20 kHz.
(6) [125cm,70cm] A RTTY, data or multiplexed emission using a specified digital code listed in 97.309(a) of this Part may be transmitted. The symbol rate must not exceed 56 kilobauds. A RTTY, data or multiplexed emission using an unspecified digital code under the limitations listed in 97.309(b) of this Part also may be transmitted. The authorized bandwidth is 100 kHz.
(7) [33cm and shorter] A RTTY, data or multiplexed emission using a specified digital code listed in 97.309(a) of this Part or an unspecified digital code under the limitations listed in 97.309(b) of this Part may be transmitted.
97.309 RTTY and digital emission codes.
(a)(1)-(3) ...[sections listing specific codes skipped]
(b) Where authorized by 97.305(c) [authorized emission types] and 97.307(f) [bandwidth and baudrate limitations] of this Part, a station may transmit a RTTY or data emission using an unspecified digital code, except to a station in a country with which the United States does not have an agreement permitting the code to be used. RTTY and data emissions using unspecified digital codes must not be transmitted for the purpose of obscuring the meaning of any communication. When deemed necessary by an EIC to assure compliance with the FCC Rules, a station must:
(1) Cease the transmission using the unspecified digital code;
(2) Restrict transmissions of any digital code to the extent instructed;
(3) Maintain a record, convertible to the original information, of all digital communications transmitted.
} end FCC rule quote

My analysis of this tells me that I can use any code I wish to use provided that:
(1) I use 6 meters and above for the transmission, limit my bandwidth to 20 khz on 6m and 2m and to 100 khz on 125cm and 70cm. If I use one of the codes listed in 97.309(a) w/o the limitations in 97.309(b) then I must adhere to the baudrate limitations of 300 (160-12m), 1200 (10m), 19600 (6m,2m) or 56000 (125cm,70cm) baud unless I operate on 33cm or shorter. I do not need to limit my bandwidth on 33cm or shorter.
(2) I do not use it to communicate with any foreign country with which the United States does not have an actual agreement in place to allow the particular code I want to use. I suppose it might be possible for the US to negotiate an agreement allowing ANY code. There should be a list of such countries and what codes are agreed upon for each.
(3) I may not use the code for the purpose of obscuring the meaning. This certainly includes an cypher for which the algorithm and key are not publicly known. Also, if I happen to believe that someone is not capable of receiving any certain particular code and I switch to using that code so he cannot copy my transmission, even though it might be a publicly known code, then I have fallen under the "for the purpose of obscuring the meaning" clause. This is a matter of INTENT and brings with it all the legal vagaries associated with proving intent.
(4) The Engineer In Charge can direct any combination of the listed requirements on my station (not me, the operator). The third requirement

is to maintain a record of what was transmitted (not just what code was used). I am not required to keep this record unless directed to do so by the EIC. Note that by the LETTER of this rule, the EIC can require such a record of ALL digital communications, not just the ones using an uspecified code. While the spirit is apparent to me to be applied to only unspecified codes, I see this as a minor gap in the rules that needs a bit of touching up (petition for rulemaking?).

Further rule nitpicking suggests to me that (in 97.307(f)(3)-(5) applicable to HF frequencies) that EITHER the baudrate limitation applies OR the frequency-shift limitation applies due to the use of the word "or" in the rule text. Since 97.307(f)(2) does not apply to RTTY and data emissions (except in 160m) according to 97.305(c), apparently no bandwidth limitations apply either. So if I have a high baud rate of one of the specified codes, along with the use of frequency shift keying of 1 khz or less, on HF, then the bandwidth will not matter (as no rule paragraphs apply). I believe we call things like this "loopholes". Another petition?

>From: Perry Scott KF0CA
> I think one of the contributions of Amatuer Radio in this area is to squeeze
> more out of RF data networks. So, it is within our charter to request the
> FCC to relax the cipher rule so it doesn't apply to simple compression for
> transmission purposes.

It seems to me, after reading over the rules rather closely, that they are in fact suitable to begin experimentation. Compression codes such as the LZW code fall under the "unspecified" codes and I find them usable within the limitations of 97.305(c), 97.307(f)(5)-(7) and 97.309(b). That rules out using them on HF.

I also believe that I may use checksum and Forward Error Correction codes, as they do not obscure meanings at all where they do not alter the original data. They may still fall under the definition of "unspecified" codes by the LETTER of the rules, which may worry some regarding their use on HF to enhance the reliability of that spectrum. Another petition for rulemaking could clarify this by allowing the appendage of checking, correcting, and authentication codes to the clear data being sent for all specified (and unspecified) codes.

SpaceNews

MONDAY DECEMBER 25, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* UOSAT D/E NEWS *

The UoSAT-D and UoSAT-E spacecraft have been successfully integrated with the Ariane Structure for Auxiliary Payloads (ASAP) and are now waiting for launch on 11 January at 01:34 GMT - alongside SPOT-2 and the four AMSAT Microsats.

The ASAP, UO-D & E and the four AMSAT Microsats shared a large clean room at the Ariane launch complex. With six spacecraft being worked on simultaneously, the scene was one of considerable activity!

The completed composite (SPOT + UoSATs/Microsats + fairing) will remain in the Assembly Hall over the Christmas period. On January 3rd, the composite will be moved to the launch pad and integrated onto the launcher.

Well, since you asked... I've thought about dropping you a note a few times telling you that I really love what you're doing. I've gotten quite a bit out of SpaceNews (I just recently wrote for a copy of the mission charts from SPARK you mentioned) and it's in a format that's really easy to assimilate.

Thanks! And keep up the good work!

Devon

Of course, I forgot to mention that the federal government has a VERY direct enforcement handle on their own internal communications systems.

FidoNet HAM/PACKET Digest, Vol. 1, Number 1 was published several months ago.
The Illinois situation has since changed since then. The bill was watered down
to make it harmless. Nothing was heard about it again, so I don't even know if
it ever even came to a vote. Judging by the lack of protests, I'd guess it died
the death of a rag doll.

I think the logic is there is no standard accepted by all as to what the ASCII characters above 127 are. IBM has their version, Commodore theirs, etc.

I don't know how all this cipher stuff got into the thread. My original question was based on the fact the International Telegraphic Alphabet #5 doesn't define any ASCII characters above 127.

The problem with W1AW coming on and asking if the frequency is in use before transmitting bulletins is that they do this simultaneously on EIGHT BANDS. Of course, no one OWNS a frequency, but they have been doing this on a regularly scheduled basis on the same frequencies since before I was born. It would be a lot nicer for them to ask first, but I am not sure how practical it is.

Source record: 14555
Cross-posted to: rec.ham-radio.swap,rec.radio.swl,rec.ham-radio

I have a Icom R71A receiver with the 250Khz CW filter and the
Icom C64 High stability crystal unit I would like to trade
for a Kenwood R5000.

The Icom has just been tested and benched by Electronic Equipment
Bank in Vienna, VA and has and continues to be a fine performer
for catching weak signals, DX'ing, and cutting out just about
any type of noise you can imagine.

Why do I want to trade it for a R5000? All my friends have a R5000,
I own an old Kenwood R600, and in general, I like the operation
and ergonomics of the Kenwood products better.

I got the Icom at a wonderful price, but still prefer Kenwood products.
So, if anyone is willing to talk trade, I'd like to listen. I'd
pay shipping on both ends and would be open to either a straight
one-for-one trade, or a trade plus equipment or cash... from either
of us.

Make me an offer, let's see if you can make me a deal.

**********About the ARRL**********

In reply to the notes on this BBS concerning the ARRL---
I have been a member on and off for 30 years. I am presently a
member, but have decided not to renew my membership whin it runns out this
January. I do not enjoy QST. I would not mind continuing my membership
without QST...have asked the ARRL if I can do so, but they refused. They
told me that if they give their membership such an option that their
readership and income from QST advertisment would drop so low that
they could not stand it. Hey, hey, that says a lot for their
confidance in QST !! At any rate, most USA hams do not belong to
the ARRL and I can see why! Wonder if there is any way the ARRL would
reconsider and accept members without having to take QST??? I have tried
to "use the system" by being a member and asking my divion director
to try to change things, but he was rather defensive when I tried.

I continue to look forward to and enjoy HAM RADIO....

The following review appeared initially in The Umbra et Lux Newsletter as one in a series of reviews of Radio-related Bulletin Board Systems. It appears here with the permission of the author and publisher and may be reproduced with the stipulation that proper credit is given.

==========

** Bits, Bytes & BBSs **
with
Kristin Kaye

If beacons are your bag, The Long Wave DataBase System, operated by Lynn Ashley, is a BBS which focuses exclusively on the odd tenants of the spectrum below 535 kHz.

There is extensive coverage on this Bulletin Board System of the LORAN and OMEGA Non-Directional Aero & Marine Navigational Beacon Systems, Standard Time Signals and other phenomena long ignored by more traditional radio-related boards.

There is an impressive selection of on-line articles detailing LF/VLF antenna systems, loggings, frequency listings and other topics of interest, and a comprehensive series of pointers to Organizations, Newsletters and other publications of particular interest to LowFERS. Lynn also provides information about other BBSs on related topics, including AMRAD (703-734-1387), FCC (301-725-1072) and the US Naval Observatory (202-653-1079).

The Long Wave DataBase System is accessible via Telenet's DC pathway for PC Pursuit users - at 703-528-7753. One point of interest regarding the DC pathway - it's good for suburban Maryland (301) and Northern Virginia (703) exchanges, as well!

If *LOW*Low*low* frequencies are your thing - you can't do any better than this. Tell Lynn "kk" sent you!

5034. Re: ARRL DX NR 51

Newsgroup: rec.ham-radio
Date: 1989-12-27 01:38:54 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500338@ux1.cso.uiuc.edu>
Source record: 14557

There really is a definite slant on the part of many people in ham radio in favor of HF frequencies over VHF/UHF/SHF/EHF frequencies.

I read a recent article in Popular Communications by an ARRL staffer who was describing what one could get as a first rig in ham radio. Absolutely EVERY rig mentioned in that article is an HF rig. There was NO MENTION whatsoever of what the ham who is primarily interested in any of the many interesting (although not to everyone) and diverse activities in the world above 50 Mhz. There were no 144 Mhz or 220 Mhz HT's mentioned. There were no UHF ATV rigs mentioned. There was no mention of even packet radio. All these kinds of interests are in the range of interest of PopComm readers, yet the article totally focused on the HF bands only, without mentioning that it was specifically addressing the HF interests.

My complaint is not that the article was bad, but rather that because the history of ham radio is rooted in HF, and most of the current older hams were first introduced to ham radio in the HF bands, that these people think of ham radio as "an HF hobby with some ancilliary interest in other things".

This is definitely NOT the case. Many people are genuinely interested in one, some, several, or even all the areas of ham radio that take place above 50 Mhz and may, or may NOT, be concurrently interested in the HF bands.

It is this thick-skulled attitude by many people that think to be a "real ham" you have to be interested in working CW contests on 20 meters and bring in the "rare ones". This is the very attitude that threatens the existence of ham radio by ignoring the bands above 50 Mhz by fighting against such concepts as issuing licenses to operate on bands they don't care for w/o a morse code test.

This needs to change. Ask your fellow hams what they would talk about if they were to give a talk at the local school on the ham radio hobby/service. Would they mention the things that go on above 50 Mhz? Would they even care to nurture the interest of someone who was NOT interested in working DX, learning morse code, contesting, and HF nets?

From: charlie@oakhill.UUCP
Message-ID: <2768@radio.oakhill.UUCP>
Source record: 14561

The city of Austin, TX has installed radio linked stream flood alarms in
our city. Each flood alarm unit is easily identified by the 19" ground
plane scanner antenna sitting atop a brown pole about the size of a tele-
phone pole. I presume that these little beasties remain silent until
the water level reaches a certain predifined depth. Has anybody got
any information on frequencies for these things? It would be nice
to know what frequency the flood alarm in my neighborhood is on.

Thanks in advance.

5037. Capacitance Meter Stuff (Long)

Newsgroup: rec.ham-radio
Date: 1989-12-27 20:42:20 UTC
From: adams@swbatl.UUCP
Message-ID: <1077@swbatl.UUCP>
Source record: 14560
Cross-posted to: sci.electronics,sci.physics,rec.ham-radio

I posted an article requesting info about capacitance meters a while back. I got no response with the exception of a helpful message from Bob Parnass and a request to send info on home-made capacitance meters. So I went out and collected a lot of info on Capacitance and Inductance Meters and Bridges.

I summarize that info at the end of this article in the hopes it will help someone, or someone will find a better deal, or suggest alternative manufacturers. I'm still undecided which meter I'd buy, but building one is starting to look better and better, given commercial cost and the apparent ease of doing so.

I have an article (Cap Checker by W.S Gardiner (VE6BGL) in Mar/87 73 Magazine) with instructions for an extremely easy looking (1 pf to 50uF) analog capacitance meter. This meter uses a crystal oscillator, divided down to various values by 7490's and then measures the capactive resistance at an appropriate frequency.

```
C (unknown)
[~]----)|---+ Where [~] is the 7490's and stuff providing
| assorted frequencies {f: 1hz, 10hz, 100hz ... 1Mhz}
+--+------>|---+-->|-+ and )| is a cap, >| a diode, [M] a meter, etc.
_|_ | |
/// | .1 |
+------)|---------+ I assume the appropriate eqn is
| | Xc = -1/(2 pi f C)
| 1mA |
+-----[M]---------+
```

What I don't understand is the role of the diodes and the .1mF capacitor. I also don't see how the 1mA full scale deflection was chosen. (i.e. what happened to pi?)

I do see how easy it should be to measure inductance with a Q-meter; and how easy such a meter is to build, given a known frequency and a capacitance meter.

```
L R
+--()()()--/\/\/\-------+ Where Variable Cap C is tuned to Maximimum
| | | Voltage on Meter M, and Unknown Inductance
[~] | [M] L = 1/[ (2 pi f ) C ]
| C / | |
+-------)/|--------+ |
| / |
+-----------------------+
```

Seems that with a 555, some judicious values of f and careful choice of value and range of C that an inductance meter is almost trivial if one can reasonably accurately measure C.

It also would seem I could build an inductance meter into a "Cap Checker" fairly easy, perhaps first measuring the the unknown resonant capacitance at one of the available frequencies, then using that in the resonance equation, or somehow producing a calibrated deflection.

Am I missing some large gotcha? How would one figure out values for the meter part of a Q meter? Why are commercial units so expensive?

Damned if I understood much of this a week ago and my "Principles of Electronic Instumentation" suggests a voltage divider to measure capacitance, switching a volt meter between voltage across the source and known cap values and using:

V / V = C / (C + C)
known cap source unknown known unknown

Which doesn't seem to be what the Cap Checker is based upon.

It then goes on to say this won't work for inductance, because of unknown "mutual inductance" between the known and unknown inductors and recommends the Q meter approach. Say What?

I realize this is probally *old* hat to you guys, but it's getting to be fun for this bored old systems grunt to learn these basics. Apologize for thinking out loud here, hope someone else is interested.

Here is the list I worked up for prices and ranges.
With the Xmas holidays I couldn't get any info on Fluke, or full lines from Beckman and some others. I also left off resolution and voltage, current and resistance ranges, though most units had similar values (~ 200-20M Ohms 200mV-1000V, .200uA - 100ma, or 10A). If someone sees something much better, please let me know. Check out the B+K 2906, and 388-HD.

WRONG! WRONG! WRONG!
AX25L2V2 which is one of the FCC specified codes is an OCTET based code and
is most certainly an eight bit code that is specifically allowed on HF by
the FCC. Read the specs for AX25 yourself. If AX25 weren't an eight bit
code we wouldn't be sucessfully shipping megabytes of binary executable
program code around Atlanta every day with our high speed modems. Just
because the unexcusablely poor USER INTERFACE programmed into box stock
TNCs makes it DIFFICULT to send binary files doesn't mean it's illegal.
Get a KISS ROM and "run light without overbyte".

5039. A question about receiver components

Newsgroup: rec.ham-radio
Date: 1989-12-28 01:29:58 UTC
From: dbraun@cadev5.intel.com
Message-ID: <1410@mipos3.intel.com>
Source record: 14562
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I have a shortwave radio that a recently rescued from my parent's place.
It is a Heathkit GR-78 general coverage receiver that I built about
12 years ago. It's not a bad radio, but I was thinking of doing something
to improve it.

The IF section is at 455 KHz, and it uses four of these little creamic
filters for the filtering. I would like to modify the circuit to have
something fancier, such as a crystal IF filter. Does anyone have information
on where I can get these sort of parts?

Two possibilities have presented themselves:

1: Collins mechanical filters. Where can I get these? Hamfests?
Someone told me they would be quite expensive ($150).

2: Could I build some sort of network out of these ceramic filters?
I can get lots of them cheap. I guess these electrically look
something like a quartz crystal, but with a lower Q.
I saw a vague reference in the ARRL handbook that you can make
"a crystal filter in a ladder configuration, where all crystals
are cut to the same frequency". Could I do the same thing with
ceramic filters? Where do I find more information on this sort
of thing?

If anyone has some advice or references that would help me,
please let me know.

These sorts of alarm widgets are often stuck on the same itinerant mobile channels as other low-power stuff; check out 154.6 and the other Burger King sort of channels. It's hard to say particularly.

If it's a Motorola Radius 100 alarm radio, there's a voice synthesizer in there and a 2-watt highband (150MHz) transceiver. I suppose the competition makes similar widgets.

You could always take your scanner along and spray the thing with a hose (just kidding).

I'm listening to this evening's English-language Radio Bucharest broadcast. The best frequency seems to be 9570 KHz, although even this one has a lot of QRM and fading here on the East Coast. If I interpret my WRTH correctly, their transmitter is in central Yugoslavia. The schedule they gave at the close of the broadcast matches that in the 1989 WRTH.

If I didn't know better, from all the joyous rejoicing and talk of conquering the Dark Forces of Evil, I'd think I was listening to the end of Star Wars (the movie).

Phil

I looked in 97.309(a) and couldn't find it listed as "specified". Does your copy say that? My copies only reference to AX.25 or packet was in 97.109(e).

What this means to me is that the "Information" field of the packet must contain a "specified" code. If this is wrong, why don't we list AX.25 Information field description as a specified code? What does AX.25 say about the 256 Information Octets (concerning the eighth-bit)? I don't mean to be restricting you in any way, if you haven't got a pink slip yet, maybe the FCC doesn't care, and more power to you.

The new request for rulemaking by the ARRL to allow AUTOMATIC CONTROL of HF Digital Communications is a proposal much needed. HOWEVER, I am concerned that the "CW Good Ol' Boys" have influenced it improperly in one regard; The proposed sub-bands are far to small. 10Khz. on the more popular bands is just inviting an unusable system as demand for HF digital relay requirements increase. I think we should open the entire General/Advanced CW sub-bands to Automatic Digital and Half of the 10M Novice subband (Maybe we require Tech or Above license in the novice subband). If not the full subbands then at least half. This leaves the Extra class segments for CW and attended Digital -- This should leave a good "incentive" for CW users to upgrade to Extra.

Also this same rulemaking should be the place where we change the transmission SPEED rules to BANDWIDTH rules.

Perhaps we create higher bandwidth subbands in some of the Automatic Digital subbands.

Comments? (Send them to the FCC as well)

I lost the mailing address of the person who asked about S01MZ. I sent a card via KV4AM, as directed by the operator, and just got it back today with a note saying that KV4AM was indeed on 15m cw at that time but as VP2EM, and 40 KHz lower than S01MZ, so there can't have been any confusion. Anybody know any more about this? I'm counting it as a fake at the moment, along with the ST0 who showed up on 20 cw recently (ST0IQ/PA3CXC - the DX bulletins say this one was a 'real fake'). Oh well, it's more towards my DXCC-Pirates award.

Also of relevance: with a 555 and some resistors, plus a frequency counter
(which is trivial to build), you *have* a capacitance meter. Just build
an RC oscillator and measure the output frequency. Mind you, you need a
bit of arithmetic to go from frequency to capacitance, but a $10 calculator
solves that unless you're measuring lots of capacitors and speed is important.
(Our old electronics wizard, now retired, pointed this out to me during a
discussion of cheap test equipment.) It may not give you five-digit accuracy,
but capacitor values are seldom that crucial (and can seldom be depended on
to be that stable) anyway.

(edited by me for bandwidth sake)

Why should I subscribe to their formal operations guides, if the ultimate 'big gun' transmitters are operated in such an impolite manner? They have an operator there, that's why they are there. Otherwise, just let a computer bang the signal out over any unlucky person. Really, if they expect credibility, then their operating manners should be impeccable. "It's always been that way" or "it's hard to do" are not valid excuses.
PS: I am a member, I can gripe. However, I have not personally witnessed one of these incidents.

>1972: Saturn V #15 flight-ready| Henry Spencer at U of Toronto Zoology
There is a certain similarity in the equations of RC behavior and
those of LC behavior that leads to an extension of this idea; one '555
oscillator circuit uses a resistor to the output for charging the capacitor
and (of course) discharging it, making the '555 a true RC oscillator;
with a bit of buffering (I'd suggest a 74HC04 with several sections
paralleled), it would be simple to make an RL oscillator which, instead
of driving the '555 with a voltage on the capacitor, drives it with the
voltage on a resistor (i.e. the current in an inductor for which that
resistor is a current sense resistor). The only weakness of this scheme
is that the resistor must be grounded to the midpoint of the '555
power rails, instead of to the negative rail (as the capacitor in the
RC oscillator is). As an RL oscillator, the output frequency will be
proportional to R and inversely proportional to L (with constants
that might depend on the individual '555). The test currents in the
coil, of course, must be kept within the 74HC04's limits (for five
paralleled sections, this should be about 25 mA with no trouble). The
output resistance of the 'HC series gates is low enough (20 Ohms) that
the sense resistor can be chosen in the range of 50 Ohms to 100 kOhm,
or to 2MOhm with a CMOS '555.
Lest I be unclear, a '555 is a timing circuit similar to the
Signetics NE555 and its generic imitators, and a 74HC04 is a fast
CMOS inverter with six individual sections, here used as a buffer
amplifier for its high frequency response and low output impedance,
as well as for its elegant saturation characteristics (jam them
little MOSFETs ON and watch the juice flow!).
The best commercial LCR bridges use phase-shift measurements
with internal tone generators (low-distortion sine wave generators)
to measure the second parameter, i.e. both the L of a coil AND its
(stray) resistance, or the C of a capacitor AND its ESR, equivalent-
series-resistance, at the test frequency. For critical work, they
might be well worth the few hundred dollars they cost.

I am known for my brilliance, John Whitmore
by those who do not know me well.

5057. Re: Packet compression, what issue?

Newsgroup: rec.ham-radio

The fundamental problem, IMHO, is that the FCC simply doesn't have the foggiest appreciation of the fact that amateur packet radio is much more than a hi-tech form of RTTY. (This also seems true of the average ham, BTW.)

What does the term "character code" mean when what you're transmitting isn't textual information, but an executable computer program? A digitized image? Digitized speech? It's completely without meaning in those contexts, so don't try to give it one!

The FCC's sad ignorance of what amateur digital communications is all about also shows up in their definition of "data emission" and the HF frequencies on which it can be used. As I read the present (new) rules, the transmission of a digitized picture (e.g., a GIF file) could qualify as EITHER an "Image" transmission or a "Data" transmission. The problem is that, except for 160m, "Image" transmissions are restricted to the "phone" bands while "Data" transmissions are restricted to what are commonly called the "CW" bands (i.e., segments where phone isn't allowed.) So does that mean I can send my GIF files anywhere I want on the 80-10m HF bands? Nowhere?

I have repeatedly tried to pursue these fundamental ambiguities both through my membership on the ARRL Digital Committee (chaired by Paul Rinaldo) and through participation in an ad-hoc committee chaired by Steve Mendelsohn (Hudson Division Director) during the summer of 1988 that was helping prepare the League's response to the rule rewrite docket. In each case I was told that while my concerns were valid, the only truly workable solution (doing away with emission designations altogether and regulating solely on the basis of bandwidth) was considered "too radical" for what was only supposed to be a content-neutral restructuring of the rules. (Actually, if I were to suggest a rule change now, it would be to regulate subband emissions on the basis of "minimum spectral efficiency", not "maximum occupied bandwidth". :-))

I still find it hard to understand the whole point behind the rules rewrite, the stated purpose of which was to "update" the rules and remove ambiguous and outdated language and unnecessary restrictions, when a known problem as fundamental as this one could not be addressed. I've come to the conclusion that the whole exercise was pretty much a complete waste of time. The rules did need comprehensive updating. Sadly, they still do.

Phil

I challenge you to prove that the "squelch burst" you hear at the end of
each user's transmission on a given FM voice repeater isn't actually
a burst of securely encrypted data. :-)

Seriously, although you *may* be able to prove that a given signal contains
information, you can never prove that it doesn't (without knowledge of
how it was generated, of course.)

Phil

Does anyone have the newer dual band radio from Kenwood (TM-701)?
It is a relatively small radio (same size and case style as -231
and -431 radios). I'm wondering if it has the 2m<->70cm repeater
capability that the -721 has... I currently have the -221 in
my mobile (cut into the dash...) and the -701 would be a
"drop-in" replacement. I'd like to use it as repeater from my
UHF HT to my favorite 2m simplex freq if at all possible--

73, Chris N0JCF

Why not? There are folks out there who insist on having their net/QSO on
THEIR frequency, no matter what. If someone else is in their, tough. Just
QRO and pretend you can't hear them.

Not everyone's like that, fortunately. FOWO (From One Who Knows) - I run
25W on 10m mobile.

Charlie:

AMSAT and TAPR proposed to the ARRL that we institute a no code license. The ARRL put together a panel of some diversity and studied the issue. They have sent a proposal for a no code license to the FCC which has not acted on it yet.

Hopefully soon!

Happy New Year!

Bob

From article <26897@sequent.UUCP>, by brians@sequent.UUCP (Brian Sheets):
> Is there now in orbit or will there be a packet node on an OSCAR sat?

Brian:

On Jan. 11, 1990 at 0135 UTC we will launch six amateur radio satellites on board an Ariane 4 along with the primary payload, Spot-2. Three of the satellites are dedicated to packet radio experiments. Two Microsats, PACSAT and LUSAT are store and forward packet radio satellites designed and built by AMSAT-NA. AMSAT-LU designed an experiment for, paid for, and send LU7JCN to the states to work on LUSAT. We in fact exploited his great talent and he worked on all the spacecraft. The other packet radio payload is UOSAT D which is designed and built by the folks who brought you OSCAR 9 and 11, the space engineering unit at the the University of Surrey in Guildford, Surrey, England. The other two microsats carry other experiments as their primary payloads, but again, they are packet oriented systems with all telemetry and experiment data being sent down to earth on packets. The DOVE microsat is an educational payload. DOVE stands for Digital Orbiting Voice Encoder. I am the primary experimenter onboard that payload and it was built for and paid for by PY2BJO, Junior de Castro a philanthropist and long time AMSAT supporter from Brazil. This satellite will talk to earth in synthesized voice. It also has a D/A and can reproduce digitized waveforms. For those of you with REGULAR unmodified TNC's this bird may be your entry into packets from space. It transmits is digital information, telemetry, etc. down to earth in regular BEL-202 tones just like regular tnc's. The frequency for this bird is 145.825 Mhz. It carries a powerful FM transmitter and should be easy copy (by ear) on a HT with a rubber duck. If you want to decode data you should have a slightly better antenna. The final satellite, and by no means the least, is WEBER. This bird carries a color CCD camera. It has a flash digitizer board which is triggered by a vertical sync and then captures a single frame in its memory. This set of digitized picture elements will be sent down on AX.25 UI frames (beacon frames) on 437.075 or 437.100 using binary PSK (standard TAPR-PSK, or G3RUH psk modem) at 1200 BPS or 4800 bps. At beginning of life, it will be strictly 1200 bps.

I will turn on all four spacecraft at about 0300Z as the spacecraft cross over the equator going north. This orbit will carry the satellites over the panhandle of Florida and northward over the eastern US. The next orbit over the US will occur around 0530 UTC and will go up over west Texas, Colorado, etc. The next will be just off the west coast.

I will be posting a set of group elements that ought to be good for all seven payloads for at least the first two weeks, here and on other forums.

5064. Multiband (80-10m) vertical antennas

Newsgroup: rec.ham-radio
Date: 1989-12-29 19:29:01 UTC
From: Allyn@cup.portal.com
Message-ID: <25486@cup.portal.com>
Source record: 14488

Does anybody have any suggestions for a good 80-10m vertcal?

I'd like to see the advantages and disadvantages of various brands...

thanks!

Allyn Lai

5065. IC-32AT Expanded xmit range??

Newsgroup: rec.ham-radio
Date: 1989-12-29 19:52:58 UTC
From: faunt@CISCO.COM
Message-ID: <9001021843.AA05017@ucbvax.Berkeley.EDU>
Source record: 14489
Body handling: HTML body converted to readable text

MODS FOR ICOM 32AT

1. Remove battery and antenna.
2. Loosen two screws on top of unit as much as possible without removing them.
3. Loosen 4 flat head screws on bottom of unit 1 turn.
4. Loosen 2 screws near PTT switch 1 turn.
5. Remove 4 black screws on back of unit.
6. Lift bottom of front cover .25 inch, slide it down .25 inch, then lift
front cover up 1 inch.
7. Disconnect plug on 4 wires coming from the speaker.
<< THe flex cable can be disconnected from the main board by gently
pulling up on the ears of the connector for that cable on the main board>>
8. Lay front panel on table up-side down being careful of the flex circuit.
9. All mods are done to the back of the front panel. Notice places for 5
axial diodes, which I will call 1 through 5, 1 being nearest the display.
<>
Add/remove diodes so there are diodes in positions 3 and 5. This will
open up receive coverage for VHF & UHF and enable keyboard entry of the
10 MHz digit.
<< I seemed to have the same coverage with and without diode #3 installed>>

When you go out of the range the radio will receive a U appears in
place of the memory channel number. It means the PLL circuit has
lost lock and the radio will not work.

10. Notice 4 surface mount resistors slightly left of center directly
above the speaker, lined up in a row. Solder the anode (the side
without the bar) of two diodes to the right side of the lower of
the four resistors.
<>
Now find the CPU. It's the PGA under the shield near the top of
the board. Find the row of pins on the CPU nearest the speaker.
Notice the the 8th pin from the right has a thicker trace coming
from it. Now notice that there are small solder pads about .25
inch toward the speaker on both the fat trace and the two traces
to the right of it. Solder one each of the cathodes of the 2
diodes to the solder pads on the two smaller traces.
This will open up the transmit for VHF & UHF.
<< Oh yes, note that memory channels clear when you do these. And the
<>

11. Put unit back together in reverse order.

This procedure worked for my unit, but I can't guarantee it will work
for yours.

<>

Last but not least to enable cross band repeating first choose a pair of frequencies with the two vfo's for VHF and UHF.Then press and hold function key while pressing with the other hand the following "C" "6" "D". The radio will start scanning the two frequencies continiously, if a station is heard in one of the two it will retransmitted from the other! The two frequencies must be simplex, no cross band repeaters yet sorry!

WR0Y, SV1IW, N1BIP, NV7F, and N7HMF all contributed to this.

> subband). If not the full subbands then at least half. This leaves the
> Extra class segments for CW and attended Digital -- This should leave a
> good "incentive" for CW users to upgrade to Extra.

How about a new license class for CW gurus: CODE MASTER class, where one only needs the general theory, but passes 30 WPM to get access to the Extra portion of the CW band (but not any other Extra privs and not the calls).

Ya know... the expanding packet radio usage is impacting existing CW usage more than it is impacting voice. The sharing of CW and RTTY/digital is not necessarily so good an idea.

Maybe we should have specific subbands for certain traditional modes, and open the rest of each band for bandwidth limitations only.

> Also this same rulemaking should be the place where we change the
> transmission SPEED rules to BANDWIDTH rules.
>
> Perhaps we create higher bandwidth subbands in some of the Automatic
> Digital subbands.

How about some spread spectrum, too? Seriously!
But this will complicate the rules on bandwidth limitations. What measures exist for efficiency of SS emissions?

TexNet is an interconnection alternative. It provides (at least in the implementation here in the Dallas area) multi-user connects, Message Service, conference bridges, trunking to other cities, and a National Weather Service database.

Drop Greg a note or Email, he can get you detailed information.

I saw one of these at a local shop at a reasonable (I think!) price.
It tunes from 150kHz-520MHz, and seems to have reasonable features
for a portable. Does anyone know anything about this product?

Please respond by mail, as it doesn't appear to be a very common receiver,
so I doubt it would be of general interest.

thanks,
Don

John,

As a member of the ARRL Digital Commitee, I was present at the meeting in Colorado Springs a few months ago when this proposal was discussed. (The meeting also included members of the ARRL Membership Services Committee.)

Far from being unduly influenced by the CW crowd, the choice of relatively narrow subbands for the (initial) stab at unattended operation was made mainly to placate the users of the foreign phone bands. The HF bands are *crowded*, and we thought it prudent to keep things on a small scale for the time being lest we incur the wrath of the rest of the world.

Phil

* MIR NEWS *

The Soviet Union's Progress M-2 cargo craft successfully docked with the Mir orbital complex on 22-Dec-89 according to Radio Moscow. The Progress, which was launched on 20-Dec-89 at 6:31 AM Moscow Time (10:31 PM EST), carries about 2.5 tons of food/water/fuel and equipment to the station. It is also the first craft to dock with Mir in its new mode with the Kvant 2 module positioned to the side of the station. This should make the combined mass of the station complex at about 70.5 tons.

One of the main events of this Progress launch is the addition of protein crystal growth experiment which is paid for Payload Systems, a Cambridge, Massachusettes based space materials processing company. These experiments take several weeks of zero G growth to crystallize samples for materials processing (hence the need for Mir space station processing). The cosmonauts will bring the samples back with them on 19-Feb-90 when they return from Mir.

Meanwhile, cosmonauts Alexander Viktorenko and Alexander Serebrov have finished successfully activating the Kvant-2 module. The last task was to degrease the VIKA (called electron in the west) system which generates oxygen by electrolysis of water. This should enhance their life support system and reduce some of the supply needs. TV pictures from within the module show it to be spacious but with a large number of boxes floating around. These must contain equipment for future experiments. Photos out the port hole showed the solar panels of Kvant-2. The cosmonauts have also started a new series of X-ray telescope observations upon supernova remnants from the Kvant-1 astrophysical module. Viktorenko and Serebrov have been on Mir for 118 days.

There are a number of packages available for hams under AmigaDos. Most
are scattered on the Fred Fish disks. There is an outfit which sells ham
related software for both IBM and Amiga that advertises in 73 fairly often.
It seems to be a fairly shoestring operation but the stuff does show up in
the mail and it's all shareware and cheap. I can't remember their name now
but it seems the ad has a picture of a pig at the top.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

5074. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1989-12-30 23:43:15 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9001030803.AA24060@ucbvax.Berkeley.EDU>
Source record: 14498

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

5075. Re: Flood alarm frequencies

Newsgroup: rec.ham-radio
Date: 1989-12-31 00:42:42 UTC
From: wb2hbz@ka2qhd.UUCP
Message-ID: <77@ka2qhd.UUCP>
Source record: 14499

In a recent article, charlie@oakhill.UUCP (Charlie Thompson @
Motorola Inc. Austin, Tx), writes:

>The city of Austin, TX has installed radio linked stream flood alarms in
>our city. Each flood alarm unit is easily identified by the 19" ground
>plane scanner antenna sitting atop a brown pole about the size of a tele-
>phone pole. I presume that these little beasties remain silent until
>the water level reaches a certain predifined depth.

Charlie,

What you are probably looking at is an IFLOWS sensor. IFLOWS, the Integrated
Flood Overflow Warning System, is a system that hourly, reports temperature,
precipitation and river/stream levels.

Most of the installations around the country are working in the 450 MHz
range (approximate). They are using their own breed of packet radio
for communication and control. From local control points, usually a
county sheriff's office, there are satellite links to the NWS systems
in Harrisburg, PA.

Supposedly, although I have not found out how yet, I should be able
to find out about almost anywhere in the USA with a history of
repetitive flooding. The system also provides local weather reporting.

Although local weather reporting may not seem significant, an alarm
sequence is transmitted when severe weather is expected or detected.
This in turn allows the IFLOWS system to automatically notify what
are known as "High Risk Municipalities." Alerts are issued either by
a local system or from Harrisburg or from an area NWS office.

Other than local weather reports, here are a couple of reports available
from this system:

5076. Re: Mac vs IBM (and now "vs Amiga")

Newsgroup: rec.ham-radio
Date: 1989-12-31 16:20:47 UTC
From: louie@sayshell.umd.edu
Message-ID: <1989Dec31.162047.3632@haven.umd.edu>
Source record: 14500

For the stout of heart: If you are interested in testing a port of the NOS code for the amiga, a version can be obtained via anonymous FTP from TRANTOR.UMD.EDU in /pub/amiganos.zoo. Source code is included. It is assumed that you know how the NOS version of Phil's TCP/IP differs from the previous NET package, or that you can read the source code to figure out how to use it.

If you find any bugs, I'd expect that you'd provide fixes and not just bug reports. This is most definately not a "finished" port of the code, just a snapshot of some work in progress. It is only available via anonymous FTP, and it is too large to mail, so please don't ask. If you don't have access to the internet, please find someone that can grab it for you. I really don't have to time to respond to individual requests for the code.

To compile this code (an executable is also provided), you'll need Lattice C, version 5.02 or later and a hard disk. The sources and object code are too large to build on a floppy. If you make modifications to this code, please clearly indicate that you have in the source code as well as the banner that is displayed when the program starts. I've been blamed for the misfeatures of hacks to my code before (an earlier port of the NET code to the Amiga), and I'd rather not be in that position again.

This is a version the corresponds to NOS version 890830 or so. I'm working on porting a later version once it settles down somewhat. Thanks again to Phil Karn, KA9Q for making this code available source form so that as many people as possible can benifit from it.

As I recall, one of the very first issues of '73 Magazine', lo these many moons ago, had an article on a simple capacitance meter. I forget the details.

What a charming way to win friends and influence people in high places...

I think the FCC is willing to give W1AW slack here because of their unquestioned value as a medium for distributing bulletins, announcements of special FCC orders regarding ongoing emergencies, etc. Since it is well known that W1AW has been using pretty much the same frequencies for decades, one might ask if some people are 'volunteering' to be QRM'ed.

Well, I guess it's UseNet Ad Hoc Committee time again, a la the no-code proposal. Volunteers, take one step forward.

And while we're at it, let's clear up that ITA #5 business and a bunch of other stuff.
